EARTH, FIGURE OF THE. The ancients had various opinions as to the figure of the earth: some, as Anaximander and Leucippus, held it cylindrical, or in the form of a drum: but the most general opinion was, that it was flat; that the visible horizon was the bounds of the earth, and the ocean the bounds of the horizon; that the heavens and earth above this ocean were the whole visible universe: and that all beneath the ocean was Hades. Of this opinion were some of the Christian fathers, as Lactantius, St. Augustine, &c. Such of the ancients however as understood any thing of astronomy, and especially the doctrine of eclipses, must have been acquainted with the round figure of the earth; as the ancient Babylonian astronomers, who had calculated eclipses long before the time of Alexander, and Thales the Grecian, who predicted an eclipse of the sun. It is now indeed agreed on all hands, that the form of this terraqueous fabric is globular, or very nearly so. See **ASTRONOMY**. The round figure of the earth is evident from the eclipses of the sun and moon; in all of which the earth's shadow always appears circular upon the face of the moon, what way soever it be projected, whether E. W. N. or S.; and howso-

ever its diameter vary, according to the greater or less distance from the earth. The spherical figure of the earth is also evinced from the rising and setting of the sun, moon, and stars; all which happen sooner to those who live to the E. and later to those living to the W. and that more or less so, according to the distance. So also, going or sailing to the N. the north pole and northern stars become more elevated, and the south pole and southern stars more depressed; the elevation northerly increasing equally with the depression southerly; and either of them proportionably to the distance gone. The same thing happens in going to the S. Besides, the oblique ascensions, descensions, emersions, and amplitudes of the rising and setting of the sun and stars in every latitude, are agreeable to the earth's spherical form: all which could not happen if it were of any other figure. The roundness of the earth is further confirmed by its having been often sailed round: the first time was in 1519, when Ferd. Magellan made the tour of the whole globe in 124 days. In 1557 Sir Francis Drake performed the same in 1056 days; in 1586, Sir Thomas Cavendish performed it in 777 days; Simon Cordes, of Rotterdam, in 1590, in 1575 days; in 1598, Oliver Noort, a Hollander, in 1077 days; Van Schouten, in 1615, in 749 days; Jac. Heremites and John Huygens, in 1623, in 802 days; and many others have since performed the same navigation, particularly Anson, Bougainville, and Cook; sometimes sailing round by the E. sometimes by the W. till at length they arrived again in Europe, from whence they set out; and in the course of their voyage, observed that all the phenomena, both of the heavens and the earth, correspond to, and prove this spherical figure. The natural cause of this sphericity of the globe is, according to Sir Isaac Newton, the great principle of attraction, with which the Creator has endued all the matter in the universe; and by which all bodies, and all the parts of bodies, mutually attract one another. This is also the cause of the sphericity of the drops of rain, quicksilver, &c. The inequality of the surface of the earth, by mountains and valleys, is nothing considerable: the highest eminence being scarce proportionably equivalent to the minutest protuberance on the surface of an orange. It differs however, from a perfect sphere, its shape being that of an oblate spheroid, so that the axis from pole to pole is less than the equatorial diameter. What gave the first occasion to the discovery of this figure of the earth, were the observations of some French and English philosophers in the East Indies, and other parts, who found that pendulums, the nearer they came to the equator, performed their vibrations slower: from whence it follows, that the velocity of the descent of bodies by gravity, is less in countries nearer to the equator; and consequently that those parts are farther removed from the centre of the earth, or from the common centre of gravity. See the History of the Royal Academy of Sciences, by Du Hamel; p. 110, 156, 206; and l'Hist. de l'Acad. Roy. 1700 and 1701.—This circumstance put Huygens and Newton upon finding out the cause, which they attributed to the revolution of the earth about its axis. If the earth were in a fluid state, its rotation round its axis would necessarily make it put on such a figure, because the centrifugal force being greatest towards the equator, the fluid would there rise and swell most; and that its figure really should be so now, seems necessary, to keep the sea in the equinoctial regions from overflowing the earth about those parts. See this curious subject well treated by Huygens, in his discourse *De Causa Gravitatis*, p. 154, where he states the ratio of the polar diameter to that of the equator, as 577 to 578. And Newton, in his *Principia*, first published in 1686, demonstrates, from the theory of gravity, that the figure of the earth must be that of an oblate spheroid, generated by the rotation of an ellipse about its shortest diameter, provided all the parts of the earth were of an uniform density throughout; and that the proportion of the polar to the equatorial diameter of the earth, would be that of 689 to 692, or nearly that of 229, to 230, or as .9956522 to one. This proportion of the two diameters was calculated by Newton in the following manner: Having found that the centrifugal force at the equator is one 289th of gravity, he assumes, as an hypothesis, that the axis of the earth is to the diameter of the equator as 100 to 101, and thence determines what must be the centrifugal force at the equator to give the earth such a form; and finds it to be four 505ths of gravity: then, by proportion, if a centrifugal force equal to four 505ths of gravity would make the earth higher at the equator than at the poles by one hundredth of the whole height at the poles,

a centrifugal force that is one 289th of gravity will make it higher by a proportional excess, which by calculation is one 229th of the height at the poles; and thus he discovered, that the diameter at the equator is to the diameter at the poles, or the axis, as 230 to 229. But this computation supposes the earth to be every where of an uniform density; whereas if the earth is more dense near the centre, then bodies at the poles will be more attracted by this additional matter being nearer; and therefore the excess of the semidiameter of the equator, above the semi-axis, will be different. According to this proportion between the two diameters, Newton farther computes, from the different measures of a degree, that the equatorial diameter will exceed the polar by 34 miles and one-fifth. Nevertheless, Messrs. Cassini, both father and son, the one in 1701, and the other in 1713, attempted to prove, in the *Memoirs of the Royal Academy of Sciences*, that the earth was an oblong spheroid: and in 1718 M. Cassini again undertook, from observations, to shew that, on the contrary, the longest diameter passes through the poles; which gave occasion for Mr. John Bernoulli, in his "*Essai d'une Nouvelle Physique Celeste*," printed at Paris in 1735, to triumph over the British philosopher, apprehending that these observations would invalidate what Newton had demonstrated. And in 1720, M. De Mairan advanced arguments supposed to be strengthened by geometrical demonstrations, farther to confirm the assertions of Cassini. But in 1735, two companies of mathematicians were employed, one for a northern, and another for a southern expedition, the result of whose observations and measurement plainly proved that the earth was flattened at the poles. The proportion of the equatorial diameter to the polar, as stated by the gentlemen employed on the northern expedition for measuring a degree of the meridian, is as 1 to 0.9891; by the Spanish mathematicians as 266 to 265, or as 1 to 0.99624; by M. Bouguer as 179 to 178, or as 1 to 0.99441. As to all conclusions, however, deduced from the length of pendulums in different places, it is to be observed, that they proceed upon the supposition of the uniform density of the earth, which is a very improbable circumstance; as justly observed by Dr. Horsley in his letter to Capt. Phipps: "You finish your article, he concludes, relating to the pendulum with saying, 'that these observations give a figure of the earth nearer to Sir Isaac Newton's computation, than any others that have hitherto been made;' and then you state the several figures given, as you imagine, by former observations, and by your own. Now it is very true, that if the meridians be ellipses, or if the figure of the earth be that of a spheroid generated by the revolution of an ellipse, turning on its shorter axis, the particular figure, or the ellipticity of the generating ellipse, which your observations give, is nearer to what Sir Isaac Newton saith it should be, if the globe were homogeneous, than any that can be derived from former observations. But yet it is not what you imagine. Taking the gain of the pendulum in latitude $79^{\circ} 50'$ exactly as you state it, the difference between the equatorial and the polar diameter is about as much less than the Newtonian computation makes it, and the hypothesis of homogeneity would require, as you reckon it, to be greater. The proportion of 212 to 211 should indeed, according to your observations, be the proportion of the force that acts upon the pendulum at the poles, to the force acting upon it at the equator. But this is by no means the same with the proportion of the equatorial diameter to the polar. If the globe were homogeneous, the equatorial diameter would exceed the polar by one 230th of the length of the latter: and the polar force would also exceed the equatorial by the like part. But if the difference between the polar and equatorial force be greater than one 230th, (which may be the case in an heterogeneous globe, and seems to be the case in ours), then the difference of the diameters should, according to theory, be less than one 230th, and vice versa. I confess this is by no means obvious at first sight; so far otherwise, that the mistake, which you have fallen into, was once very general. Many of the best mathematicians were misled by too implicit a reliance upon the authority of Newton, who had certainly confined his investigations to the homogeneous spheroid, and had thought about the heterogeneous only in a loose and general way. The late Mr. Clairault was the first who set the matter right, in his elegant and subtle treatise on the figure of the earth. That work hath now been many years in the hands of mathematicians, among whom I imagine there are none, who have considered the subject attentively, that do not acquiesce in

the author's conclusions. In the second part of that treatise, it is proved, that putting P for the polar force, Π for the equatorial; δ for the true ellipticity of the earth's figure, and ϵ for the ellipticity of the homogeneous spheroid.

$$\frac{P - \Pi}{\Pi} = 2\epsilon - \delta; \text{ therefore } \delta = 2\epsilon - \frac{P - \Pi}{\Pi}$$

and therefore, according to your observation, $\delta = \frac{P - \Pi}{\Pi}$. This is the just conclusion from your observations of the pendulum, taking it for granted, that the meridians are ellipses: which is an hypothesis, upon which all the reasonings of theory have hitherto proceeded. But plausible as it may seem, I must say, that there is much reason from experiment to call it in question. If it were true, the increment of the force which actuates the pendulum, as we approach the poles, should be as the square of the sine of the latitude, or, which is the same thing, the decrement, as we approach the equator, should be as the square of the cosine of the latitude. But whoever takes the pains to compare together such of the observations of the pendulum in different latitudes, as seem to have been made with the greatest care, will find that the increments and decrements do by no means follow these proportions; and in those which I have examined, I find a regularity in the deviation which little resembles the mere error of observation. The unavoidable conclusion is, that the true figure of the meridians is not elliptical. If the meridians are not ellipses, the difference of the diameters may indeed, or it may not, be proportional to the difference between the polar and the equatorial force; but it is quite an uncertainty, what relation subsists between the one quantity and the other; our whole theory, except so far as it relates to the homogeneous spheroid, is built upon false assumptions, and there is no saying what figure of the earth any observations of the pendulum give." Dr. Horsley then lays down the following table, which shews the different results of observations made in different latitudes; in which the first three columns contain the names of the observers, the places of observation, and the latitude of each; the fourth column shews the quantity of $P - \Pi$ in such parts as Π is 100000, as deduced from comparing the length of the pendulum at each place of observation, with the length of the equatorial pendulum as termed by M. Bouguer, upon the supposition that the increments and decrements of force, as the latitude is increased or lowered, observe the proportion which theory assigns. Only the second and the last value of $P - \Pi$ are concluded from comparisons with the pendulum at Greenwich and at London, not at the equator. The fifth column shews the value of δ corresponding to every value of $P - \Pi$, according to Clairaut's theorem:

Observers.	Places.	Lat.	$P - \Pi$	δ
Bouguer.....	Equator.....	0° 0'		
Bouguer.....	Porto Bello.....	9 34	741.8	$\frac{1}{741.8}$
Green.....	Otaheite.....	17 29	563.2	$\frac{1}{563.2}$
Bouguer.....	San Domingo.....	18 27	591.0	$\frac{1}{591.0}$
Abbé de la Caille	Cape of Good Hope	33 55	731.5	$\frac{1}{731.5}$
.....	Paris.....	48 50	585.1	$\frac{1}{585.1}$
The Academicians	Pello.....	66 48	565.9	$\frac{1}{565.9}$
Captain Phipps.....		79 50	471.2	$\frac{1}{471.2}$

"By this table it appears, that the observations in the middle parts of the globe, setting aside the single one at the Cape, are as consistent as could reasonably be expected; and they represent the ellipticity of the earth as about one 340th. But when we come within ten degrees of the equator, it should seem that the force of gravity suddenly becomes much less, and within the like distance of the poles much greater than it could be in such a spheroid." The following problem communicated by Dr. Leatherland to Dr. Pemberton, and published by Mr. Robertson, serves to find the proportion between the axis and the equatorial diameter, from measures of a degree of the meridian in two different latitudes supposing the earth an oblate spheroid. Let $APap$ (Plate LIX. fig. 15) be an ellipse representing a section of the earth through the axis Pp ; the equatorial diameter, or the greater axis of the ellipse, being Aa ; let E and F be two places, where the measure of a degree has been taken; these measures are proportional to the radii of curvature in the ellipse at those places; and if CQ , CR , be conjugates to the diameters whose vertices are E and F , CQ will be to CR in the subtriplicate ratio of the radius of curvature at E to

that at F , by cor. 1, prop. 4, part 6, of Milnes's Conic Sections, and therefore in a given ratio to one another; also the angles QCP , RCP , are the latitudes of E and F : these angles are therefore given, as well as the ratio of CQ to CR . Let QV and RS be drawn parallel to Pp , and QYW to Aa ; then from the property of the ellipse there is given the ratio of $VC^2 - ZC^2$ to $RZ^2 - QV^2$, this ratio being the same with the ratio of CA^2 to CP^2 ; therefore the ratio of CA to CP is given. Hence, if the sine and cosine of the greater latitude be each augmented in the subtriplicate ratio of the measure of the degree in the greater latitude to that in the less, then the difference of the squares of the augmented sine, and the sine of the less latitude, will be to the difference of the squares of the cosine of the less latitude, and the augmented cosine, in the duplicate ratio of the equatorial to the polar diameter. For Cq being taken in CQ equal to CR , and qu drawn parallel to QV , Cu and uq , CZ and ZR , will be the sines and cosines of the respective latitudes to the same radius; and CV , VQ , will be the augmentations of Cu and Cq in the ratio named. Hence, to find the ratio between the two axes of the earth, let E denote the greater, and F the less of the two latitudes, M and N the respective measures taken in each; and

let P denote $\sqrt{\frac{M}{N}}$: then

$$\frac{\cos^2 F - P^2 \times \cos^2 E}{P^2 \times \sin^2 E - \sin^2 F} = \frac{\text{less axis}}{\text{greater axis}}$$

It also appears from the above problem, that when one of the degrees measured is at the equator, the cosine of the latitude of the other being augmented in the subtriplicate ratio of the degrees, the tangent of the latitude will be to the tangent answering to the augmented cosine, in the ratio of the greater axis to the less. For, supposing E the place out of the equator, then, if the semi-circle $Plmnp$ be described, and IC joined, and me drawn parallel to aC : Co is the cosine of the latitude to the radius CP , and CY that cosine augmented in the ratio before named; YQ being to YI , that is, Ce to Cn or CP , as the tangent of the angle YCQ , the latitude of the point E to the tangent of the angle YCI belonging to the augmented cosine. Thus, if M represent the measure in a latitude denoted by E , and N the measure at the equator, let A denote an angle whose measure is

$$\cos. E \times \sqrt{\frac{M}{N}} \text{ Then } \frac{\tan. A}{\tan. E} = \frac{\text{less axis}}{\text{greater axis}}$$

But M , or the length of a degree, obtained by actual mensuration in different latitudes, is known from the following table:

Names.	Latit.	Value of M , toises
Maupertuis, &c.....	66 20	$M = 57438$
Cassini and } {	49 22	$M = 57074$
La Caille } {	45 00	$M = 57050$
Boscovich.....	43 00	$M = 56972$
De la Caille.....	33 18	$M = 57037$
Juan and Ulloa.....	{ at the }	$M = 56768$
Bouguer.....	{ equa- }	$M = 56753$
Condamine.....	{ tor. }	$M = 56749$

Now, by comparing the 1st with each of the following ones; the 2d with each of the following; and in like manner the 3d, 4th, and 5th, with each of the following; there will be obtained 25 results, each shewing the relation of the axes or diameters; the arithmetical means of all of which will give that ratio as 1 to 0.9951989. If the measures of the latitude of $49^\circ 22'$, and of 45° , which fall within the meridian-line drawn through France, and which have been re-examined and corrected since the northern and southern expedition, be compared with those of Maupertuis and his associates in the north, and that of Bouguer at the equator, there will result six different values of the ratio of the two axes; the arithmetical mean of all which is that of 1 to 0.9953467, which may be considered as the ratio of the greater axis to the less; which is as 230 to 228.92974, or 215 to 214, or very near the ratio as assigned by Newton. Now, the magnitude, as well as the figure of the earth, that is, the polar and equatorial diameters, may be deduced from the foregoing problems. For, as half the latus rectum of the greater axis Aa is the radius of curvature at A , it is given in magnitude from the degree measured there, and thence

thence the axes themselves are given. Thus, the circular arc whose length is equal to the radius being $57^{\circ}29'578$ degrees, if this number be multiplied by 56750 toises, the measure of a degree at the equator, as Bouguer has stated it, the product will be the radius of curvature there, or half the *latus rectum* of the greater axis; and this is to half the less axis in the ratio of the less axis to the greater, that is, as 0.9953467 to 1; whence the two axes are 6533820 and 6564366 toises, or 7913 and 7950 English miles; and the differences between the two axes about 37 miles. See Robertson's Navigation, vol. ii. p. 206, &c. Suite des Mem. de l'Acad. 1718, p. 247, and Maclaurin's Fluxions, vol. ii. book 1. chap. 14. And very nearly the same ratio is deduced from the lengths of pendulums vibrating in the same time, in different latitudes; provided it be again allowed, that the meridians are real ellipses, or the earth a true spheroid, which, however, can only take place in the case of an uniform gravity in all parts of the earth. Thus, in the new Petersburg Acts, for 1788 and 1789, are accounts and calculations of experiments relative to this subject, by M. KRAFT. These experiments were made at different times and in various parts of the Russian empire. This gentleman has collected and compared them, and drawn the proper conclusions from them: thus, he infers, that the length x of a pendulum that swings seconds in any given latitude λ , and in a temperature of 10 degrees of Reaumur's thermometer, may be determined by this equation: $x = 439.178 + 2.321 \sin^2 \lambda$, lines of a French foot, or $x = 39.0045 + 0.206 \sin^2 \lambda$, in English inches, in the temperature of 53 of Fahrenheit's thermometer. This expression nearly agrees, not only with all the experiments made on the pendulum in Russia, but also with those of Mr. Graham in England, and those of Mr. Lyons in $79^{\circ} 50'$ north latitude, where he found its length to be 431.38 lines. It also shews the augmentation of gravity from the equator to the parallel of a given latitude λ : for, putting g for the gravity under the equator, G for that under the pole, and y for that under the latitude λ , Mr. KRAFT finds $y = (1 + 0.0052848 \sin^2 \lambda) g$; and therefore $G = 1.0052848 g$. From this proportion of gravity under different latitudes, the same author infers, that, in case the earth is a homogeneous ellipsoid, its oblateness must be one 191, instead of one 230th; which ought to be the result of this hypothesis; but on the supposition, that the earth is a heterogeneous ellipsoid, he finds its oblateness, as deduced from these experiments, to be one 297th; which agrees with that resulting from the measurement of some of the degrees of the meridian. This confirms an observation of M. de la Place, that if the hypothesis of the earth's homogeneity be given up, then the theory, the measurement of degrees of latitude, and experiments with the pendulum, all agree in their result with respect to the oblateness of the earth. See Memoires de l'Acad. 1783, p. 17. In the Philos. Trans. for 1791, p. 236, Mr. DALBY has given some calculations on measured degrees of the meridian, from whence he infers, that those degrees measured in middle latitudes, will answer nearly to an ellipsoid whose axes are in the ratio assigned by Newton, viz. that of 230 to 229. And as to the deviations of some of the others, viz. towards the poles and equator, he thinks they are caused by the errors in the observed celestial arcs.

EARTH, THE MAGNETISM OF THE. The notion of the magnetism of the earth was started by Gilbert; and Boyle supposes magnetic effluvia moved from one pole to the other. Vol. i. p. 285, 290. Dr. Knight also thinks that the earth may be considered as a great loadstone, whose magnetical parts are disposed in a very strong irregular manner; and that the S. pole of the earth is analogous to the N. pole in magnets, that is, the pole by which the magnetical stream enters. He observes, that all the phenomena attending the direction of the needle, in different parts of the earth, in a great measure correspond with what happens to the needle, when placed upon a large terrella; if we make allowances for the different dispositions of the magnetical parts, with respect to each other, and consider the S. pole of the earth as a N. pole with regard to magnetism. See MAGNETISM. See also Dr. Knight's Attempt to demonstrate, that all the phenomena in nature may be explained by Attraction and Repulsion, prop. 87.

EARTH, MAGNITUDE OF THE. See GEOGRAPHY and ASTRONOMY.

EARTH, THE STRUCTURE OF. The substances of which the earth is composed, are neither disposed in a regular series, according to their specific gravities, nor yet thrown together in total disorder, as if by accident or chance. Human industry has hitherto

been able to penetrate but a very little way into the bowels of the earth, and we can but know little of its interior parts. The depth of the earth, from the surface to the centre, is nearly four thousand miles; and yet the deepest mine in Europe, that at Cotteberg, in Hungary, is not more than one thousand yards deep; "the greatest depth, therefore," says an excellent writer, "to which avarice has ever yet penetrated, may be compared to the puncture made in the body of an elephant, by the proboscis of a gnat." See GEOLOGY.

EARTHS, in chemistry, every body which possesses the following properties is so denominated. 1. Insoluble in water, or nearly so; or at least becoming insoluble when combined with carbonic acid. 2. Little or no taste or smell; especially when combined with carbonic acid. 3. Fixed, incombustible, and incapable, while pure of being altered by the fire. 4. A specific gravity not exceeding 4.9. 5. When pure, capable of assuming the form of a white powder. 6. Not altered when heated with combustibles. The earths at present known, are nine in number, namely,

- | | |
|---------------|--------------|
| 1. Barytes. | 6. Yttria. |
| 2. Strontian. | 7. Glucina. |
| 3. Lime. | 8. Zirconia. |
| 4. Magnesia. | 9. Silica. |
| 5. Alumina. | |

Which see under their respective names. Every one of the above characteristics is not, perhaps, rigorously applicable to each of these bodies; but all of them possess a sufficient number of common properties to render it useful to arrange them under one class. The discoveries which the illustrious professor, Mr. Davy, has lately made respecting the composition of the alkalies, led him to suspect that the earths are similar compounds; and from accurate experiments which he has made, it seems exceedingly probable that the earths are composed of oxygen, and a metallic base.

EARTH NUTS, or GROUND NUTS. See ARACHIS.

EARTH NUTS, or PIG NUTS. See BUNIUM.

EARTH PUCERONS. See PUCERON.

EARTHQUAKE, a sudden and violent concussion of the earth, generally accompanied with strange noises under ground, or in the air; often destroying whole cities at once, throwing down rocks, altering the course of rivers, and producing the most terrible devastations. Though there is hardly any country known, in which shocks of an earthquake have not at some time or other been felt, yet there are some much more subject to them than others. Northern countries, in general, are less subject to earthquakes than those situated near the equator, or in the southern latitudes; but this does not hold universally. The islands of Japan, which are situated pretty far north, are nevertheless exceedingly liable to these dreadful convulsions. Islands, in general, are also more subject to them than continents; but neither does this hold without exceptions. Particular parts of continents, and particular islands, are more subject to them than others lying in the neighbourhood, and differing little from them in external appearance. Portugal is more subject to earthquakes than Spain, and the latter much more than France; Mexico and Peru more than the other countries of America, and Jamaica more than the other Caribbee islands. Earthquakes are frequent, though not often violent, in Italy; but in Sicily they are often terribly destructive. Asia Minor has been remarkably subject to them from the remotest antiquity; and the city of Antioch in particular has suffered more from earthquakes than any other in that country. The same phenomena are said also to occur very frequently in the extremities of Asia, even in very high latitudes. Although no natural phenomenon is more calculated to impress the human mind with terror, and consequently to be well remembered and taken notice of, than an earthquake; yet the philosophy of them is but lately arrived at any degree of perfection; and even at this day, the history of earthquakes is very incomplete. The destruction occasioned by them engrosses the mind too much to admit of philosophical speculations at the time they happen: the same thing prevents the attentive consideration of the alterations, that take place in the atmosphere after the earthquake is over, and which might probably throw some light on the causes which produced it; and the suddenness of its coming on prevents an exact attention to those slight appearances in the earth or air, which, if carefully observed, might serve as warnings to avoid the destruction. From the observations that have been made, however, the following phenomena may be deduced, and reckoned pretty certain. 1. Where there

there are any volcanoes or burning mountains, an earthquake may reasonably be expected more frequently than in other countries. 2. If the volcano has been long quiet, a violent earthquake is to be feared, and vice versa. But to this there are many exceptions. 3. Earthquakes are generally preceded by long droughts; but they do not always come on as soon as the drought ceases. 4. They are also preceded by electrical appearances in the air; such as the *aurora borealis*, falling stars, &c.: but this does not hold universally. 5. A short time before the shock, the sea swells up and makes a great noise: fountains are troubled, and send forth muddy water; and the beasts seem frightened, as if sensible of an approaching calamity. 6. The air at the time of the shock is generally calm and serene; but afterwards commonly becomes obscure and cloudy. 7. The shock comes on with a rumbling noise, sometimes like that of carriages; sometimes a rushing noise like wind, and sometimes explosions like the firing of cannon are heard. Sometimes the ground heaves perpendicularly upwards, and sometimes rolls from side to side. Sometimes the shock begins with a perpendicular heave, after which the other kind of motion commences. A single shock is but of very short duration, the longest scarcely lasting a minute; but they frequently succeed each other at short intervals for a considerable length of time. 8. During the shock, chasms are made in the earth; from which sometimes flames, but oftener great quantities of water, are discharged. Flame and smoke are also emitted from places of the earth where no chasms can be perceived. Sometimes these chasms are but small; but, in violent earthquakes, they are often so large, that whole cities sink down into them at once. 9. The water of the ocean is affected even more than the dry land. The sea swells up to a prodigious height; much more than we could suppose it raised by the mere elevation of its bottom by the shock. Sometimes it is divided to a considerable depth; and great quantities of air, flames, and smoke, are discharged from it. The like irregular agitations happen to the waters of ponds, lakes, and even rivers. 10. The shock is felt at sea as well as on land. Ships are affected by a sudden stroke, as if they had run aground or struck upon a rock. 11. The effects of earthquakes are not confined to one particular district or country, but often extend to very distant regions; though no earthquake has yet been known extensive enough to affect the whole globe at one time. In those places also where the shock is not felt on dry land, the irregular agitation of the waters above-mentioned is perceived very remarkably. All these positions are verified by the account of those earthquakes which has been particularly described by witnesses of the best character. A terrible earthquake happened at Calabria, in 1638, which affords an exception to the second general position above laid down. In Italy, there had been an eruption of Mount Vesuvius five years before; and in Sicily there had been an eruption of *Ætna* only two years before this earthquake. The event, however, plainly shewed, that the cause of the earthquake, whatever it was, had a connection not only with Mount *Ætna*, which lies in the neighbourhood, but also with the volcano of Stromboli, which is 60 miles distant. "On the 24th of March (says Kircher) we lunched in a small boat from the harbour of Messina in Sicily, and arrived the same day at the promontory of Pelorus. Our destination was for the city of Euphemia in Calabria; but on account of the weather, we were obliged to continue three days at Pelorus. At length, wearied with the delay, we resolved to prosecute our voyage; and although the sea seemed more than usually agitated, yet we ventured forward. The gulph of Charybdis, which we approached, seemed whirled round in such a manner as to form a vast hollow, verging to a point in the centre. Proceeding onward, and turning my eyes to Mount *Ætna*, I saw it cast forth large volumes of smoke, of mountainous size, which entirely covered the island, and blotted out even the shores from my view. This, together with the dreadful noise, and the sulphureous stench, which was strongly perceived, filled me with apprehensions that some more dreadful calamity was impending. The sea itself seemed to wear a very unusual appearance; those who have seen a lake in a violent shower of rain all covered over with bubbles, will have some idea of its agitations. My surprise was still increased by the calmness and serenity of the weather; not a breeze, not a cloud, which might be supposed to put all nature thus into motion. I therefore warned my companions, that an earthquake was approaching; and, after some time, making for the shore with all possible diligence, we landed at Tropæa. But we had scarce arrived at

the Jesuits college in that city, when our ears were stunned with a horrid sound, resembling that of an infinite number of chariots driven fiercely forward, the wheels rattling and the thongs cracking. Soon after this, a most dreadful earthquake ensued; so that the whole track upon which we stood seemed to vibrate, as if we were in the scale of a balance that continued waving. This motion, however, soon grew more violent; and being no longer able to keep my legs, I was thrown prostrate upon the ground. After some time, finding that I remained unhurt amidst the general concussion, I resolved to venture for safety; and running as fast as I could, reached the shore. I did not search long here, till I found the boat in which I had landed, and my companions also. Leaving this seat of desolation, we prosecuted our voyage along the coast; and the next day came to Rochetta, where we landed, although the earth still continued in violent agitations. But we were scarce arrived at our inn, when we were once more obliged to return to our boat; and in about half an hour we saw the greatest part of the town, and the inn in which we had set up, dashed to the ground, and burying all its inhabitants beneath its ruins. Proceeding onward in our little vessel, we at length landed at Lopicium, a castle midway between Tropæa and Euphemia, the city to which we were bound. Here, wherever I turned my eyes, nothing but scenes of ruin and horror appeared; towns and castles levelled to the ground; Stromboli, though at 60 miles distance, belching forth flames in an unusual manner, and with a noise which I could distinctly hear. But my attention was quickly turned from more remote to contiguous danger. The rumbling sound of an approaching earthquake, which by this time we were grown acquainted with, alarmed us for the consequences. It every moment seemed to grow louder, and to approach more near. The place on which we stood began to shake most dreadfully; so that, being unable to stand, my companions and I caught hold of whatever shrub grew next us, and supported ourselves in that manner. After some time, the violent paroxysm ceasing, we again stood up, in order to prosecute our voyage to Euphemia, which lay within sight. In the mean time, while we were preparing for this purpose, I turned my eyes toward the city; but could see only a frightfully dark cloud, that seemed to rest upon the place. This the more surprised us, as the weather was so very serene. We waited, therefore, till the cloud was passed; then turning to look for the city, it was totally sunk; and nothing but a dismal and putrid lake was to be seen where it stood." In 1693 an earthquake happened in Sicily, which may justly be accounted one of the most terrible, of which we have any account. It shook the whole island; and even Naples, and Malta shared in the shock. It was impossible for any body in this country to keep on their legs on the tottering earth; nay, those that lay on the ground were tossed from side to side as on a rilling billow: high walls leaped from their foundations several paces, &c. The mischief it did is amazing; almost all the buildings in the countries were thrown down; 54 cities and towns, besides an incredible number of villages, were either destroyed or greatly damaged. Catania, one of the most famous, ancient, and flourishing cities in the kingdom, had the greatest share in the tragedy. Anthony Serrovita, being on his way thither, at the distance of a few miles, observed a black cloud like night hovering over the city; when there arose from the mouth of Mont Gibello great spires of flame, which spread all around. The sea all of a sudden began to roar and rise in billows; and there was a blow, as if all the artillery in the world had been at once discharged. The birds flew about, the cattle ran crying, and the horses stopped short, trembling; so that he and his companions were forced to alight. They were no sooner off, but they were lifted from the ground above two palms; when looking towards Catania, he with amazement saw nothing but a thick cloud of dust in the air. Of that magnificent city, there was not the least footstep to be seen. S. Bonajutus assures us, that of 18,900 inhabitants, 18,000 perished therein. The great earthquake, however, which happened on the 1st of Nov. 1755, affords the clearest example of all the phenomena above-mentioned, having been felt violently in many places both on land and at sea, and extended its effects to the waters in many other places where the shock was not perceived. At Lisbon in Portugal its effects were most severe. In 1750, there had been a sensible trembling of the earth felt in this city: for four years afterwards, there had been an excessive drought; insomuch that some springs, formerly very plentiful of water, were dried, and totally lost. The predominant winds

winds were N. and N. E. accompanied with various, though very small, tremors of the earth. The year 1755 proved very wet and rainy: the summer cooler than usual; and for 40 days before the earthquake, the weather was clear, but not remarkably so. The 31st of October, the sun was obscured, with a remarkable gloominess in the atmosphere. On the 1st of Nov. early in the morning, a thick fog arose, which was soon dissipated by the heat of the sun; no wind was stirring; the sea was calm; and the weather was as warm as in June or July in Britain. At 35 minutes after 9, without the least warning, except a rumbling noise, like the artificial thunder in our theatres, a most dreadful earthquake shook, by quick but short vibrations, the foundations of all the city, so that many buildings instantly fell. Then, with a pause scarce perceptible, the nature of the motion was changed, and the houses were tossed from side to side, with a motion like that of a waggon violently driven over rough stones. This second shock laid almost the whole city in ruins, with a prodigious slaughter of the people. The earthquake lasted in all about six minutes. At the moment of its beginning, some persons on the river, near a mile from the city, heard their boat make a noise as if it had run aground, though they were then in deep water; and at the same time they saw the houses falling on both sides of the river. The bed of the river Tagus was in many places raised to its surface. Ships were driven from their anchors, and jostled together with great violence; nor did their masters know whether they were afloat or aground. A large new quay sunk to an unfathomable depth, with several hundreds of people upon it; nor was one of the dead ever found. The bar was at first seen dry from shore to shore: but suddenly the sea came rolling in like a mountain; and about Belem Castle the water rose fifty feet almost in an instant. About noon there was another shock; when the walls of several houses that yet remained opened from top to bottom more than a quarter of a yard, and afterwards closed again so exactly that scarce any mark of the injury was left. The number of people who perished in this dreadful catastrophe is said, according to the lowest calculation, to amount to more than sixty thousand; and though the damage in other respects cannot be computed, yet some idea may be formed of it, when we consider, that this extensive and opulent city was so reduced as to present nothing but a vast heap of ruins; that the rich and poor were put upon a level; some thousands of families which, the day before had been easy in their circumstances, were now scattered about in the fields, wanting every convenience of life, and finding none able to relieve them. This was not the only place at which the shock was experienced. This earthquake was very general. St. Ube's, a sea-port near Lisbon, was entirely swallowed up, by the repeated shocks and the vast surf of the sea. The same earthquake was felt over all Spain, except in Catalonia, Arragon, and Valencia. In many places the sea was agitated in an unusual manner rising six feet every fifteen minutes, and then falling so as sometimes to leave the bottom dry. The earthquake was felt almost as severely in Africa as it had been in Europe. Great part of Algiers was destroyed. At Arzila (a town in Fez), 10 A.M. the sea suddenly rose with such impetuosity, that it lifted up a vessel in the bay, and dropped it with such force on the land, that it was broke to pieces; and a boat was found two musket shot within land from the sea. At Fez and Mequinez, great numbers of houses fell, and multitudes of people were buried in the ruins. At Morocco, by the falling of houses many people lost their lives: and about eight leagues from the city the earth opened and swallowed up a village with all the inhabitants, who were known by the name of the Sons of Besumba, to the number of about eight or ten thousand persons, together with all their cattle, &c. and soon after the earth closed again in the same manner as before. In the city of Funchal, in the island of Madeira, a shock of this earthquake was first perceived at 38 minutes past 9 A. M. It commenced with a rumbling noise in the air, like that of empty carriages passing hastily over a stone pavement. The observers felt the floor immediately after move with a tremulous motion, vibrating very quickly. The shock continued more than a minute; during which space, the vibrations, though continual, were weakened and increased in force twice very sensibly. The increase after the first remission of the shock was the most intense. The noise in the air accompanied the shock during the whole of its continuance, and lasted some seconds after the motion of the earth had ceased; dying away like a peal of distant thunder rolling through the air. At three quarters past eleven, the sea, which was quite calm, it being a fine

day, and no wind stirring, retired suddenly some paces; then rising with a great swell without the least noise, and as suddenly advancing overflowed the shore, and entered the city. It rose 15 feet perpendicular above the high water mark, although the tide, which flows there 7 feet, was then at half ebb. Such were the phenomena with which this remarkable earthquake was attended in those places where it was violent. The effects of it, however, reached to an immense distance; and were perceived chiefly by the agitations of the waters, or some slight motion of the earth. The utmost boundaries of this earthquake to the south are unknown; the barbarity of the African nations rendering it impossible to procure any intelligence from them, except where the effects were dreadful. On the north, however, we are assured that it reached as far as Norway and Sweden. In the former, the waters of several rivers and lakes were violently agitated. In the latter, shocks were felt in several provinces, and all the rivers and lakes were strongly agitated, especially in Dalecarlia. The river Dala suddenly overflowed its banks, and as suddenly retired. At the same time a lake three miles distant, which had no communication with it, bubbled up with great violence. At Fahlum, a town in Dalecarlia, several strong shocks were felt. Shocks of this great earthquake were felt in several places of France; particularly at Bayonne, Bourdeaux, and Lyons: and commotions of the waters were observed at Angoulesme, Bleville, Havre de Grace, &c. In many places of Germany its effects were very perceptible. Throughout the duchy of Holstein, the waters were violently agitated, particularly those of the Elbe and Trave. In Brandenburg, the water of a lake, called Libsec, ebbed and flowed six times in half an hour, with a dreadful noise, the weather being then perfectly calm. The same agitation was observed in the waters of the lakes called Muplgast and Netzo; but at this last place they also emitted an intolerable stench. In Holland the agitations were more remarkable. At Amsterdam, about 11 A. M. the air being perfectly calm, the waters were suddenly agitated in their canals, so that several boats broke loose; chandeliers were observed to vibrate in the churches; but no motion of the earth, or concussion of any building, was observed. At Haerlem, in the forenoon, for near four minutes together, not only the water in the rivers, canals, &c. but also all kinds of fluids in smaller quantities, as in coolers, tubs, backs, &c. were surprisingly agitated, and dashed over the sides, though no motion was perceptible in the vessels themselves. Round the island of Corsica, the sea was violently agitated, and most of the rivers of the island overflowed their banks. In the city of Milan, and throughout the Milanese, shocks were felt. At Turin there was felt a very violent shock. In Switzerland, many rivers turned suddenly muddy without rain. The lake of Neufchatel swelled near two feet above its natural level for a few hours. An agitation was also perceived in the water of the lake of Zurich. At the island of Antigua, there was such a sea without the bar as had not been known in the memory of man; and after it, all the water at the wharfs, which used to be six feet deep, was not two inches. At Barbadoes, about 2 P.M. the sea ebbed and flowed in a surprising manner; ran over the wharfs and streets into the houses, and continued thus ebbing and flowing till ten at night. The agitation of the waters was perceived in great numbers of places in Great Britain. At Barlborough in Derbyshire, between 11 and 12 A. M. in a boat-house on the W. side of a large body of water called Pibley dam, was heard a surprising and terrible noise; a large swell of water came in a current from the S. and rose two feet on the sloped damhead at the N. end of the water. It then subsided; but returned immediately, though with less violence. The water was thus agitated for three quarters of an hour; growing gradually weaker and weaker every time, till it entirely ceased. At Bushbridge in Surrey, at half an hour after ten in the morning, the weather being remarkably still, without the least wind, in a canal near 700 feet long, and 58 feet broad, with a small spring constantly running through it, a very unusual noise was heard at the E. end, and the water there observed to be in great agitation. It rose in a heap in the middle, between two and three feet above its usual level, and extending lengthways about 30 yards. After this, the heap vibrated towards the N. side of the canal with great force, and flowed above eight feet over the grass walk on that side. On its return back into the canal, it again rose in the middle, and then heeled with yet greater force to the south side, and flowed over its grass walk. During this latter motion, the bottom on the north side was left dry for several feet.

This appearance lasted for about a quarter of an hour, after which the water became smooth and quiet as before. During the whole time, the sand at the bottom was thrown up and mixed with water; and there was a continual noise like that of water turning a mill. At Cobham, in Surrey, between ten and eleven o'clock, while a man was watering a horse at a pond fed by springs, the water suddenly ran away from him, and moved toward the south, with such swiftness, that the bottom of the pond was left bare. It returned again with such impetuosity, that the man leaped backwards to secure himself from its sudden approach. The ducks were alarmed at the first agitation, and instantly flew all out of the pond. At Dunstall, in Suffolk, the water of a pond rose gradually for several minutes in the form of a pyramid, and fell down like a water-spout. Other ponds in the neighbourhood had a smooth flux and reflux from one end to the other, and in several other parts of the kingdom effects equally surprising were observed. At Loch Lomond, in Scotland, about half an hour after 9 A. M. all of a sudden, without the least gust of wind, the water rose against its banks with great rapidity, but immediately subsided, till it was as low as any person then present had ever seen it in the greatest summer drought. Instantly it returned towards the sides, and in five minutes rose again as high as before. The agitation continued at the same rate till 15 minutes after 10 A. M. taking 5 minutes to rise, and as many to subside. From 15 minutes after 10 till 11 the height of every rise came somewhat short of that immediately preceding, still taking 5 minutes to flow, and as many to ebb, till the water was entirely settled. The greatest perpendicular height of this swell was two feet four inches. A still more remarkable phenomenon attending the earthquake in this lake was, that a large stone lying at some distance from shore, but in such shallow water that it could easily be seen, was forced out of its place in the lake upon dry land, leaving a deep furrow in the ground all along the way in which it had moved. In Loch-Ness, about half an hour after nine, a very great agitation was observed in the water. At Kinsale, in Ireland, between 2 and 5 P. M. the weather being very calm, and the tide near full, a large body of water poured suddenly into the harbour with such rapidity, that it broke the cables of two sloops, each moored with two anchors, and of several boats lying near the town. But just at the time that a great deal of mischief was apprehended by all the vessels running foul of each other, an eddy whirled them round several times, and then hurried them back again with the same rapidity as before. This was several times repeated; and while the current rushed up at one side of the harbour, it poured down with equal violence at the other. A vessel that lay all this time in the pool did not seem to be any ways affected by it; nor was the violence of the currents much perceived in the deeper parts of the harbour, but raged with most violence on the flats. From different accounts it appeared that the water was affected in a similar manner all along the coast of Ireland, west of Kinsale. These are the most striking phenomena with which the earthquake of Nov. 1, 1755, was attended on the surface of the earth. Those which happened below ground cannot be known but by the changes observed in springs, &c. which were in many places very remarkable. At Colares, on the afternoon of the 31st Oct. the water of a fountain was greatly decreased: on the morning of the 1st of Nov. it ran very muddy; and, after the earthquake, returned to its usual state both as to quantity and clearness. On the hills numbers of rocks were split; and there were several rents in the ground, but none considerable. In some places where formerly there had been no water, springs burst forth, which continued to run. Some of the largest mountains in Portugal were impetuously shaken as it were from their foundation; most of them opened at their summits, split and rent in a wonderful manner, and huge masses of them were thrown down into the subjacent valleys. From the rock Alvidar, near the hill Fojo, a kind of parapet was broken off, which was thrown up from its foundation in the sea. At Varge, on the river Macaas, during the earthquake, many springs of water burst forth, some spouted up, eighteen or twenty feet, throwing up sand of various colours, which remained on the ground. A mountainous point, seven or eight leagues from St. Ube's, cleft asunder, and threw off several vast masses of rock. In Barbary, a large hill was rent in two; the two halves fell different ways, and buried two large towns. A remarkable change was observed on the medicinal waters of Troplitz, a village in Bohemia famous for its baths. These waters were discovered in 1762;

from which time the principal spring of them had constantly thrown out hot water in the same quantity, and of the same quality. On the morning of the earthquake, between 11 and 12 A. M. the principal spring cast forth such a quantity of water, that in half an hour all the baths ran over. About half an hour before this, the spring had flowed turbid and muddy; then having stopped entirely for a minute, it broke forth again with prodigious violence, driving before it a considerable quantity of reddish ochre. After this it became clear, and flowed as pure as before. It still continues to do so; but the water is in greater quantity, and hotter, than before the earthquake. At Angoulesme in France, a subterraneous noise like thunder was heard; and presently after the earth opened, and discharged a torrent of water mixed with red sand. Most of the springs in the neighbourhood sunk in such a manner, that for some time they were thought to be quite dry. In Britain, no considerable alteration was observed in the earth, except that, near the lead mine in Derbyshire, a cleft was observed about a foot deep, six inches wide, and 150 yards in length. The earthquakes, which in 1783 ruined a great part of Italy and Sicily, though much more confined in their extent, than that of 1755, seem to have been not at all inferior in violence. Sir William Hamilton, who wrote a particular account of their effects, informs us, that "if, on a map of Italy, and with your compass on the scale of Italian miles you measure off 22, and then fixing the central point in the city of Oppido, form a circle (the radii of which will be 22 miles, you will include all the towns, villages, &c. that have been utterly ruined, and the spots where the greatest mortality happened, and where there have been the most visible alterations on the face of the earth: then extend your compass on the same scale to 72 miles, preserving the same centre, and form another circle, you will include the whole country that has any mark of having been affected by the earthquake." A circumstance was remarked, in which this earthquake differed from others, viz. that of two towns situated at an equal distance from this centre, one on the hill, the other on the plain or in a bottom, the latter always suffered most. From the most authentic accounts received by the king of Sicily's secretary of state, it appeared that the part of Calabria which had been most affected by this calamity, was comprehended between 38° and 39° of lat. N. that the greatest force of the earthquake had been exerted from the foot of those mountains of the Apennines called Dijo, Sacro, and Caulene, extending W. to the Tyrrhene sea; that the towns, villages, and farm-houses, nearest these mountains, situated either on the hills or the plain, were totally ruined by the shock of the 5th Feb. about noon: that even the more distant towns had been greatly damaged by the subsequent shocks of the earthquakes, and effectually by those of the 7th, 26th, and 28th of Feb. and that of the 1st of March; that from the first shock of the 5th of Feb. the earth had been in a continual tremor; and that the motion of the earth had been either whirling like a vortex, horizontal, or by pulsations, or by beatings from the bottom upwards. This variety of motions increased the apprehensions of the miserable inhabitants, who expected every moment that the earth would open under their feet, and swallow them up. These phenomena had been attended with irregular and furious gusts of wind; and from all these causes, the face of that part of Calabria, comprehended between the 38° and 39° was entirely altered. The number of lives lost was estimated at 32,367; but Sir William Hamilton is of opinion, that, including strangers, it could not be less than 40,000. The fate of the inhabitants of Scilla was extremely affecting. On the first shock of the earthquake, Feb. 5th, they had fled along with their prince to the sea-shore, where they hoped for safety; but in the night a furious wave overflowed the land for three miles, sweeping off in its return the prince and 2473 of the inhabitants, who were at that time either on the strand, or in boats near the shore. Various theories have been invented to explain the phenomena of earthquakes. Till lately, the hypotheses of modern philosophers were much the same with those of the ancients. Anaxagoras supposed the cause of earthquakes to be subterraneous clouds bursting out into lightning, which shook the vaults that confined them. Others imagined, that the arches, which had been weakened by continual subterraneous fires, at length fell in. Others derived these double convulsions from the rarefied steam of waters, heated by some neighbouring fires, (a hypothesis lately revived by M. Dolomieu,) and some, among whom was Epicurus, and several of the Peripatetics, ascribed them to the ignition of certain inflammable

ble exhalations. This last hypothesis has been adopted by many of the most celebrated moderns, as Gassendus, Kircher, Schottus, Varenus, Des Cartes, Du Hamel, Honorius, Fabri, &c. The philosopher last mentioned, indeed supposed, that waters prodigiously rarefied by heat, might sometimes occasion earthquakes. The others supposed, that there are many and vast cavities under ground, which have a communication with one another: some of which abound with waters; others with vapours and exhalations, arising from inflammable substances, as nitre, bitumen, sulphur, &c. These combustible exhalations they supposed to be kindled by a subterraneous spark, or by some active flame gliding through a narrow fissure from without, or by the fermentation of some mixture; and when this happens, that they may necessarily produce pulses, tremors, and ruptures at the surface, according to the number and diversity of the cavities, and the quantity and activity of the inflammable matter. This hypothesis they illustrated by a variety of experiments, such as mixtures of iron filings and brimstone buried in the earth, gun-powder confined in pits, &c. by all which a shaking of the earth will be produced. Dr. Woodward suggests another hypothesis. He supposes that the subterraneous heat or fire, which is continually elevating water out of the abyss, which, according to him, occupies the centre of the earth, to furnish rain, dew, springs, and rivers, may be stopped in some particular part. When this obstruction happens, the heat causes a great swelling and commotion in the waters of the abyss; and at the same time, making the like effort against the superincumbent earth, that agitation and concussion of it is occasioned, which we call an earthquake. M. Amontons suggests a hypothesis entirely different from all these. According to the philosophical principles, which suppose the atmosphere to be about 45 miles high, and that the density of the air increases in proportion to the absolute height of the superincumbent column of fluid; it is shewn, that at the depth of 43,528 fathoms below the surface of the earth, air is but one-fourth lighter than mercury. Now, this depth of 43,528 fathoms is only a 74th part of the semi-diameter of the earth; and the vast sphere beyond this depth, in diameter 6,451,538 fathoms, may probably be only filled with air; which will be here greatly condensed, and much heavier than the heaviest bodies we know in nature. But it is found by experiment, that the more air is compressed, the more does the same degree of heat increase its spring, and the more capable does it render it of a violent effect; and that, for instance, the degree of heat of boiling water increases the spring of the air above what it has in its natural state, in our climate, by a quantity equal to a third of the weight wherewith it is pressed. Whence we may conclude, that a degree of heat, which on the surface of the earth will only have a moderate effect, may be capable of a very violent one below. And, as we are certain, that there are in nature, degrees of heat much greater than that of boiling water, it is possible there may be some, whose violence, further increased by the immense weight of the air, may be sufficient to break and overturn this solid orb of 43,528 fathoms; whose weight, compared to that of the included air, would be but a trifle. Though none of these hypotheses were sufficient for explaining the phenomena of earthquakes in a satisfactory manner, one or other of them continued to be adopted by almost all philosophers till 1749. In March 1749, an earthquake was felt at London and several other places in Britain. Dr. Stukely, who had been much engaged in electrical experiments, began to suspect, that phenomena of this kind ought to be attributed not to vapours or fermentations generated in the bowels of the earth, but to electricity. In a paper published by him on this subject, he rejects all the above hypotheses for the following reasons:—1. That there is no evidence of any remarkable cavernous structure of the earth; but that, on the contrary, there is reason to presume, that it is in a great measure solid, so as to leave little room for internal changes and fermentations within its substance; nor do coal-pits, when on fire, ever produce any thing resembling an earthquake. 2. In the earthquake at London, in March 1749, there was no such thing as fire, vapour, smoke, smell, or an eruption of any kind observed, though the shock affected a circuit of 30 miles in diameter. This consideration alone of the extent of surface shaken by an earthquake, he thought sufficient to overthrow the supposition of its being owing to the expansion of any subterraneous vapours. For, as small fire balls bursting in the air propagate a sulphureous smell to the distance of several miles, it cannot be supposed, that so im-

mense a force, acting instantaneously, on that compass of ground, should never break the surface of it, nor become discoverable either to the sight or the smell, besides that such fermentation would require a long time. That such an effect, therefore, should be produced instantaneously, can be accounted for by electricity only, which acknowledges no sensible transition of time, nor any bounds. 3. If vapours and subterraneous fermentations, explosions, and eruptions, were the cause of earthquakes, they would absolutely ruin the whole system of springs and fountains, wherever they had once been: which is contrary to fact; even when they have been frequently repeated. In the earthquake in Asia Minor, A. D. 17, which destroyed 13 great cities, and shook a mass of earth 300 miles in diameter, nothing suffered but the cities; neither the springs nor the face of the country being injured. 4. That any subterraneous power, sufficient to move 30 miles in diameter, must be lodged at least 15 or 20 miles below the surface; and therefore must move an inverted cone of solid earth, the base of which is 30 miles in diameter, and the axis 15 or 20; an effect impossible to any natural power whatever, except electricity. So in Asia Minor, such a cone must have been 300 miles in the diameter of the base, and 200 in the axis; which not all the gunpowder that has been made since the invention of it, much less any vapours generated so far below the surface, could possibly effect. 3. A subterraneous explosion will not account for the manner in which ships, far from land, and even fish, are affected during an earthquake. A subterraneous explosion would only produce a gradual swell, and not give so quick an impulse to the water as would make it feel like a stone. From these circumstances the Doctor concluded, that an earthquake was a shock of the same kind as those in electrical experiments. And this hypothesis was confirmed by the phenomena attending earthquakes; particularly those of 1749 and 1750, which gave rise to his publication. From these phenomena, he inferred, that if a non-electric cloud discharge its contents upon any part of the earth, in a highly electrical state, an earthquake must necessarily ensue. As the discharge from an excited tube produces a commotion in the human body, so the discharge of electric matter from many miles of solid earth must needs be an earthquake; and the snap from the contact, the horrid uncouth noise attending it. Dr. Stukely does not attempt to account for the manner in which the earth and air are put into a state of electricity proper for this purpose. The same hypothesis was advanced by Signior Beccaria, without knowing any thing of Dr. Stukely's discoveries. But this learned Italian imagined the electric matter to be lodged deep in the bowels of the earth, agreeably to his hypothesis concerning lightning. Now, as the quantity of electric matter in the simplest thunder-storms is so inconceivably great, that it is impossible to be contained by any cloud or number of clouds; and as, during the progress of a thunder-storm which he observed, though the lightning frequently struck to the earth, the same clouds were the next moment ready to make a still greater discharge; it was evident, that they must have received at one place, the moment a discharge was made from them in another. Let us suppose these clouds ever so great, if the lightning proceeded only from them, the quantity must be lessened by every discharge; and no recruits, that any new clouds might bring, can bear any proportion to the discharge which must ensue, from the collision of so great a number as combine to form a thunder-storm. It seems therefore most likely, that the electric matter is continually darting from the clouds in one place, while it is discharged from the earth in another; and, consequently, that the clouds serve as conductors of the electric fluid from those places of the earth which are overloaded with it, to those which are exhausted. This theory being admitted, he thinks earthquakes may be ascribed to the same cause. For if the equilibrium of the electric matter be lost in the bowels of the earth; so that the best method of restoring it shall be by the fluid bursting into the air, and traversing several miles of the atmosphere, to come at the place where it is wanted; it may be easily imagined, that violent concussions will be given to the earth by the sudden passage of so powerful an agent. This, he says, was confirmed by the flashes of light, resembling lightning, which have been frequently seen to rush from the top of Mount Vesuvius, when ashes, &c. have been carried out of it into the air, and scattered over a large tract of country. And it is well known that volcanoes have a near connection with earthquakes. Dr. Priestley, in his History of Electricity, observes upon these theories, that a

more probable hypothesis may be formed out of them both. "Suppose (says he) the electric matter to be accumulated in one part of the surface of the earth, and on account of the dryness of the season cannot easily diffuse itself; it may force its way into the higher regions of the air, forming clouds in its passage out of the vapours which float in the atmosphere, and occasion a sudden shower, which may further promote the passage of the fluid. The whole surface, thus unloaded, will receive a concussion, like any other conducting substance, on parting with, or receiving a quantity of the electric fluid. The rushing noise will likewise sweep over the whole extent of the country. And upon this supposition also the fluid in its discharge from the country, will naturally follow the course of the rivers, and also take the advantage of any eminences to facilitate its ascent into the higher regions of the air." The three last hypotheses, though somewhat differing, yet agree in the main; but if a particular solution of the phenomena is required, every one of them will be found deficient. The editors of the *Encyclopædia Britannica*, urge the following objections to them, and offer a much more plausible theory, a part of which we shall here quote. "If, according to Dr. Stukely's hypothesis, the electric matter is lodged only on the surface of the earth, or but a small depth below, how are we to account for those violent effects which often take place in the bowels of the earth? In the earthquake at Lisbon, a large quay sunk to any unfathomable depth. We are certain that the cause of the earthquake must have been below this depth, however great it was, and have opened the earth for an immense way downwards. At the same time a hill in Barbary clave asunder, and the two halves of it fell different ways. This shews, that the cause of the earthquake operated not on the surface of the hill, but on the solid foundation and contents of it; nor can it be explained by any superficial action whatever. From what the miners at Eyam bridge in Derbyshire observed, it is also evident, that the shock was felt at the depth of 396 feet below the surface of the ground, more than at the surface itself; and consequently there is all the reason in the world to think, that the cause lay at a depth vastly greater. Again, though the earthquake at London was supposed to begin with a black cloud and shower; yet in that of 1755, the effects of which were incomparably greater, the air was calm and serene almost in every place where it was felt. It does not appear, that there is at any time a considerable difference between the electricity of the atmosphere and that of the earth, or indeed that there can be so. For if the earth is electrified plus, and the atmosphere minus, there are innumerable points on the surface of the earth, which must be imperceptibly drawing off the superfluous electric matter into the air. The vapours also, with which the atmosphere abounds, would always be ready in the same service: and thus thunder and lightning might indeed sometimes be produced, but not earthquakes. But lastly neither the air nor the earth do always shew any remarkable signs of electricity before earthquakes happen. For, the summer before the earthquake at Manchester in 1777, there had scarce been any thunder, lightning, or other signs of electricity in the atmosphere, and vegetation had been extremely backward; and, according to the best accounts, the weather continued remarkably fine. For these reasons, Dr. Stukely's hypothesis seems not to be satisfactory. That of Signior Beccaria is not indeed liable to the above-mentioned objections; but seems highly improbable on another account. The atmosphere is known to be a substance through which the electric matter makes its way with the utmost difficulty. It is a vastly worse conductor than water or than moist earth. If therefore the equilibrium of this fluid is lost in the bowels of the earth, it is impossible to give a reason, why it should not rather go to the places where it is wanted through the earth itself, than through the atmosphere. Besides, if this were the case, the shock of an earthquake could only be felt at those places where the electric fluid issued from the earth, and where it entered. All the intermediate places, ought to be free from any shock, and to be sensible only of a violent concussion in the atmosphere; but of this we have no example in any history of earthquakes whatever. Dr. Priestley's hypothesis is liable to the same objections with that of Dr. Stukely; for any superficial operation will never account for those effects above-mentioned, which take place at great depths below the surface. His experiment cannot be admitted as any way conclusive with regard to the cause of earthquakes, because no quantity of electric fire is seen to pass over the earth and sea, like the flash attending the explosion of an electric battery; and the force of his

earthquake (being but just able to throw down a stick that could hardly stand by itself) seems by far too little. To give an explanation of the phenomena of earthquakes, which shall be free from the objections above-mentioned, and from all others, it will be necessary in the first place, to consider those parts of the system of nature, which seem to be most affected during the terrible phenomena we treat of. These are, the air, the solid earth, and the water. Of these the two former are electrics per se; the latter is a conductor, though a bad one. (See *ELECTRICITY*.) Hence it follows, 1. That in proportion to the quantity of earth which is mixed with any quantity of water, that mixture will approach nearer to the nature of an electric per se, and vice versa. 2. That whatever quantity of electricity is communicated to the solid earth, will be quickly taken off from it by the water which is mixed with it, in the same manner that the electric matter is carried off from an excited globe by a metallic conductor. 3. The whole earth is moist, and therefore in some degree a conductor. Nevertheless, as earth of all kinds, when perfectly dry, is found to be an electric capable of receiving a charge like glass, it is therefore possible, that the electric power of the earth may be excited to such a degree, that the moisture of the solid parts cannot easily contain the quantity of electricity communicated. 4. In this case, the earth must either give undoubted signs of its being excited in the same manner that other excited electrics are, or the electricity must be discharged somewhere else. 5. To receive any superfluous quantity of electric matter, that may be communicated to the solid earth, the waters of the ocean are always ready. These, being a much better conductor than earth, must be a principal mean of preserving the equilibrium of electricity in the different parts of the earth; and hence we see a natural reason why the waters of the ocean should cover so large a proportion of the globe, as they are known to do. See *OCEAN*. 6. Fire is also a conductor of electricity. Therefore, wherever a quantity of electric matter is collected in any part of the solid earth, if it can neither be conveniently received by the moisture which the earth naturally contains, nor by the ocean in its neighbourhood, it will discharge itself by any volcano that happens to be in an active state near the place where that collection of electric matter is. 7. The electric fluid being violently resisted by the superincumbent atmosphere, has always a tendency to discharge itself in those places where that resistance is least. The tops of high mountains, therefore, where the weight of the atmosphere is greatly diminished, will also afford a ready passage for the electric fluid, when it is collected in very great quantity in the bowels of the earth. 8. If, from some natural causes, the electric matter shall happen to be collected in the bowels of the earth in any particular place, and at the same time such obstacles are thrown in its way, that it can neither discharge itself into the ocean, nor into the atmosphere by the tops of high mountains, nor by the more open passages of volcanoes; the most terrible consequences must ensue: the matter being pent up, and the cause by which it is collected continuing still to act, its impulse becomes at last irresistible. It then flies against every obstacle with inconceivable violence. It breaks out in all those places where there is the least resistance, and therefore the shock is directed a great number of different ways at once. Houses, steeples, trees, &c. by their height take off somewhat of the pressure of the atmosphere; and therefore the electric matter flies against them very violently. The houses and other buildings being bad conductors, are thrown down; the trees affording a readier passage to the fluid are not hurt, though even they also are sometimes split. The height of the mountains renders them the objects of the destructive force of this fluid much more than any buildings whatever. Hence they are often rent, and rocks thrown from them. The water contained in the solid parts of the earth, being a conductor of electricity, becomes overloaded with it; and when it can receive no more, is forced to yield to the impulse of the rest, and therefore is thrown out of the earth in great quantities. For the same reason, the waters on the surface of the earth are most violently agitated. The small quantities contained in wells are thrown out at the tops of them: the rivers and lakes, which contain too great a quantity of water to be thrown off from the earth, rise in billows: the ocean itself, receiving more electric matter than can be immediately dispersed through the whole body of water, or evaporated into the atmosphere, retreats from the land, and is raised in vast mountains. The solid earth being unable either to conduct the fluid quietly to those parts where it is wanted, or to

retain it, is violently shaken or rent in multitudes of places; and this not only on the surface, but to great depths. The electricity being now in some measure discharged from the earth, the ocean rushes forward with fury to discharge in its turn the excess of electric matter it just before received from the earth. If there are volcanoes in the neighbourhood, the violent discharge of electricity manifests itself by setting them in a flame; and thus, till the equilibrium is restored all nature seems to be threatened with dissolution.—Even in those places where the force of the electric fluid is not able to shake the solid parts of the earth, it manifests its power by agitating the waters in the manner above described. Water being a much better conductor of electricity than earth, this subtle fluid, as soon as it can get out from the solid earth, flies to the water. The consequence is, that the water immediately swells up, and is attracted by whatever part of the earth has less electricity than itself. Hence those strange irregular motions of the waters in different places, so particularly observed at the time of the earthquake at Lisbon; and which it seems impossible to account for from any other cause than an immediate discharge of electric matter from the earth into them. 9. As it is impossible that any part of the earth can be electrified, without communicating a proportionable share of electricity to the animals that live upon it, it thence follows, that there can be no considerable commotion in the electric matter lodged in the bowels of the earth, without affecting that which is contained in the bodies of the animals. Hence the brutes, who seem to be more sensible of such commotions than we, run about, and shew signs of fear, before the earthquake comes on; and hence the giddiness, sickness, &c. which the human race are subject to, during the time of the shock, even though they do not feel it, as was the case at Gibraltar. 10. As the atmosphere hath a communication with the earth, it is scarcely to be supposed that the earth can, for any length of time, contain a considerable quantity of electric matter, without communicating to the atmosphere a proportionable quantity. Before an earthquake, therefore, we must suppose the electricity of the earth and air to be in perfect equilibrium. Hence the weather is serene, there is no wind, nor any other sign in the atmosphere, of the terrible catastrophe that is about to ensue. But the moment the discharge is made from the earth, the equilibrium between terrestrial and atmospheric electricity is broken; the air either begins to receive the fluid from the earth, or the earth from the air. As there is not then time for the collection of thunder clouds by which the electricity may be brought down in sudden flashes of lightning, the fluid breaks through the substance of the air itself with dismal and horrid noises, which always accompany an earthquake. That this is the case, seems highly probable from an experiment of M. de Romas, when, having brought down a vast quantity of electric matter from the clouds by means of a kite, he heard the noise it made in the air, like the continual blowing of a small forge bellows. In general, a considerable change of weather takes place at the time of an earthquake, though not always. In the earthquake which happened in England in 1777, there was no remarkable change of weather there; but, soon after, there was a great deal of thunder and lightning in the southern parts of Scotland: which seems to indicate, that the electric fluid discharged from the earth in England had taken its course northward, and produced the phenomena before mentioned in Scotland. The same observation may likewise be made with regard to 1789, when there were slight shocks of an earthquake both in England and Scotland. That in England was followed by an uncommon frequency of thunder and lightning in the southern parts of Scotland; by the progress of the electric matter northward after it was discharged into the atmosphere: but the shocks which happened in the northern part of Scotland (viz. about Crief and Comrie in Perthshire) were not followed by thunder to the southward; because the electric matter, though discharged into the atmosphere, cannot return to the south without first going north, and rising up into the higher regions." The Encyclopædists, however, acknowledge that, "in the earthquakes in Calabria in 1783, there were some circumstances which seem to militate against this theory. The most remarkable of these is their attacking the places situated on the plain, much more than those which stood on the higher grounds. In a memoir on this earthquake by M. Dolomieu, that author endeavours to exclude electricity from having any share in the matter: and ascribes the whole phenomena to steam occasioned by the rains of 1782—3, accumulated in caverns under Calabria, and heated by the fires of Etna. But not to mention other evi-

dences, a single circumstance, which M. Dolomieu himself mentions, is a sufficient proof of electricity being concerned; and that is the presentiment which animals had of its approach. "The presentiment of animals (says he) at the approach of earthquakes, is a singular phenomenon, and which cannot fail to surprise us so much the more, as we know not by what organs it is communicated to them. Every species of animals experience it, especially dogs, geese, and poultry. The howlings of the dogs in the streets of Messina were so loud, that orders were issued to kill them." Now, we know, that many animals have a presentiment of a change of weather; which may happen either from a change of the density of the atmosphere, or from some alteration in its electricity: but steam pent up in the bowels of the earth could affect no animal until it began to exert its effects. Sir William Hamilton likewise informs us, that geese seemed more affected by this cause when in the water than out of it; which may easily be explained upon electrical principles, but not at all, at least not without the most extravagant suppositions, by steam pent up in caverns nobody knows where. Again, it is evident, that M. Dolomieu's hypothesis is supported in the worst manner imaginable, viz. by arguing from things unknown to what we see; but the true method of argument always is from what we see to things unknown. By this error he has made choice of causes which cannot possibly answer the purpose. Let any quantity of water be poured into the focus of mount Etna; nay, let the sea itself break into it: the consequence could only have been what happened in 1755, viz. not an earthquake in Calabria, but a vast effusion of boiling water from the top of the mountain itself. Nature here made the experiment; and we have no reason to imagine that any other consequence would have followed, though it had been repeated ever so often. Our author seems also to have forgot, that aqueous steam is capable of condensation, and that when it is admitted into a cold place it instantly loses its expansive power. Let us suppose caverns upon caverns extended in any way he pleases: the greater their bulk, the more will he be embarrassed; for thus the steam would have room to circulate; and far from producing those dreadful convulsions, must have returned quietly into water, without being able to stir the earth in the least. It would appear indeed, that the power of aqueous steam is very much over-rated both by M. Dolomieu and other writers. As Nature, or rather the Author of Nature, does nothing in vain, it may not be improper to consider, what uses earthquakes may be supposed to answer in the general system. As they are the effects of the very highest natural power, it cannot be supposed, that they are produced merely for the purposes of destruction; and, on the other hand, as they certainly do a great deal of mischief, it seems as difficult to assign any benevolent purpose. It is thought, indeed, that earthquakes are the means by which Nature raises mountains and land from the bottom of the sea; but this can never be admitted. We have many instances of mountains being swallowed up and lost by earthquakes, but not a single well attested one of a mountain being raised by them; and even when volcanoes are taken into the account, by which some mountains and islands have certainly been raised, the balance appears against them, and more land appears to have been sunk by them than ever was raised. It seems most probable, therefore, that earthquakes are accidental, and that the mischief they do is only to prevent a greater evil. This we see takes place throughout the whole system of nature. Thunder and lightning, violent rains, storms of wind, &c. are all productive of much damage on certain occasions; but we by no means suppose these phenomena to take place merely for the destruction; and therefore we name such effects accidents. To the same account, on a larger scale, must we place earthquakes; and it only remains to consider, what are the disasters still more terrible than earthquakes, which we should have occasion to dread did they not interpose to prevent them. These evils are naturally to be dreaded from any general commotion of the electric fluid dispersed through the whole globe of earth. That it does pervade it to the centre, is what we can have no reason to doubt; but in the internal parts it seems to lie dormant, or to be employed in operations which never manifest themselves to us. Towards the surface it is set in motion by the light of the sun. This produces a constant current through the bowels of the earth from the equator towards the poles; for as the equatorial parts absorb more of the light than those farther S. or N. it must naturally be driven out in the northern and southern regions in proportion to the quantity absorbed at the equator.

equator. Earthquakes are the shocks occasioned by its passing in great quantity from one place where it is pressed and confined, to another from which it has a free passage; or from a part of the earth positively electrified, to one that is negatively so. Let us suppose, however, that such obstructions are thrown in its way, that it cannot get out of the earth by any passage. The consequence of this must very soon be, that the motion of the light acting upon the equatorial parts would be propagated through the whole globe; and this would be productive of consequences much more terrible than any we can conceive. We see that by setting it in motion in a small part of the atmosphere or of the earth, the most violent effects ensue; but should this tremendous fluid be obliged to put forth all its strength, the earth must be shaken from the centre. Instead of plantations and little hills removed from their places, as in Calabria, it is probable that the largest islands and continents would be detached from their bases, or perhaps an universal dissolution ensue. Happily, however, such an effect can never take place, because the electric matter always vents itself by the superficial parts; for the depths to which even the causes of earthquakes and volcanoes descend, are undoubtedly superficial in comparison of the vast thickness of the body of the earth itself. The great bulk of electric fluid therefore lies quietly in the central parts; and is never moved by the commotions of that which lies on the surface, any more than the water at the bottom of the ocean is moved by the storms which ruffle the upper part.

EARWIG, in zoology. See **FORFICULA**.

EASEL, among painters; the frame whereon the canvas is laid.

EASEL PIECES, such small pieces, either portraits or landscapes, as are painted on the easel; thus called to distinguish them from larger pictures drawn on walls, ceilings, &c.

EASEMENT, in law, a privilege or convenience which one neighbour has of another, whether by charter or prescription, without profit: such are a way through his lands, a sink, or the like. These, in many cases, may be claimed.

EASING, in the sea language, signifies the slackening of a rope or the like. Thus, to ease the bow-line or sheet, is to let them go slack; to ease the helm, is to let the ship go more large, more before the wind, or more larboard.

EASINGWOLD, a town in the N. Riding of Yorkshire; 13 miles N. N. W. of York. Lon. 1. 4. W. Lat. 54. 10. N.

EAST, [*east*, Saxon; *heos*, Erse,] one of the four cardinal points of the world; being that point of the horizon where the sun is seen to rise when in the equinoctial. In Italy, and throughout the Mediterranean, the east wind is called the levante: in Greek *ανατολη* and *απηνιωτης*, because it comes from the side of the sun, *επ' ηλιου*; in Latin, *eurus*.

EASTBOURN, a town of Sussex. It lies near Beachy Head, 16 miles S. E. of Lewes.

EASTER, called by the Greeks, *Πασχα*, and by the Latins *Pascha*, from *פסח*, a Hebrew word signifying passage, applied to the Jewish feast of the passover. It is called Easter in English, from the Saxon goddess Eostre, whose festival was held in April. The Asiatic churches kept their Easter upon the very same day that the Jews observed their passover, and others on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice; when it was ordained that Easter should be kept upon one and the same day, which should always be Sunday, in all Christian churches in the world. See **CHRONOLOGY**.

EASTER ISLAND, an island in the South Sea, thought to have been first discovered in 1686, by one Davis an Englishman, who called it Davis's Land. It was next visited by Commodore Roggewein, a Dutchman, in 1722; who gave it the name of Easter Island. The island is extremely barren; and bears evident marks not only of a volcanic origin, but of having been not very long ago entirely ruined by an eruption. It is 36 miles in circumference. Lon. 109. 46. W. Lat. 27. 5. S.

EAST INDIES. See **HINDOSTAN**, and **INDIA**.

EAST-NESS, or **EASTONNESS**, a cape in the German ocean, on the east coast of England, and county of Suffolk, between Southwold and Lowestoff.

EAST-NESS, on the coast of Yorkshire, near Rydel.

EASTON, a town of the United States, in Maryland, the capital of Talbot county, formerly named Talbot Court-House.

EASTON, a town of Pennsylvania, the capital of Northampton county, 70 miles N. of Philadelphia.

EAST POINT, the N. E. extremity of New Holland.

EATON, a town of England, in Buckinghamshire, on the N. side of the Thames, opposite to Windsor; famous for its collegiate school, founded by Henry VI. being a seminary for King's College, Cambridge, the fellows of which are all from this school.

EAU, [*Fr.*] signifies water; and hence makes part of the names of several compositions in perfumery, pharmacy, &c.

EAVES, in architecture, the margin or edge of the roof of a house; being the lowest tiles, slates, or the like, that hang over the walls, or throw off water to a distance from the wall.

EAVES-LATH, a thick feather-edged board, generally nailed round the eaves of a house for the lowermost tiles, slates, or shingles to rest on.

EAUSE, or **EAUZE**, an ancient town of France, in the department of Gersey, and province of Armagnac, 17 miles S. W. of Condom.

EBDOMADARIUS, **EBDOMAGENES**, or **HEBDOMADARIUS**. See **HEBDOMADARIUS**, &c.

EBENUS, the **EBONY TREE**; a genus of the decandria order, and diadelphia class of plants; natural order, Papilionaceæ. Calyx with teeth, the length of the corolla; wings scarcely any; seed one rough with hairs. It has two species, viz. *E. Cretica*, Cretan ebony, and *E. pinnata*, pinnated ebony: the former grows naturally in Crete, and some islands of the Archipelago; the latter is found in Barbary and the Levant.

EBERBEG, or **EBERNBERG**, a town of Germany, now included in one of the new departments on the left bank of the Rhine, five miles S. W. of Creuznach.

EBERNSTEIN, a town of Germany, in the duchy of Carinthia, twelve miles N. N. E. of Clagenfurt.

EBERSPERG, a town of Germany, in Bavaria, 19 miles E. of Munich.

EBERSTEIN, a town of France, in the department of the Lower Rhine, and late province of Alsace, eight miles S. W. of Strasburg.

EBERSTEIN, a principality and county of Germany, in Suabia, between Baden and Wurtemberg.

EBERSTEIN, a town and fort in the above county six miles S. E. of Baden.

EBERVIL, or **EBERVILLE**, a town of France, in the department of Puy de Dome, and late province of Auvergne, eight miles from Riom.

EBHER, a river and town of Persia, in the province of Irak.

EBION, the author of the heresy of the Ebionites, was a disciple of Cerinthus, and his successors. To the errors of his master, he had added new opinions of his own. He began his preaching in Judea; he taught in Asia, and even at Rome. His tenets infected the isle of Cyprus. St. John opposed both Cerinthus and Ebion in Asia; and it is thought that he wrote his gospel, in the year 97, particularly against this heresy.

EBIONITES, ancient heretics, who rose in the very first age of the church, formed themselves into a sect in the second century, denying the divinity of Jesus Christ. Origen takes them to have been so called from the Hebrew word *ebion*, which signifies poor; because, they were poor in understanding. Eusebius is of opinion they were thus called, as having poor thoughts of Jesus Christ, taking him for no more than a mere man. It is more probable the Jews gave this appellation to the Christians in general out of contempt: because in the first age few but poor people embraced the Christian religion. This opinion Origen himself seems to give into, in his book against Celsus, where he says, that they called Ebionites, such among the Jews as believed that Jesus was truly the expected Messiah. There is even some probability, that the primitive Christians assumed the name themselves, in conformity to their profession. It is certain, Epiphanius observes, they valued themselves on being poor, in imitation of the apostles. The same Epiphanius, however, is of opinion, that there had been a man of the name of Ebion, the founder of the sect, contemporary with the Nazarenes and Cerinthians. He gives a long and exact account of the origin of the Ebionites, making them to have risen after the destruction of Jerusalem, when the first Christians, called Nazarenes, went out of it to live at Pella. The Ebionites seem to have been a branch of Nazarenes: only they altered and corrupted the

purity of the faith held among those first adherents to Christianity. For this reason, Origen distinguishes two kinds of Ebionites, in his answer to Celsus: the one believed that Jesus Christ was born of a virgin: and the other, that he was born after the manner of other men. The first was orthodox in every thing, except that to the Christian doctrine they joined the ceremonies of the Jewish law, with the Jews, Samaritans, and Nazarenes; together with the traditions of the Pharisees. They differed from the Nazarenes, chiefly as to what regards the authority of the sacred writings; for the Nazarenes received all for scripture contained in the Jewish canon; whereas the Ebionites rejected all the prophets, and held the very names of David, Solomon, Isaiah, Jeremiah, and Ezekiel, in abhorrence. They also rejected all St. Paul's epistles, whom they treated with the utmost disrespect. They received nothing of the Old Testament but the Pentateuch; which should intimate them to have descended rather from the Samaritans than from the Jews. They agreed with the Nazarenes in using the Hebrew gospels of St. Matthew, otherwise called the Gospel of the Twelve Apostles; but they had corrupted their copy in many places; and particularly, had left out the genealogy of our Saviour, which was preserved entire in that of the Nazarenes, and even in those used by the Cerinthians.

EBONY, an exceedingly hard and heavy kind of wood, susceptible of a very fine polish, and on that account used in mosaic and inlaid works, toys, &c. There are divers kinds of ebony: the most usual among us are black, red, and green, all produced in the island of Madagascar, where the natives call them indifferently *hazon mainthi*, *q. d.* black wood. The island of St. Maurice likewise furnishes part of the ebonyes used in Europe. Authors and travellers give very different accounts of the tree that yields the black ebony. By some of their descriptions it seems to be a sort of palm-tree; by others, a *cytisus*, &c. The most authentic is that of M. Flacourt, who resided many years in Madagascar as governor; he assures us, that it grows very high and big, its bark being black, and its leaves resembling those of our myrtle, or a deep, dusky, green colour. Tavernier assures us, that the islanders always bury trees, when cut down, to make them the blacker, and to prevent their splitting when wrought. F. Plumier mentions another black ebony tree, discovered by him at St. Domingo, which he calls "*spartium portulacæ foliis aculeatum ebeni materie*." Pliny and Dioscorides say the best ebony comes from Ethiopia, and the worst from India; but Theophrastus prefers the Indian. Black ebony is much preferred to that of other colours. The best is a jet black, free from veins and rind, very massive, astringent, and of an acrid pungent taste. Its rind, infused in water, is said to purge piltuita, and cure venereal disorders; whence Matthiolus took guaiacum for a sort of ebony. It yields an agreeable perfume when laid on burning coals: when green, it readily takes fire from the abundance of its fat. If rubbed against a stone, it becomes brown. The Indians make statues of their gods, and sceptres of their princes, of this wood. It was first brought to Rome by Pompey, after he had subdued Mithridates. It is now much less used among us than anciently; since the discovery of so many ways of giving other hard woods a black colour. The cabinet-makers, inlayers, &c. make pear-tree and other woods pass for ebony, by giving them a black colour, by a few washes of a hot decoction of galls; and when dry, adding ink, and polishing them with a stiff brush, and a little hot wax. Others burn their wood black.

EBORACUM, in ancient geography, a famous city of the Brigantes in Britain, now called York, which see.

EBRBUHARITES, a sect among the Mohammedans, so named from their founder Ebrbuhar, a disciple of Nacschibendi. They profess great sanctity, with a total dereliction of all worldly things; yet are regarded by the other Mussulmans, as little better than heretics, because they do not go in pilgrimage to Mecca. From this labour they excuse themselves, by pretending that the purity of their souls, their sublime contemplations, ecstasies, &c. shew them Mecca and Mohammed's tomb without stirring from their cells.

EBREUIL, or **EBREUILLE**, a town of France, in the department of Allier, 6 miles W. of Gannat.

EBRO, a large river of Spain, which rises in the mountains of Santillane, on the confines of Old Castile, and falls with great rapidity into the Mediterranean, about 20 miles below Tortosa. It was anciently called Iberus.

EBSTORE, a town of Germany, in Lower Saxony, 47 miles W. N. W. of Ultzen.

EBULLITION, [*ebullitio*, Lat.] the act of boiling up with heat; any intestine violent motion of the parts of a fluid.

EBUSUS, in ancient geography, the greater of the two islands called Pityusæ, in the Mediterranean, S. W. of Majorca. Now called Ivica, 100 miles in compass, without any noxious animals.

ECASTOR, or **MECASTOR**, in antiquity, an oath wherein Castor was invoked. It was a custom for men never to swear by Castor, nor the women by Pollux.

ECAVESSADE, in the manege, is used for a jerk of the cavesson.

ECBATANA, in ancient geography, the royal residence and capital of Media, built by Deioces, king of the Medes, according to Herodotus: Pliny says, by Seleucus; but that could not be, because it is mentioned by Demosthenes. It was situated on a gentle declivity, twelve stadia from Mount Orontes, and was in compass 150 stadia. Here stood the royal treasury and tombs. It was an open unwall'd town, but had a very strong citadel, encompassed with seven walls, within and rising above each other. The extent of the utmost was equal to the whole extent of Athens, according to Herodotus; the situation favouring this construction, as being a gentle ascent, and each wall was of a different colour.

ECBATANA, another town of Persia, inhabited by the Magi.

ECCENTRICAL, or **ECCENTRIC**, [*eccentricus*,] 1. Deviating from the centre. 2. Not having the same centre with another circle: such circles were supposed by the Ptolemaic philosophy.

ECCENTRICITY OF THE PLANETS, the distance between the sun and the centre of the orbit in which the planet moves. See **ASTRONOMY**.

ECHELLENSIS, **ABRAHAM**, a learned Maronite, whom the president Le Jai employed in the edition of the Polyglott Bible. Gabriel Sionita, his countryman, drew him to Paris, to make him his fellow-labourer in publishing that bible. They fell out: Gabriel complained to the parliament, and defamed his associate; their quarrel made a great noise. The congregation de propaganda fide associated him, in 1636, with those whom they employed in making an Arabic translation of the scriptures. They recalled him from Paris, and he laboured in that translation at Rome, in 1652. While he was professor of the Oriental languages at Rome, he was pitched upon by the great duke Ferdinand II. to translate from Arabic into Latin the 5th, 6th, and 7th of Apollonius's Conics; in which he was assisted by John Alphonso Borrelli, who added commentaries to them. He died at Rome, in 1664.

ECCHYMOSIS, [from *εκχυω*, to pour out, or from *εξ*, out of, and *χυμος*, juice,] an effusion of humours from their respective vessels, under the integuments; or, as Paulus Aegineta says, "When the flesh is bruised by the violent collision of any object, and its small veins broken, and the blood is gradually discharged from them." This blood, when collected under the skin, is called an ecchymosis, the skin in the mean time remaining entire; sometimes a tumour is formed by it, which is soft and livid, and generally without pain. If the quantity of blood is not considerable, it is usually resorbed; if much, it suppurates: it rarely happens that any farther inconvenience follows; though in a very bad habit of body, a mortification may be the result.

ECCLESFECHAN, a town of Scotland, in Dumfries-shire, 15 miles E. of Dumfries. It has a fair once a month.

ECCLESHALL, a town in Staffordshire, 7 miles N. W. of Stafford. Lon. 2. 9. W. Lat. 53. 2. N.

ECCLESIANI, or **ECCLESIANI**, in church history, a title given by the adherents of the emperors, to those who adhered to the interest of the church, during the disputes between the emperors and popes.

ECCLESIASTES, a canonical book of the Old Testament, the design of which is to shew the vanity of all sublunary things. It was composed by Solomon; who enumerates the several objects on which men place their happiness, and then shews the insufficiency of all worldly enjoyments. The Talmudists make king Hezekiah to be the author of it: Grotius ascribes it to Zorobabel, and others to Isaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after

after having experienced all the pleasures, follies, and vanities of life.

ECCELESTASTICAL COURT. See **COURTS, ECCELESTASTICAL.**

ECCELESTASTICAL STATE, in geography, lately the Pope's dominions in Italy. They consisted of the following provinces: Campagna, St. Peter's Patrimony, Umbria, Ancona, Urbino, Romagna, Bologna, and Ferrara. Avignon and Venaissin included in the French empire, also belonged to the Ecclesiastical State; as well as the duchy of Benevento, in Naples, which last, was the last that his holiness retained of his ancient dominions. The kingdom of Naples and the duchies of Parma and Placentia also held as fiefs of the papal see. Pope Paul IV. who succeeded Marcellus II. in 1555, boasted, that he had 22,800 parishes, 4400 monasteries under his jurisdiction. In obedience to a French imperial decree of May 17, 1809, the Ecclesiastical States are now annexed to the empire of France; and in Feb. 1810, divided into two departments, viz. those of Rome and Trazimene.

ECCELESTASTICUS, an apocryphal book, so called, from its being read in the church, ecclesia, as a book of piety and instruction, but not of infallible authority. The author was a Jew, called Jesus, or Joshua, the son of Sirach. The Greeks call it the Wisdom of the son of Sirach.

ECCELESTON, a town of Lancashire, 24 miles S. of Lancaster. Lon. 2. 55. W. Lat. 53. 40. N.

ECCLISIS, [*ἐκκλησία*, Gr.] a luxation.

ECCO, in music books, signifies the repetition of part of a tune, in imitation of an echo.

ECCOPROTICS, [*ἐκκαὶ πρὸς*, Gr.] such medicines as gently purge the belly, so as to bring away no more than the natural excrements lodged in the intestines.

ECSCRINOLOGICA, [*ἐκσκληνολογία*, Gr.] that part of medicine, which treats of excretions.

ECDICI, [*ἐκδικαί*, Gr.] among the ancients, patrons of cities, who defended their rights, and took care of the public money.

ECDYSSIA, an ancient festival held by the Phœstians, in honour of Latona.

ECHALLENS, a town of the Helvetic republic, in the late canton of Bern, 6 miles from Lausanne.

ECHALLENS, a late bailiwick of Switzerland, belonging to the cantons of Bern and Friburg.

ECHAPE, [*échappee*, Fr. a prank,] in the manege, a horse begot between a stallion and a mare of different breeds and countries.

ECHAPER, [*échapper*, Fr. to escape,] in the manege, a term used in the academies implying to give a horse a head, or to put on at full speed.

ECHENEIS, the **REMORA**, in ichthyology, a genus of the order of thoracici. Head flat, naked, depressed, and marked with a number of transverse ridges; it has ten rays in the branchiostegic membrane; and the body is naked. There are six species, natives of the Indian ocean.

ECHEVIN, in the late French and Dutch polity, a magistrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanliness of the city.

ECHINITES, in natural history, the name by which authors call the fossile centronia, frequently found in our chalk pits.

ECHINOPHORA, a genus of the digynia order, and pentandria class of plants; natural order, Umbellata. Male florets lateral, with the central one hermaphrodite; seed one, sunk into an indurated involucre. It has two species.

ECHINOPUS, in botany, a genus of the polygamia segregata order, and syngenesia class of plants; natural order, Compositae. Calyx uniflorous; corolla tubulated, hermaphrodite; receptacle bristly; down indistinct. Five species, herbaceous plants, with alternate leaves.

ECHINORYNCHUS, in natural history, a genus of the class and order *vermes* *intestina*. Body round; proboscis cylindrical retractile, and crowned with hooked prickles. These animals are found fixed very firmly to the viscera of various animals, generally the intestines; and often remain on the same part during the life of the animal. There are about fifty species, divided into sections: A. infesting mammalia, of this E. *gigas* is found in the intestines of swine. B. infesting birds. C. infesting reptiles. D. infesting fish.

ECHINUS, **SEA-URCHIN**, in natural history, a genus of the

class and order *vermes* *mollusca*. Body roundish, covered with bony satured crust, and generally furnished with moveable spines; mouth placed beneath, and mostly five-valved. They are divided into sections, chiefly distinguished by the situation of the vent. A. vent vertical; tentacula every where simple. B. vent placed beneath; mouth without tentacula. C. vent lateral; mouth with pencilled tentacula. Each of these sections are subdivided. There are more than 100 species, besides varieties. They are all inhabitants of the sea, and many of them have been found in a fossil state; many are esculent. In old times they were a favourite dish. They were dressed with vinegar, honied wine or mead, parsley or mint; and thought to agree with the stomach.

ECHITES, in botany, a genus of the monogynia order, and pentandria class of plants; natural order, Contortae. Follicles two, long and straight; seeds downy; corolla funnel-shaped, with the throat naked. Twenty-two species, mostly natives of the West Indies.

ECHIU, **VIPER'S BUGLOSS**, in botany, a genus of the monogynia order, and pentandria class; natural order, Asperifoliae. Corolla irregular, with the throat naked. There are twenty-one species.

ECHIU **VULGARE**, or **COMMON BUGLOSS**, the flowers of which are very grateful to bees. It is a native of many parts of Britain. The stem is rough with hairs and tubercles. The leaves are spear-shaped, and rough with hair.

ECHO, or **ECCHO**, is formed from the Greek *ἠχέω*, *sound*. The ancients being wholly unacquainted with the true cause of the echo, ascribed it to several causes sufficiently whimsical. The poets, who were not the worst of their philosophers, pretended it was a person of that name metamorphosed, and that she affected to take up her abode in particular places; for they found that she was not to be met with every where. But the moderns, who knew sound to consist in a certain tremor or vibration in the sonorous body communicated to the contiguous air, and by that means to the ear, give a more consistent account of echo. See **ACOUSTICS**. A tremulous body, striking on another solid body, may be repelled without destroying or diminishing its tremor; and consequently a sound may be redoubled by the resiliency of the tremulous body, to the air. But a simple reflection of the sonorous air is not enough to solve the echo: for then every plain surface of a solid hard body, being fit to reflect a voice or sound, would redouble it; which we find does not hold. To produce an echo, therefore, it should seem, that a kind of concameration or vaulting were necessary, to collect, and by collecting to heighten and increase, and afterwards reflect the sound; as we find is the case in reflecting the rays of light, where a concave mirror is required. In fact, as often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault or arch, or even another parallel wall; so often will it be reverberated in the same line, or other adjacent ones. For an echo to be heard, therefore, it is necessary that the ear be in the line of reflection: for the person who made the sound to hear its echo, it is necessary he be perpendicular to the place which reflects it: and for a manifold or tautological echo, it is necessary there be a number of walls, and vaults or cavities, either placed behind or fronting each other. A single arch or concavity, &c. can scarce ever stop and reflect all the sound; but if there be a convenient disposition behind it, part of the sound propagated thither, being collected and reflected as before, will present another echo: or, if there be another concavity, opposed at a due distance to the former, the sound reflected from the one upon the other will be tossed back again by this last, &c. Many of the phenomena of echoes are well considered by the bishop of Leighs, &c. who remarks, that any sound, falling directly or obliquely on any dense body of a smooth superficies, whether plain or arched, is reflected, or echoes, more or less. The surface, says he, must be smooth; otherwise the air, by reverberation, will be put out of its regular motion, and the sound thereby broken and extinguished.

ECHO, is also used for the place where the repetition of the sound is produced or heard. In echoes, the place where the speaker stands is called the *centrum phonicum*; and the object or place that returns the voice, the *centrum phonocampticum*. Echoes are distinguished into two kinds; viz. Single and Tautological, or Multiple.

i. **ECHOES, SINGLE**, are those which return the voice but once. Of these some are Tonical, others Polysyllabical.

1. **ECHOES**,

1. **ECHOES, POLYSYLLABICAL**, are those which return many syllables, words, and sentences. Of this last kind is that fine echo in Wood-stock park, which Dr. Plot assures us, in the day-time, will return very distinctly 17 syllables, and in the night 20.

2. **ECHOES, TONICAL**, are those which only return a voice, when modulated into some particular musical tone.

ii. **ECHOES, TAUTOLOGICAL, or MULTIPLE**, are those that return syllables and words, the same oftentimes repeated. At the sepulchre of Metella, wife of Crassus, was an echo, which repeated what a man said five times. Authors mention a tower at Cyzicus, where the echo repeated seven times. One of the finest echoes we read of is that mentioned by Barthius, in his notes on Statius Thebais, lib. vi. 30, which repeated the words a man uttered 17 times: it was on the banks of the Naha, between Coblentz and Bingen. Barthius assures us, he had proved what he writes; and had told 17 repetitions. In common echoes, the repetition is not heard till some time after hearing the word spoken, or the notes sung; but in this, the person who speaks or sings is scarce heard at all; but the repetition most clearly, and always in surprising varieties; the echo seeming sometimes to approach nearer, and sometimes to be further off. Sometimes the voice is heard very distinctly, and sometimes scarce at all. One hears only one voice, and another several: one hears the echo on the right, and the other on the left, &c. At Milan in the late Cisalpine republic, is an echo which reiterates the report of a pistol 56 times; and if the report is very loud, upwards of 60 reiterations may be counted. The first 20 echoes are pretty distinct; but as the noise seems to fly away, and answer at a great distance, the reiterations are so doubled, that they can scarce be counted.

ECHO, in architecture, a term applied to certain kinds of vaults and arches, most commonly of the elliptic and parabolic figures used to redouble sounds, and produce artificial echoes.

ECHO, in poetry, a kind of composition wherein the last words or syllables of each verse contains some meaning, which, being repeated apart, answers to some question or other matter contained in the verse; as in this beautiful one from Virgil:

Crudelis mater magis, an puer improbus ille?

Improbus ille puer, crudelis tu quoque mater.

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind and by that means affect it with surprise and admiration.

ECHO, in the mythology, a daughter of Aer and Tellus, who chiefly resided in the vicinity of the Cephissus. She was once one of Juno's attendants, and became the confidant of Jupiter's amours. Her loquacity however displeased Jupiter, and she was deprived of the power of speech by Juno, and only permitted to answer the questions which were put to her. Echo, after she had been punished by Juno, fell in love with Narcissus; but being despised by him, pined to death, having nothing but her voice left.

ECHOMETER, [$\epsilon\chi\omicron\mu\epsilon\tau\epsilon\rho$, sound, and $\mu\epsilon\tau\epsilon\rho\omega$ to measure,] among musicians, a kind of scale or rule, with several lines thereon, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECIJA, or EXIJA, a town of Spain, in Andalusia, 55 miles E. N. E. of Seville.

ECKARDSBERGA, a town of Germany in Upper Saxony, 10 miles W. S. W. of Naumburg.

ECKTERNAC, a town of France, in the department of Forets, 18 miles N. E. of Luxembourg. Lon. 6. 33. E. Lat. 49. 50. N.

ECCLECTICS, [from $\epsilon\kappa\lambda\epsilon\gamma\omega$, to choose,] ancient philosophers, who, without attaching themselves to any particular sect, chose what they judged good and solid from each. Laertius says that they were also denominated Analogetici; but that they call themselves Philalethes, i. e. lovers of truth. The founder of the Eclectici was one Potamon of Alexandria, who lived under Augustus and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the Eclectic sect; which Vossius calls the Elective.

ECCLECTICS were also a certain set of physicians among the ancients, of whom Archigenes, under Trajan, was the chief, who selected from the opinions of all the other sects, that which appeared to them best and most rational; hence they were called eclectics, and their prescriptions *medicina eclectica*.

ECCLECTICS, or MODERN PLATONICS, a sect of Christians, who arose about the end of the second century. They professed to make truth the only object of their enquiry, and to be ready to

adopt from all the different systems and sects; such tenets as they thought agreeable to it. However, they preferred Plato to the other philosophers, and looked upon his opinions concerning God, the human soul, and things invisible, as conformable to the spirit and genius of the Christian doctrine.

ECLEGMA, [$\epsilon\kappa$ and $\lambda\epsilon\gamma\mu\alpha$,] a form of medicine made by the incorporation of oils with syrups, and which is to be taken upon a liquorice stick.

ECLIPSE, [$\epsilon\kappa\lambda\iota\psi\iota\varsigma$,] an obscuration of the luminaries of heaven; the sun is eclipsed by the intervention of the moon; the moon by the interposition of the earth. See **ASTRONOMY**.

ECLIPTA, in botany, a genus of the polygamia superflua order, and syngenesia class. Receptacle chaffy; no pappus; corollulae of the disk quadrifid. It has five species natives of both the Indies.

ECLIPTIC, [$\epsilon\kappa\lambda\iota\pi\tau\iota\kappa\omicron\varsigma$,] a great circle of the sphere, passing through the middle of the Zodiac. See **ASTRONOMY**.

ECLOGUE, [$\epsilon\kappa\lambda\omicron\gamma\eta$, Gr. *choice*,] in poetry, a kind of pastoral composition, wherein shepherds are introduced conversing together. According to the etymology, eclogue should be no more than a select or choice piece; but custom has determined it to a farther signification, viz. a little elegant composition in a simple natural style and manner. Idyllion and eclogue, in their primary intention, are the same thing: thus, the idyllia, $\alpha\iota\delta\upsilon\lambda\lambda\iota\alpha$, of Theocritus, are pieces written perfectly in the same vein with the eclogæ of Virgil. But custom has made a difference between them, and appropriated the name eclogue to pieces wherein shepherds are introduced speaking; idyllion, to those written like the eclogue, in a simple natural style, but without any shepherds in them.

ECLUSE, a town of France, in the department of the North, and late province of Dutch Flanders. Lon. 3. 10 E. Lat. 50. 52. N.

ECONOMY, [$\omicron\iota\kappa\omicron\nu\omicron\mu\iota\alpha$,] a term of extensive signification, and if its meaning be properly understood and practised, the result cannot fail to be attended with the happiest effects. It is, in particular, applied to rural, domestic, animal, political, and other objects, to denote the regulation and management of them, and the ascertaining of their uses, advantages, &c.

ECONOMICS, the art of managing our affairs in an appropriate and advantageous manner.

ECOUTE, in the manege, a pace or motion of a horse, when he rides well upon the hands and the heels, is compactly put upon his haunches, and hears or listens to the heels or spurs, and continues duly balanced between the heels, without throwing to either side. This happens when a horse has a fine sense of the aids of the hand and heel.

ECPHORA, in architecture, commonly signifies the distance between the extremity of a member or moulding, and the naked of the column, or any other part it projects from. Some authors, however, account for the ecphora from the axis of the column, and define it to be the right line intercepted between the axis and the outermost surface of a member or moulding.

ECPHRACTICS, [$\epsilon\kappa$ and $\phi\epsilon\rho\alpha\tau\iota\omega$,] such medicines as render tough humours more thin, so as to promote their discharge. See **ATTENUANT**, **DEOBSTRUENT**, and **DETERGENTS**.

ECSTATICI, [$\epsilon\kappa\varsigma\tau\alpha\tau\iota\kappa\iota$, from $\epsilon\zeta\iota\varsigma\tau\eta\mu\iota$, I am entranced,] in antiquity, a kind of diviners who were cast into trances or ecstasies, in which they lay like men dead or asleep, deprived of all sense and motion; but, after some time, returning to themselves, gave strange relations of what they had seen and heard.

ECTHESIS, [Gr.] in church history, a confession of faith, in the form of an edict, published A. D. 639, by the emperor Heraclius, to pacify the troubles occasioned by the Eutychian heresy in the eastern church.

ECTHLIPSIS, among Latin grammarians, a figure of prosody whereby the *m* at the end of a word, when the following word begins with a vowel, is elided, or cut off, together with the vowel preceding it, for the sake of the measure of the verse: thus, for "Monstrum horrendum, informe, ingens, cui lumen ademptum" they read, Monstru' horrend' inform' ingens, cui lumen ademptum.

ECTROPIUM, in surgery, is when the eye-lids are inverted, or retracted, so that they shew their internal or re surface, and cannot sufficiently cover the eye.

ECTYLOTICS, remedies proper or-consuming callosities.

ECTYPE, [$\epsilon\kappa\tau\upsilon\pi\omicron\varsigma$,] among antiquarians, an impression of a medal,

medal, seal, or ring, or a figured copy of an inscription, or other ancient monument.

ECU, a French crown. See COIN.

EDA, one of the Orkney islands.

EDAM, a town of Batavia, or Holland, in the department of Amstel, 12 miles N. of Amsterdam. Lon. 4. 58. E. Lat. 52. 32. N.

EDDA, the system of the ancient Icelandic or Runic mythology, containing many curious particulars of the theology, philosophy, and manners, of the northern nations of Europe; or of the Scandinavians, who had migrated from Asia, and from whom our Saxon ancestors were descended. Mr. Mallet apprehends that it was originally compiled, soon after the Pagan religion was abolished, as a course of poetical lectures, for the use of such young Icelanders as devoted themselves to the profession of a scald or poet. It consists of two principal parts; the first containing a brief system of mythology, properly called the Edda; and the second being a kind of art of poetry, and called *Scalda* or poetics. The most ancient Edda was compiled by Soemund Sigfusson, surnamed the Learned, who was born in Iceland about A. D. 1057. This was abridged, and rendered more easy and intelligible about 120 years afterwards, by Snorro Sturleson, who was supreme judge of Iceland in 1215 and 1222; and it was published in the form of a dialogue. He added also the second part in the form of a dialogue, being a detail of different events transacted among the divinities. The only three pieces that are known to remain of the more ancient Edda of Soemund are the Voluspá, the Havamaal, and the Runic chapter. The Voluspá or prophecy of Vola or Fola, appears to be the text, on which the Edda is the comment. It contains in 200 or 300 lines the whole system of mythology, disclosed in the Edda, and may be compared to the Sibylline verses, on account of its 'laconic' yet 'bold style, and its imagery and obscurity.

EDDISTO, or PONPON, a large river of South Carolina.

EDDY WIND is that which returns or is beat back from a sail, mountain, or any thing that may hinder its passage.

EDDYSTONE ROCKS, the name of some rocks in the English Channel; so called from the great variety of contrary currents in their vicinity. They are situated nearly S. S. W. from the middle of Plymouth Sound, their distance from the port about 14 miles, and from Ram-Head, the nearest point of land, 12 and a half. They are almost in the line which joins the Start and the Lizard Points; and as they lie nearly in the direction of vessels coasting up and down the Channel, they were very dangerous, and ships were sometimes wrecked on them, before the light-house was established. They are so exposed to the swells of the ocean, from all the S. and W. points of the compass, that the heavy seas come uncontrolled and break on them with the utmost fury. Sometimes, after a storm, when the sea in general is, to all appearance, quite smooth, and its surface unruffled by the slightest breeze, the growing swell or under current, meeting the slope of the rocks, the sea beats dreadfully upon them, and even rises above the light-house in a magnificent manner, overtopping it for the moment, as with a canopy of frothy wave. Notwithstanding this tremendous swell, Mr. Henry Winstanley, in 1696, undertook to build a light-house on the principal rock, for the rest are under water; and he completed it, in 1700. This ingenious mechanic was so confident of the stability of his structure, that he declared his wish to be in it, during the most tremendous storm that could blow. Unfortunately he obtained his wish, for he perished in it, during the dreadful storm which destroyed it, on the 27th Nov. 1703. In 1709, another light-house was erected of wood on this rock, but on a different construction, by Mr. John Rudyard. It stood till 1755, when it was burnt. A third one, of stone, was begun by the late celebrated Mr. John Smeaton, on the 2nd of April 1757, and finished 24th Aug. 1759: and has withstood the rage of all weathers ever since. The rock, which slopes towards the S. W. is cut into horizontal steps; into which are dove-tailed and united by a strong cement Portland stone and granite: for Mr. Smeaton discovered, that it was impossible to make use of the former entirely, as there is a marine animal that can destroy it; and that he could not use the latter solely, as the labour of working it would have been too expensive. He therefore used the one for the internal and the other for the external part of the structure. Upon the principle of a broad base and accumulation of matter, the whole, to the height of 35 feet from the foundation, is a solid

mass of stones engrafted into each other, and united by every kind of additional strength. The light-house has four rooms, one over another, and at the top a gallery and lantern. The stone floors are flat above, but concave below, and are kept from pressing against the sides of the building by a chain let into the walls. The light-house is nearly 80 feet high, and withstands the most violent storms, without sustaining the smallest injury. It has now stood above 39 years, during which time it has been often assaulted by all the fury of the elements: And, in all probability, as Mr. Smeaton said, nothing but an earthquake can destroy it. The wooden part of it, however, was burnt in 1770, but renewed in 1774. Lon. 4. 21. W. Lat. 50. 3. N.

EDEN, [עֵדֶן, Heb. *i. e.* pleasure,] a country, with a garden, in which the progenitors of mankind were settled by God himself. It would be endless to recount the various conjectures as to its situation, some of which are very wild and extravagant. Moses says, that "a river went out of Eden to water the garden, and from thence it was parted and became into four heads." This river is supposed to be the common channel of the Euphrates and Tigris, after their confluence; which parted again, below the garden, into two different channels: so that the two channels before, and the other two after their confluence, constitute the heads mentioned by Moses. This will determine the situation of the garden to have been in the S. of Mesopotamia, or in Babylonia. The garden was also called *Paradise*; a term of Peric original, denoting a garden.

EDEN, a river of England, in Westmoreland.

EDEN, a river of Scotland, in Berwickshire, and another in Fifeshire.

EDEN, a town of Germany, in Westphalia.

EDENTON, a district on the sea-coast of North Carolina.

EDENTON, the capital of the above district, 97 miles N. of Newbern. Lon. 77. 11. W. Lat. 36. 6. N.

EDESSA, a town of European Turkey, in Macedonia, 44 miles W. N. W. of Salonichi.

EDGAR, the son of Edmund I, one of the most fortunate of the Anglo-Saxon monarchs. He succeeded his brother Edwy, A. D. 959; and is said to have been rowed down the Dee by eight kings his vassals. He died in 975.

EDGARTON, a town of Massachusetts, capital of Duke's county, situated on the east side of the island of Martha's Vineyard.

EDGCOMB, a county of Halifax district, N. Carolina.

EDGEFIELD, a town and county of South Carolina, the southernmost in the district of Ninety-Six.

EDGEWARE, a town in Middlesex, 8 miles N. W. of London.

EDGHIR, a town of Hindostan, in Golconda, 75 miles S. W. of Hydrabad.

EDGINGS, in gardening, the series of small but durable plants, set round the edges or borders of flower-beds, &c. The best and most durable of all plants for this use, is *box*; which, if well planted, and rightly managed, will continue in strength and beauty for many years. The seasons for planting this, are the autumn, and very early in the spring: and the best species for this purpose is the dwarf Dutch box.

EDICT, [*edictum*, Lat.] a proclamation of command or prohibition; a law promulgated. An edict is an order or instrument, signed and sealed by a prince, to serve as a law to his subjects. We find frequent mention of the edicts of the prætor, in the Roman law. In the late French law, the edicts were of several kinds; some importing new laws or regulations; others, the erection of new offices; establishments of duties, rents, &c. and sometimes articles of pacification. In despotic governments, an edict is much the same as a proclamation is with us: but with this difference, that the former has the authority of a law from the power which issues it; whereas the latter is only a declaration of a law, to which it refers, and has no power in itself.

EDILE. See *EDILE*. This ancient title was resumed in the late constitution of the Roman republic.

EDINBURGH, the metropolis of Scotland, is situated in the county of Mid-Lothian, about a mile S. from the Frith of Forth. Lon. 3. 0. W. Lat. 56. 0. N. The old town is built upon a steep hill, rising from E. to W. and terminating in a high and inaccessible rock, upon which the castle stands. At the E. end or lower extremity of this hill stands the abbey of Holyrood house, the ancient

cient royal palace, distant from the castle upwards of a mile; and betwixt which along the top of the ridge, and almost in a straight line, runs the high street. The castle stands on a high rock, accessible only on the E. side. On all others it is very steep, and in some places perpendicular. It is about 300 feet high from its base: so that before the invention of artillery, it might have well been deemed impregnable; though the event shewed that it was not. The entry to this fortress is defended by an outer barrier of palisadoes; within this is a dry ditch, draw-bridge, and gate, defended by two batteries which flank it; and the whole is commanded by a half-moon mounted with cannon, carrying balls of 12 pounds. The churches, both presbyterian and episcopal, are very numerous; as are also other places of worship of various denominations. The New Town was projected in 1752; but as the magistrates could not then procure an extension of the royalty, the execution of the design was suspended for some time. In 1767, an act was obtained, by which the royalty was extended over the fields to the N. of the city; upon which advertisements were published by the magistrates, desiring proper plans to be given in. Plans were given in accordingly, and that designed by Mr. James Craig, architect, was adopted. Immediately afterwards, people were invited to purchase lots from the town council; and such as purchased became bound to conform to the rules of the plan. The elegance of the buildings, the fineness of the situation, and the regularity of the plan of the New Town have rendered it extremely agreeable and beautiful. The number of inhabitants is upwards of 80,000. In 1581, a grant was obtained from K. James VI. for founding a college or university within the city of Edinburgh; and the citizens, aided by various donations, purchased a situation for it, consisting of part of the areas, chambers, and church of the collegiate provostry and prebends of the Kirk-a-field, otherwise called Templum et Præfectura Sanctæ Mariæ in Campis, lying on the S. side of the city. Next year, a charter of confirmation and erection was obtained, from which the college afterwards derived all the privileges of an university. For several years the college consisted only of the principal and 4 regents or professors of philosophy. Each of these regents instructed one class of students for 4 years, in Latin, Greek, logic, mathematics, ethics, and physics, and graduated them at the conclusion of the 4th course. A professor of Latin was afterwards appointed, who prepared the students for entering under the tuition of the regents; also professors of mathematics, and another of Hebrew. It was not till about 1710 that the 4 regents began to be confined each to a particular profession; since which time they have been commonly styled Professors of Greek, Logic, Moral Philosophy, and Natural Philosophy. The first medical professors instituted at Edinburgh,

were Sir Robert Sibbald and Dr. Archibald Pitcairn, in 1685. Such was the flourishing state of this university, that it became necessary to erect a new college, which is a complete and commodious edifice. The university is celebrated throughout the world; and its medical school, in particular, is entitled to the first rank.

EDITOR, [*editor*, Latin,] he that revises or prepares any work for publication.

EDLAND, LAKE, or SLAVE LAKE, a lake of N. America, N. of the lake of Arapescow, near the Arctic Circle.

EDMONDSBURY, ST. See BURY.

EDMUND I, king of England, the son of Edward the Elder, succeeded his brother Athelstan, A. D. 941, and exhibited proofs of great courage and abilities during a short reign of about 8 years. He was murdered by Leolf, a robber, A. D. 948.

EDMUND II, surnamed IRONSIDE, from his strength and valour, succeeded his father Ethelred II. A. D. 1016, in that part of England which was not then possessed by the Danes. He was endowed with great abilities, but was murdered by the traitor, Edric, D. of Mercia, before he had reigned a year.

EDOM, [עֲדָם, Heb. *i. e. red*,] or ESAU, the son of Isaac and brother of Jacob. The name, Edom, was given him, either because he sold his birth-right to Jacob for a mess of red pottage, or by reason of the colour of his hair and complexion. Idumæa is derived from Edom, and is often called in scripture the land of Edom.

EDOM, or IDUMÆA, in ancient geography, a district of Arabia Petraea. A great part of the S. of Judea was also called Idumæa, because occupied by the Idumæans, upon the Jewish captivity, quite to Hebron. But the proper Edom or Idumæa appears not to have been very extensive, from the march of the Israelites, in which they compassed it on the S. eastwards, till they came to the country of the Moabites.

EDROM, anciently ETHERHAM, a parish of Scotland in Berwickshire, about 10 miles long and 6 broad. The surface is generally flat, the climate healthy, and the soil mostly fertile, though part of it is moorish and barren, or clayey. The population in 1790, stated by the Rev. William Redpath, in his report to Sir J. Sinclair, was 1336. He does not mention the population in 1755. The number of horses was 280, of sheep 3000, and of black cattle 600. There are a paper mill, a lint mill, and a wheel manufacture in the parish: which employ 66 people. Husbandry is much improved, and the greater part of the ground is inclosed.

EDSAN, a river of Russia, a branch of the Lena, 20 miles S. E. of Zigansk.

EDUCATION,

Is the art of rearing, forming, and instructing, of children, according to the most appropriate rules and maxims. Its grand object is the gradual improvement and regulation of our moral, physical, and intellectual faculties. Education affords that series of means, by which the human understanding is gradually enlightened, and the dispositions of the human heart are formed and called forth to the performance of their proper action. The word Education, among the ancients seems to have had a signification different from that which is affixed to it by the moderns. *Educit obstetrix*, says Varro, *educat nutrix*, *instituit pædagogus*, *docet magister*. According to this distinction, education, institution, and instruction, are as different, as the midwife, the nurse, the preceptor, and the master. But these verbal distinctions are now laid aside. As no subject is of more importance than education; being in a manner, the foundation, when properly considered, of all science, as well as of all virtue; so many eminent authors, both ancient and modern, have wrote upon it. Lycurgus and many others of the most eminent legislators of antiquity, considered a proper education as so necessary to form good citizens, that they

incorporated their systems of education, with the codes of laws they gave to their countrymen. But among all the legislators and authors of antiquity, of whose works any relics have come down to us, none appears to have written with more propriety on this subject, than the celebrated QUINTILIAN; who taught rhetoric in Rome under Domitian, Nerva, and Trajan. Experience and observation have fully evinced, that the future conduct and happiness of a child depend in many respects principally on his education; hence the necessity of attending to that maxim of heavenly origin, *Train up a child in the way he should go; and when he is old, he will not depart from it*.

The limits of our plan will not permit us to expatiate on this important and useful article, and therefore it will be necessary to confine ourselves to a few general observations, and for further information, to refer to the treatises, which have been written on this subject. We shall make some selections from Dr. Chapman's excellent treatise on education.

"MAN is eminently distinguished among the inhabitants of this globe. He derives this distinction from the structure and aspect

even of his body, and still more from the powers and affections of his mind. The mind indeed seems to have but few ideas at first, and even to be indebted for these to external objects. But the noble and extensive powers, with which it is endued, discover themselves by degrees, and render it highly susceptible of improvement. This improvement is closely connected with the perfection and happiness of mankind: if the mind be darkened by error, and corrupted by vice, we shall be miserable, as well as mean; if it be enlightened by knowledge, and formed to virtue, we shall more easily support the natural evils of life, and we shall open to ourselves the truest and the largest sources of happiness. Hence it appears, that of all the objects which can attract our attention, there is none so interesting as the mind itself. And hence it is, that those who have the charge of youth ought, in a particular manner, to study the nature of the human mind. They should trace it in all its different appearances, and observe it, with a still more curious and attentive eye, in the first and most incorrupted season of life. They should attend to its gradual openings; they should assist it in its exertions, and supply it with proper materials of knowledge. Beginning with the natural objects with which a child is surrounded, they should teach him how to discover their more obvious and useful qualities; then they should point out the changes made upon them by human industry, and the purposes for which such changes are made. Discoveries of this kind, and explanations as the children advance in age, and as the objects present themselves to their notice, will excite their curiosity, and instruct as well as employ their minds. This will be a proper foundation for the languages, the arts, the sciences. The acquisition of knowledge should be made, as much as possible, the fruit of their own inquiries, and of the unconstrained exertions of their mental powers. Thus they will learn to exercise their own understanding in the pursuit of knowledge, rather than trust, upon all occasions, in a lazy and implicit manner, to the opinions of their parents and teachers. Parents and teachers are surely intitled to the highest respect, as well as obedience, from children; but they should take the most effectual measures to secure this respect; they should take the simplest and most probable methods of cherishing those seeds of knowledge which seem more or less to be lodged in the minds of children, and require only proper culture to rear them. Far from pushing children forward in a precipitate manner, by loading their memories with unexplained words, or by requiring from them tasks above their comprehension, or of little utility in life, they should keep pace with their rising genius, by adapting their instructions to their confined ideas, and respective capacities, by explaining every word till it be fully understood, and by teaching with greater care those things which are afterwards to be most useful to them. Further, as education is known to have a powerful influence in forming the tempers and characters of men, parents and teachers should endeavour, as soon as children are capable of comprehending the social ties, to cherish, with the utmost vigilance, that benevolence which is the bond of society, to strengthen that sense of right and wrong which makes a distinguished part of the human constitution, and to prevent those false associations of ideas which are destructive of happiness, and which, children inexperienced in life, and deluded by appearances, are apt to form. Above all, they should study to inspire them with sentiments of duty and gratitude to the Supreme Being, considered as their parent, benefactor, and judge; and to enforce, by a prudent discipline, all those principles which have a tendency to make them happy in themselves, and useful to others. "While they are thus employed in cultivating the mind, the body is by no means to be neglected. Its influence over the mind is as great as its union with it is surprising. The body, when softened by indolence, or by mistaken tenderness, enfeebles the mind, relaxes its vigour, and unfits it for every great or difficult undertaking; when pampered and weakened by luxury, or the gratification of irregular appetite, it subjects the mind to wants not its own, and excites those passions which are the enemies of happiness and of life; but when it is nourished by temperance, and hardened by exercise, it enables the mind to exert its native strength, inspires it with cheerfulness, kindles up the benevolent affections, sets virtue in the most amiable light; and shews it to be the truest happiness of man. If we consider the simplicity of children, and study carefully to preserve them from prejudice, we shall find them open to the best impressions, and delighted with every step they

advance in the road to knowledge and to virtue. This encourages parents and tutors to cultivate the minds of children with the utmost attention; and renders them inexcusable, if they suffer the noxious weeds of folly and vice to spring up in a soil so valuable, and so capable of improvement. This attention, as has been already observed, should begin with the earliest period of life. Weak and flexible, while destitute of experience, and unimproved by reflection, children are ready to adopt the sentiments and copy the manners of those on whom they depend. This propensity to imitation, together with the contagion of example, may hurry them into a blind compliance with the vices and follies of others, and thereby expose them to all the inconveniences of error in judgement and in practice. At the same time, this very propensity, if properly directed, will act like a powerful engine in favour of virtue. From such reflections as these, we may see the dignity of the human mind, the importance of education, the manner in which we ought to conduct it at first, the great objects we ought always to have in view, the necessity of taking care of the body as well as the soul, and the encouragement we have to turn our attention to this subject from the innocence and the docility of children. Hence too parents may learn, that if they neglect the education of their children, the riches which they may accumulate, and the splendid or lucrative employments, which they may procure for them, will but increase their misery. And hence teachers may see the principles which they ought to inculcate, and the nature of the duties incumbent on them, or rather of the high privilege conferred upon them. What occupation is there on earth more useful to mankind, or more delightful in itself, than to improve the mind of man? And what more probable means of succeeding in so noble an attempt, than to superintend it in the first exertions of its faculties, and preserve it, through the critical season of youth, in that healthful state in which its happiness consists. The foregoing observations are sufficiently confirmed by the experience of the ancients as well as the moderns. History, that mirror of human life, exhibits to our view the fortune of mankind ever varying in proportion to their care or negligence in the education of youth. Where this was attended to, and properly conducted, we see, that not only individuals, but even societies, were virtuous and happy: where this was neglected, or the method of conducting it mistaken, we see likewise, that they plunged themselves into vice; and felt, at length, its direful and unavoidable effects. The errors which are frequently committed in education by parents, and those to whom they transfer the care of their children, may be reckoned one great source of human misery. A few instances will confirm the truth of this observation. The manifold accidents to which we are continually exposed, the opposite views and different tempers of mankind, and the precarious hold we have of whatever is external, require that the mind should be formed, by an early and prudent culture, to bear with fortitude and self-command, the various troubles and misfortunes to which we may be subjected. Notwithstanding this, it is no uncommon thing, to see those children whose tempers are warm, and who are susceptible of the finest feelings, frequently neglected in this important point. Instead of teaching them patiently to endure pain and disappointment, and the other evils of life, which cannot be altogether avoided; instead of teaching them to govern their passions, and direct them to proper objects, their parents are often blind enough to allow them to contract an impatience under misfortune, and an impetuosity of spirit when thwarted, both which, gathering strength from indulgence, are often productive of trouble to others, and of misery to themselves. To sources of this kind may be traced many of those outrages which disturb the peace of society, and blast the enjoyment of life. Instead of being taught candidly to acknowledge his faults, the child is suffered to make excuses for them; and sometimes, by a direct lie, to disown them. Thus the sacred regard which is due to truth is gradually diminished, and that fence being broken down, dissimulation, the bane of virtue, establishes an early and a powerful empire in the human heart. Is the child sluggish or refractory? it is thought proper to engage him to his duty by a bribe. Thus, instead of disinterestedness, and the love of virtue, he contracts a sordid and mercenary turn, and a strong attachment to money, which he considers as the great object that interests the passions of men, and the spring by which they ought to be moved: and the high encomiums on it which he so frequently hears, the

passion

passion for it which he observes in the generality of mankind, and the respect which he sees paid to the rich, independent of their virtues, naturally tend to pervert his taste, and teach him to associate the ideas of merit, and of happiness, with the possession of riches. If he gets money from his relations or friends, which they design, through a fond but mistaken affection, as an expression of their regard or esteem, he is often permitted, or rather encouraged, to throw it away in purchasing those things which will sow the seeds of luxury and profusion in his tender mind. Hence that unhappy keenness for toys, fruits, sweet-meats, &c. which we observe in youth, and which, like other infirmities, is nourished by indiscreet and early indulgence; and hence may be derived that desire of superfluities, and those numerous artificial wants, with which a vitiated appetite, or depraved taste, punishes those who depart from the simplicity of nature. Thus we are so far from cultivating a principle of virtue in children during this early period, that we cannot fail, by so unwary a conduct, to ingraft vice in their tender breasts. Hence it is that teachers find it so difficult a task, to root out of their unfortunate pupils those false notions which they have already formed, and to train them up, by virtuous habits, to be good men and useful members of society. When the child arrives at 6 or 7 years, and begins now to multiply his amusements, and to extend his acquaintance, seldom is sufficient care taken to regulate his diversions, and make them subservient to the improvement of his mind, or the health of his body. Is attention given in proportion to the flexibility of his temper, or his want of experience, to shew him the difference of character among the living as well as the dead; to guard him against the infectious example of any idle or naughty children, with whom he may have occasion to converse; and to encourage an intimacy between him and those who are diligent, modest, and virtuous? Is he taught with proper care, to strive with his equals in the noble contest of making himself wiser and better than they? Is he taught, at the same time, to suppress the first risings of envy, that enemy of human happiness, and so resist the emotions of pride and vanity, those silly and selfish passions which are so apt to steal into the unguarded breasts of youth, and especially those of the brightest genius? Is he taught, likewise, to love his companions, to sympathize with them under sickness or unfortunate accidents; to look upon all mankind as his brethren, children of the same common parent; and to consider those to whom he is superior in understanding, or in any of the advantages of fortune, as intitled, upon all occasions, to his advice and assistance? The Author of nature, who confers his gifts with a liberal hand, and adapts them with a parental foresight to the various exigencies of mankind, often bestows a particular genius upon particular persons, and seems by this wise provision, to have marked out the walk of life for which they were designed. Notwithstanding this innate and useful bias, it seldom happens that either the parents or the instructors of a child apply their sagacity to discover the bent of his genius, or direct his studies with a view to render it most valuable to himself, and most beneficial to society. But if his genius be not particular, it would be proper as he advances through youth, and before he chuses his employment, to give him a just view of the advantages and disadvantages, which attend the different occupations of mankind, and to point out to him how far any trade or profession, which he may have in view, is useful to society, and how far it may be suited to his capacity, his temper, and his constitution. Though such considerations as these ought to have great weight in determining his choice, yet seldom is such attention given to direct him, as the importance of that critical step, and the need he has of advice, seem to require. Inexperienced in life, and ignorant of what qualities are necessary in different occupations, he is by no means a proper judge for himself: uninstructed by his parents or teachers, he is too ready to determine himself by the taste of his companions, or by the little incidents which may happen to strike his fancy in the place where he receives his education. In this critical period he is seldom instructed, with proper care, in the use of his time and his money; or taught to spend the former as becomes a rational creature, to divest the latter of the false value stamped upon it by the prejudices of mankind, and to view it in the true light in which it ought to be viewed. To acquire those accomplishments and those habits, when young, which will render us useful in life; to provide for ourselves when of age, and for our families, that they may not be burdens

to society; to give our children a virtuous education; to relieve the indigent, to encourage modest merit, to promote honest industry and public spirit among men, and in general, to do good to our fellow-creatures, are the great purposes to which our time and our money should be applied. We may observe too, that he is not sufficiently taught to look upon industry in his future employment and upon a faithful performance of the duties of his station, as a debt which he owes to the public; nor is he instructed to value men by the decency and propriety with which they acquit themselves in society, rather than by the rank they hold. He ought among other things, to be taught that, if an employment be useful, however humble, it is never to be treated with ridicule or contempt; and can never be so mean, as to preclude the person who industriously and honestly follows it, from the protection and good opinion of mankind." Of all animals, man comes into the world in the most feeble and helpless condition. No other animal, therefore, requires such early, constant, and long continued attention as he does. In this early period of his existence, he is much more an object of care and management than of education. However, it is to be observed, that as "the influence of his body over his mind is great, every plan of education ought to provide for the health of the former, as well as the soundness of the latter." The dress of children, but especially of infants should be light, thin, and easy. The practice of binding up their limbs in swaddling clothes is happily exploded. It is indeed astonishing, that it should ever have been adopted, and still more, that it should have so long, and so generally prevailed. "With us," says the Count de Buffon, "an infant no sooner leaves the womb of its mother, and has hardly enjoyed the liberty of moving and stretching its limbs, than it is clapped again into confinement. It is swathed, its head fixed; its legs stretched out at full length, and its arms placed straight down by the side of its body. In this manner it is bound tight with cloths and bandages, so that it cannot stir a limb," &c. But these barbarous exertions of anxious, but ill-directed care, are now nearly, if not totally abolished. They were kindly intended to prevent deformities, but they operated only to torture the child, and to produce them. The clothes of children should be made so loose and wide, as to leave them the full and free use of all their limbs, without obstructing the circulation of the blood by ligaments of any kind. The dress recommended by Dr. Chapman is "A thin night-cap, a flannel waistcoat without sleeves, a petticoat and gown of light stuff; a thin flannel shirt for the night," and "no shoes or stockings till they are able to run abroad." If too warm clothes are hurtful to children, the custom of sitting near a fire and of sleeping in warm rooms is still more so. Such habits tend to relax the muscular strength of the body, and even in some degree to enfeeble and enervate the powers of the mind. The mother who has milk and strength to nurse her child, and yet gives it up to the care of a mercenary nurse, acts an unfeeling and unnatural part: but she who carries her maternal affection to excess, though she acts from a better principle, deviates no less from the paths of nature. When she makes an idol of her child; increases its weakness, by preventing its sense of it; and, as if she could emancipate him from the laws of nature, prevents every approach of pain or distress; without thinking, that, for the sake of preserving him at present from a few trifling inconveniences, she is accumulating on his head a distant load of anxieties and misfortunes; without thinking that it is a barbarous caution to enervate and indulge the child at the expence of the man. Thetis, says the fable, to render her son Achilles invulnerable, plunged him into the waters of Styx. This is an expressive allegory. The over fond mothers act directly contrary: by plunging their children in softness and effeminacy, they render them more tender and vulnerable; they lay open, as it were, their nerves to every species of afflicting sensations, to which they will certainly fall a prey as they grow up. The course of nature is quite different. She continually exercises her children, and fortifies their constitutions by inuring them early to grief and pain. In cutting their teeth they experience the fever; griping colics throw them into convulsions; the hooping-cough suffocates, and worms torment them; and their blood, by throwing off various purulent matters, subjects them to dangerous cutaneous eruptions. Almost the whole period of childhood is sickness and danger, half the children, that are born, dying before they are eight years old. In passing through this course of experiments, the child who survives them, gathers strength

strength and fortitude, and, as soon as he is capable of enjoying life, the principles of life become less precarious. Experience shews, that children delicately educated die in a greater proportion than others. Provided they are not allowed to exert themselves beyond their powers, less risque is run by exercising, than indulging them in ease. Inure them therefore by degrees to those inconveniencies they must one day suffer. Harden their bodies to the intemperance of the seasons, climates, and elements; to hunger, thirst, and fatigue; in a word, dip them in the Stygian flood. Before the body has acquired a settled habit, we may give it any we please without danger; but when it is once arrived to its full growth and consistence, every alteration is hazardous. A child will bear those vicissitudes which to a man would be insupportable. The soft and pliant fibres of the former readily yield to impression; those of the latter are more rigid, and are reduced only by violence to recede from the forms they have assumed. We must therefore bring up a child robust and hearty, without endangering either its life or health; and though even some risk were run in this respect, it would not afford sufficient cause of hesitation. As soon as a child begins to distinguish objects, a proper choice should be made in those which are presented to it. Every new object is naturally interesting to a child. It finds itself so weak and feeble, that it is fearful of every thing it is not acquainted with. But familiarity, which renders objects uninteresting, destroys this timidity. Children, educated in elegant houses, where cobwebs are carefully swept away, are always afraid of spiders, and retain the same disgust for them as they grow up. What peasant, either man or woman, was ever afraid of a spider? In this view, the education of a child evidently begins before it can speak or understand, since even the choice of objects, presented to its view, is sufficient to render it either timid or courageous. They should be habituated then to new objects, to ugly, disgusting, and uncommon animals; beginning with them, however, at a distance, and letting them approach by degrees; or till, being used to see others handle them themselves. If a child, during his infancy, has been used to regard toads, serpents, or crayfish, with indifference, he will look without horror, as he grows up, on any animal whatever. When a child begins to talk, it weeps less. This progression is natural; one language being only substituted for another. As soon as he can complain in express terms, why should he do it by tears? If a child be of a delicate constitution, extremely susceptible, and naturally apt to cry for nothing, we should dry up the source of his tears, by rendering them fruitless. So long as he continues crying, no one ought to go near him; but run to him immediately on his becoming silent. His manner of calling us to his assistance would be then by his silence, or, at most, by giving only one cry. It is from the perceptible effect of signs, that children judge of their meaning; they see no other relation between them. Whatever mischief a child may have done to itself, it is very rare for it to cry; when alone, at least if it has no hopes of being heard. If a child get a fall, a bump on his forehead, make his nose bleed, or cut his fingers; instead of running to him with an air of apprehension, we should remain quite still, at least for some time. The mischief is done, and there is a necessity for his bearing the pain of it; our over-solicitude would only serve to frighten him the more, and increase his sensibility. In fact, it is less the pain than the fright, which affects children on these occasions. We should spare him, at least, the anxiety of the latter; for he will certainly judge of his misfortune in a great degree as we do. If he sees us alarmed, run eagerly to his relief, console and pity him, he will think himself undone: but if he see us apparently indifferent, and make light of it, he will soon make as light of it himself, and think himself cured as soon as the smart is over. It is at this age children acquire their first principles of courage; and by being inured to slight inconveniencies, learn by degrees to support greater. Indeed, so far from being anxious to prevent a child from cutting or hurting himself, it is better that this should sometimes happen; and that he should not grow up without feeling pain. The first thing we ought to learn, and that which is of the greatest consequence for us to know, is to suffer. It seems as if children were formed little and feeble only to learn this important lesson without danger. If they fall down, or run against any thing, they neither break a leg nor an arm: if they wound themselves with any sharp instrument, the wound is hardly ever fatal, or very deep. We know, in

short, scarcely any instance of a child, when left at liberty, having killed, maimed, or done itself any considerable damage; unless, indeed, where it has been imprudently exposed to tumble down from some high place, to fall into the fire, or water, or within the reach of some deadly weapon. Instead, therefore, of keeping him in the close air of his nursery, he should be taken out every day into the open fields. There he might run and play about; and if he tumbles a hundred times a day, so much the better; he will the sooner learn, when down, to get up again. The pleasure of being at liberty will be a sufficient recompence for his falls. As the child advances in years and understanding, it is of the utmost consequence to inculcate such principles of religion, and consequently of morality as are suited to his years and capacity. "The first and most obvious lesson of morality," says Dr. Chapman, is, 'Not to do ill; not to give pain to another.' This is a lesson which cannot be too frequently inculcated upon children. This is the safest rule for their conduct, and the surest test of their virtue. To this the precept of doing good is but subordinate. The aversion from doing ill, when once rooted in the mind, will accustom children to exercise the understanding in distinguishing between right and wrong; it will check the violence of their passions; it will teach them, if not the most shining, yet the most useful virtues in life; good nature, justice, and prudence." In order that a child may learn this lesson effectually and to good purpose, it is necessary to explain to him in a familiar manner and by some easy comparison, or simile within the compass of his comprehension, that God is his heavenly father, that by him he is preserved in the use and exercise of his powers of body and mind, that it is God his heavenly father who supplies his earthly parents with food, raiment, &c. for his support and convenience. He should then be taught that the highest reverence is due to his heavenly father, as is also his utmost love. He should then be informed that as long as he is obedient to his heavenly father he will find delight and pleasure, but on the contrary when he offends God he will be sure to suffer for it. The child being thus instructed, a foundation will be laid, for inculcating not only the above moral lesson, but many others of a similar nature with their opposites. It may now be observed to him how exceedingly displeasing it is to God for any of his creatures to do ill, or to give pain to another, and by this means an abhorrence of this immorality will be fixed in his breast. Children are so susceptible of instructions, that there is no doubt but their efforts to put in practice what has been communicated will soon be perceived, and perhaps they may sometimes be observed to fail in the performance of their duty; here the parent or instructor has an opportunity to give them another most useful lesson. Here he may unfold to his opening reason the natural depravity and wickedness of the human mind, and letting alone all abstruse reasonings on the subject the proof of it is to be given on the authority of the sacred scriptures, and the observations and experience of good men. He is further to be shewn that he originally brought himself into this state by wilfully doing what was wrong, or forbidden by the Creator, and that in consequence of his crime man was become incapable of doing any thing that is good, and that had it not been for the love and mercy of God in giving a Saviour to redeem man, he must have been miserable and wretched for ever. He may now easily be made sensible that the power of keeping from the commission of evil, and of performing what is right comes from God, and also that God will give, and delights to give this power to all who ask it in the name of Jesus Christ, and that therefore it is necessary thus to ask his grace and to use it, in order that we may be the partakers of real happiness. Lest any should say that these instructions are too difficult for children or not sufficiently important, we shall observe that they are not so difficult as some may imagine. The beauty of our religion is, that it is plain and easy to be understood, especially by those whose minds are not prejudiced by a train of vices, or evil reasonings, and therefore these obvious, essential, and simple, principles of Christianity are fit to be presented to the minds of children. It is also necessary, whenever reason begins to dawn, that these divine precepts be taught on account of their importance. This will be evident to every one who will suffer reason to speak: reason in conjunction with the sacred oracles informs us that to do the will of God, to have a dependence upon him, and to proceed according to his directions, must be the same as to do that which will please him, and that because our happiness or misery entirely depends on his being

pleased, or displeased with us, on his approbation, hence then nothing can be of such importance as these instructions which shew our obligations to the Deity, and the way to please him. Hence it is clear that these subjects cannot be too soon and too carefully impressed on the minds of children, provided the instruction be conveyed in terms and by examples &c. suited to their years and understanding. We find in general that children are ingenious, and ready to believe whatever is told them, they do not naturally seem to manifest a suspicious temper. And on this account we cannot help taking notice of a very general error—(or rather we may say crime,) committed in the education of most children, by mothers, grand-mothers, nurses, servants, and almost all others about them, who, upon every trivial occasion impose upon their ingenious credulity, by telling them the most gross and palpable falsehoods. There is not indeed a more common, or perhaps a more dangerous blunder than this, in the management and education of children. It is attended with various bad consequences. It undermines the first principles of virtue. The child, as soon as it begins to exercise its idea, upon the objects around it, finds it has been told many falsehoods. Hence it begins to suspect falsehood in every thing, and the lessons it afterwards receives from its parents and teachers against lying come rather too late. Besides how cruel it is to impose upon this ingenious readiness of children to believe whatever they are told, by telling them falsehoods from their very birth upwards? It is thus that we teach them falsehood and deceit, and then blame them when we find them afterwards attempting to deceive us. Upon the subject of expressive indulgence we have to observe that when a child evidences a strong desire for any thing, we ought to judge immediately of the propriety of complying with, or refusing it. When a refusal is once given it ought to be absolute and irrevocable. On this head the sentiments of M. Rousseau, contain some very just observations. "But, above all (says he) beware of teaching your child the ceremonious jargon of politeness, a set of phrases which he employs, like magic syllables, to subject to his pleasure every one that comes near him, and to obtain upon demand whatever he desires. In the mode of education adopted by the rich, their children never fail of being rendered politely imperious, by being instructed to make use of such expressions as nobody chooses to resist. Neither in voice nor manner have they any thing suppliant about them: on the contrary, they are as arrogant, if not more so, in their requests, than in their commands, inasmuch as they are always more certain of being obeyed. One sees immediately, that their, If you please, means, It is I please; and that their, pray, stands for do. Admirable politeness this, which teaches them only to pervert the meaning of words, and not to be able to speak otherwise than with the air of command! Surely it is a less evil that a child should prove clownish than insolent, and we had much rather hear him say in a suppliant tone, Do so or so, than make use of a dictatorial Pray, if you please. It is not the words he makes use of that are of so much consequence, but the acceptance he annexes to them. Excessive severity, as well as excessive indulgence, should be equally avoided. If you leave children to suffer, you expose their health, endanger their lives, and make them actually miserable; on the other hand, if you are too anxious to prevent their being sensible of any kind of pain and inconvenience, you only pave their way to feel much greater; you enervate their constitutions, make them tender and effeminate; in a word, you remove them out of their situation as men, into which they must hereafter return in spite of all your solicitude. In order not to expose them to the few evils nature would inflict on them, you provide for them many which they would otherwise never have suffered. Would you know the most infallible way to make your child miserable? It is to accustom him to obtain every thing he desires: for, those desires still increasing from the facility of gratification, your incapacity to satisfy them must sooner or later reduce you to the necessity of a refusal; and that refusal, so new and uncommon, will give him more trouble than even the want of that which he desires. From wanting your cane he will proceed to your watch; he will next want the bird that flies in the air, the star that glitters in the firmament; in short, every thing he sees; nothing less than omnipotence would enable you to satisfy it. It is natural to man to regard every thing as his own, which he has in his power. Could we increase with our desires the means of gratifying them, every one would conceive himself the lord over all. The child, therefore, who needs only desire a thing to obtain it, is led naturally

to imagine himself the proprietor of the universe; he looks upon all mankind as his slaves; and when any thing is, at length, refused him, he, who conceives not the impossibility of executing any of his commands, esteems such refusal as an act of rebellion: all the reasons that can be given him at an age incapable of reasoning, appear to him only pretexts. He sees your ill-will through the whole: the sense of an imaginary injustice sours his disposition; he begins to hate every body; and, without ever thinking himself obliged by their complaisance, is enraged at their contradiction. How is it possible that children, thus subject to be made the prey of the most irascible passions, can ever be happy? Their desires, irritated by the facility with which they have usually been gratified, are bent on impossibilities, whilst they meet on every side with nothing but contradictions, obstacles, sufferings, and sorrow. Always grumbling, fractious, and passionate, they pass their time amidst perpetual tears and complaints. How can these be supposed happy in their situation? Imbecility and authority united, generate only folly and misery. But if these notions of tyranny and command make men miserable in their infancy, how much more will they do so as they grow up, when the relations they stand in to others become more numerous and extensive! Accustomed to see every thing give way to their desires, how will they be surprised, in entering on the world, to see every thing resist their will, and to find themselves oppressed by the weight of that universe, which they imagined they could move about at pleasure! However the lawful and reasonable desires of children, being such as are calculated to make them happy, should be readily complied with. And in every thing they demand, the motive which excites them to make such demand, ought constantly to engage our attention, and determine our conduct with regard to the indulging or denying of their request. While the child is preserved from immoderate and improper desires and indulgences the principles of justice and benevolence should be engrafted, the ideas of right and wrong and those of kindness should be instilled with great care into his mind, presenting him with the choicest examples. Particularly by our own conduct, which a child always observes, we should inculcate these principles. They may also be incited to benevolence, by being encouraged to give something, which they possess and esteem, to relieve or accommodate others. But as M. Rousseau justly observes, we ought not to encourage this to be done, "by returning to children immediately whatever they give;" for, this tends only "to render a child liberal in appearance, and covetous in fact;" and can only "teach them the liberality of an usurer, who gives a penny for a pound" in return. No pecuniary rewards ought, therefore, to be given for acts of charity and generosity. The child should rather, on such occasions be led to reflect on the great good he has done to a poor old man or woman, or to a helpless family of infants, who perhaps, but for his generosity, would have had nothing to eat; and when such scenes of distress (as are alas! too common) are properly represented to his feelings, the child may then be asked, whether he has not more satisfaction in thus supplying their necessities out of his pocket-money, than he could have had by laying it out upon the finest fruits, or the nicest dainties which the confectioner's shop could afford. Thus he will be taught, and will soon begin to feel, that the exercise of such virtue is in reality its own reward. In short, we are fully persuaded, that to breed up children in the principles of virtue and morality, they must be taught these principles as early as possible; and that to inure them to the practice through life, they cannot too early begin. While the heart is young and tender, it is susceptible of every fine feeling and of every good impression; which by habit will afterwards take such firm root as never to be afterwards eradicated. But if we wait till the social virtues spring up spontaneously, as M. Rousseau advises, without ever attempting to plant or cultivate them, it is to be feared we may wait in vain, and discover when too late, that the whole soil is over-run with the weeds of self-love;—a principle, which, however necessary, as the chief spring of action and preservation in every individual, requires nevertheless our utmost exertions to keep it within due bounds, without which, indeed, it becomes the origin of every vice, that disgraces human nature. Mr. Pope in his *Essay on Man*, has been at great pains to prove, agreeably to his friend Lord Bolingbroke's opinion, that

"All self-love and social are the same:"

But Zenith and Nadir are not more opposite; the one being the fountain of all that is good, and the other, when not under due restraint,

straint, of all that is evil in human nature. A proper regulation, therefore of self-love ought to be a principal object with parents and teachers in the education of children. Before we conclude this article, it will be proper to take notice of the impropriety and inconvenience of not teaching young people to think and act of themselves. The art of a governor, and the lessons of a preceptor, change a child into a youth; they infuse into him a greater share of knowledge than he could be naturally supposed to have at his age. But this very child, when he arrives to that stage of life in which he must think, speak, and act, of himself, is stripped all of a sudden of his premature merit. His summer is far from answering the fine blossoms of his spring. The too solicitous education he has received, becomes rather prejudicial to him, by reason of its being the occasion of his falling into the dangerous habit of letting other people think for him. His mind has contracted an internal laziness, which makes him wait for external impulses to resolve and to act. The mind contracts a laziness with as much facility as the legs and feet. A man who never stirs without the assistance of some vehicle, becomes soon incapable of the same free use of his legs, as a person that has been constantly accustomed to walk. As therefore, we must lend a hand to the one when he walks, so we must help the other to think, and even to will: whereas a child bred up to the exercise of his own thoughts and reason, naturally brings his powers into exertion, and his mind from being accustomed to labour becomes active. He learns to reason and determine of himself, in the same manner as other things are learned. At length he attains to argue and resolve rightly, by mere dint of reasoning and reflecting on the cause of his deception, when the events convince him of the error of his judgement. It is not our purpose here to enter into a detail of the several particular branches of education and discipline of youth in their different rising years, and according to their different stations in life, and the different views of their parents; neither have we room to expatiate on the proper qualifications and requisites of tutors, governors, &c. or on the peculiar advantages or disadvantages of public schools, and of private or domestic education. For full information on these subjects, we refer to the numerous treatises, which have been written on education, and of which we shall mention a few of the most remarkable. The most excellent author on education, among the ancients, is Quintilian, who, when he gave over teaching rhetoric at Rome, wrote a Treatise on Rhetoric, and on the most proper means for educating a boy, so as to render him both an eloquent orator, and a good man. In that work Quintilian gives a particular detail of all that appears most likely to conduce to those ends. Even from his birth, he would have the greatest care to be used in selecting those who are to be placed about his young orator. The nurse must have no impediment of speech. If his parents be not persons of sense and learning, his tutor, at least, must possess these qualifications. As soon as he can speak distinctly, he must be initiated in the first elements of literature. Even at this early period of life, Quintilian proposes, that maxims of prudence and the first principles of morals should be inculcated upon his mind, by the books which are put into his hands, and by the lines which he copies in learning to write. The Greek language was to the Romans in Quintilian's time, (like the Latin, Greek, and French, to us at present,) indispensably necessary to all who aspired to a liberal education; and Quintilian judged it proper, that the boy should begin his literary course with the Greek, in preference to the Latin language. Quintilian, after examining the question, whether a domestic or a public education is liable to the fewest inconveniences, and likely to be attended with the greatest advantages; gives his decided opinion in favour of the latter, and wishes that parents would place their children in public seminaries of education. This judicious author declares against severe chastisements of children. "According to his temper and dispositions, let the boy be treated with mildness or severity; but never let severity extend to blows. Let the boy be allured and led, by the most artful and insinuating treatment, to do his duty; there will then be no occasion to punish him for neglecting it." Quintilian's professed object being, not merely to give general directions for forming the heart and cultivating the understanding, but to form a particular character in life, the scholar and the orator; he enters into minute details concerning the manner in which the boy is to be instructed in speaking, writing, grammar, and composition. Music and geometry, he advises also to make a part of the young

orator's studies; to render him accurate in reasoning, and capable of relishing the beauties of the poets. With tender attention, this elegant writer accompanies his pupil through the course of his studies; insists that he be placed under a master distinguished for purity of morals, as well as for abilities; advises his memory to be stored with the best passages of the poets, orators, and historians; and refutes the opinions of those who represent genius as above industry. Among the moderns, few names are more justly venerated, than that of John Milton. His life was devoted to study; and part of it was employed in instructing youth. Among his other works we find a Treatise on Education. He had himself been educated according to the plan long established in the English universities. The object of his directions is chiefly to form the scholar, and to exhibit a plan of "a better education, in extent and comprehension far more large, and yet of time far shorter, and of attainment far more certain, than any that had yet been in practice." His treatise contains many useful observations. The name of John Locke is sufficient to excite the attention of every reader to what he has written on the education of youth. He was capable of thinking for himself; but unlike Rousseau, more desirous of rendering himself useful, than of being admired for singularity. Mr. Locke had been conversant with the world, had inquired into the principles of human nature, and had examined without prejudice the effects of those modes of education of which he disapproves. When we consider, that, to render himself useful to mankind, he could descend from the heights of science to the humble task of translating *Æsop's Fables*, which a philosopher of less philanthropy would have disdained; we cannot but look with veneration on so exalted a character. Mr. Locke's two chief objects in his Treatise on Education, are, 1st, To preserve and strengthen the bodily constitution; 2dly, To inform the understanding with useful knowledge, and to cherish good dispositions in the heart. In his directions on the first of these heads, he recommends plain fare, simple and light clothing, with abstinence from physic and strong liquors, as the most judicious means for preserving and confirming the health of children; together with temperance and early rising. In one thing, however, few parents will be willing to comply with Mr. Locke's advice. He not only directs that the child's feet be frequently bathed in cold water; but even wishes that his shoes were always kept in such a condition as to admit water freely. This he thinks likely to fortify the constitution of the body in such a manner, as to render him less liable, in the course of life, to such diseases as arise from any unusual exposure to wetness or cold, than others whose feet have been more carefully kept dry. Mr. Locke entertained so unfavourable an opinion of the effects of medical preparations on the human body, that he insists on the parent to beware of administering any of them to his child. But whatever may be thought of these advices, or of his plan of invigorating the constitution, by exposure to hardships, his method of cultivating the understanding, and forming the dispositions, deservedly claims the attention of parents and preceptors. With a virtuous indignation he reproaches that folly by which we generally corrupt the heart, and spoil the temper of children, in infancy; so as to render them incorrigible when they advance in life. On the other hand he reckons it neither necessary nor prudent to treat them with harshness or severity. Let them be formed to obedience from their earliest years: let them be accustomed to submit implicitly to the direction of those on whom they depend. But beware of souring their tempers, and depressing their spirits by harshness; as well as of accustoming them to neglect their duty, except when allured to it by the hopes of reward. Mr. Locke's treatise is well deserving the perusal of the judicious parent, or teacher; and though a few things may be found in it exceptionable, yet for the most part it will present and furnish rules and observations, not only appropriate, but exceedingly proper for practical application. The Rev. Dr. Isaac Watts, whose numerous works upon philosophy, logic, divinity, &c. are well known, has also a Discourse on the Education of Children and Youth; annexed to his excellent treatise on *The Improvement of the Mind*. It treats of, 1. Instructing children in religion, which the Dr. thinks should be attempted "as soon as they begin to know almost any thing." 2. The improvement of their natural powers: 3. Self-government, which he proposes children to be early instructed in: 4. Reading and writing: 5. An employment: 6. Rules of prudence: 7. Accomplishments in life among which the Dr. enumerates the Greek, Latin, and French

French languages, logic, mathematics, astronomy, natural philosophy, and the fine arts. With regard to the languages, the Dr. reckons "the knowledge of things of much more importance than that of words." 8. Of evil influences, from terrifying stories, bloody histories, &c. 9. Of sports and diversions, amongst which he justly condemns the practice of cock-fighting, as well as plays and masquerades. 10 and 11. His two last sections treat of the proper degrees of liberty and restraint in sons and daughters. From these general heads, this tract evidently appears to be well worthy of the attention of Christian parents. Dr. Turnbull published *Observations on Liberal Education*; at London, in 1742. This work contains the essence of what has been written on the subject by the ancients; with remarks from Mr. Locke and others of the moderns. The author shews the importance of early habits of virtue, and recommends along with the acquisition of the vernacular and learned languages, the study of natural and moral philosophy, and the cultivation of a taste for the beauties of nature, and the still greater beauties of virtue. Dr. Chapman says it "abounds in instructions very useful to parents and children." In 1743, Mr. James Barclay published at Edinburgh a *Treatise on Education*, in 12mo. containing, says Dr. Chapman, "many useful observations on public and private education, the duty of parents and teachers; grammar, history, taste, poetry," &c. In 1756, Mr. James Neidson, apothecary, published *An Essay on the Government of Children*, under three general Heads; Health, Manners, and Education, 12mo. Lond. Dr. Chapman recommends this work as containing "many judicious rules and observations worthy the attention of parents and teachers." In 1762, the celebrated John James Rousseau surprised the public with his *Emilius*; a moral romance in 4 vols. 12mo. In this work there are many things deserving of the severest censure, while other parts are highly commendable in his system, which is theoretical, and often unfit for practice; he fixes the time for commencing certain instruction by far too late. Even Rousseau himself, notwithstanding the art with which he lays down his system, cannot avoid acknowledging indirectly, on several occasions, that our social dispositions, our rational and our moral powers, display themselves at an earlier period, than that at which he wishes us to begin the cultivation of them. But though the great outlines of his system be merely theory, unsupported by facts, nay, plainly contradictory to facts; yet his observations on the impropriety or absurdity of the prevalent modes of education are very often just, and many of the particular directions which he gives for the conducting of education are judicious. Father Gerdil, in his *Reflections on Education*, published in 1765, examines the principles laid down by M. Rousseau in his *Emilius*, and shews in opposition to him, that man is designed for a social state, and improved by it; that children are capable of early instruction, and may be taught fables, geography, history, and geometry; that they may be formed to a taste for true Latinity; and that the lower, as well as the higher rank of life, ought to be trained, by early culture, to the fear of God, obedience to parents, and the fundamental duties of society. Mr. Sheridan, in his *Plan of Education for the young Nobility and Gentry of Great Britain*, published in 1769, censures the methods commonly pursued in the great schools in England, and points out the ends we ought to have in view, and the means and the instruments we ought to use, in the education of youth: the ends are, to make good men, good citizens, and good Christians; the means, a strict attention to their behaviour, and the adapting their studies to their talents, and to their future professions and offices in life; the instruments, a sense of honour, a sense of shame, and, above all, a sense of delight. The learned and pious author of *Letters*, containing a *Plan of Education for Rural Academies*,

published in 1773, complains that education does not engage the attention it merits; represents the country as most favourable to the health, the safety, the morals, and the religious training, of youth; recommends a plain diet, and a plain, but neat dress; prescribes a course of education from 7 to 11 years of age, to consist of the principles of religion, moral tales, the rudiments of Latin, and elements of Greek, with writing and arithmetic; from 11 to 15, he enjoins perseverance in the study of the classics, and of history, with the elements of rhetoric, algebra, and geometry; sends his pupil to the university, if he be designed for any of the learned professions; thinks that the student suffers much from discontinuing his studies during the summer months, and advises him to be sent back to the academy through the summer, to prevent habits of idleness and dissipation, to revise what he had formerly learned, and to prepare for the next course at the university; but, instead of sending him to the university at the age of 15, he detains him at the academy, if he be designed for the service of his country in a civil or military capacity; prescribes a continuation of his former studies, and introduces him to natural history and philosophy; lays down a course of study at the academy for such as are to follow a mercantile employment; proposes a plan for the education of young ladies at a rural academy; and concludes with a plan of education in parochial schools, laid down by Mr. Fletcher of Salton, who made a figure about the beginning of this century. "This author, says Dr. Chapman, insists much on instilling religious and moral principles, and on training the youth of both sexes, by virtuous habits, to the different duties of life." In 1777, Dr. Ash published *Sentiments on Education*, collected from the best authors, with occasional observations: in 2 vols. 12mo. Lond. Vol. i. contains instructions and observations; on teaching to read; grammar; writing; drawing; arithmetic; geometry; geography; astronomy; chronology; music; rhetoric; a course of reading; public speaking; trade and commerce. Vol. 2 treats of female accomplishments; of modesty; the passions; epistolary correspondence; subordination in society; behaviour in social and civil life; love and marriage; management of a family; and religion. The Rev. Mr. Knox, in his *Liberal Education, or Practical Treatise on the Methods of acquiring Useful and Polite Learning*, published in 1781, prefers public education for boys, and domestic, with little exception, for girls; condemns the use of translations, and editions of the classics with notes; insists on industry, and the diligent use of dictionaries in schools; enjoins the rules of Lily's Grammar, and large portions of the best classics to be got by heart, with the writing of exercises, and the composition of themes in English and Latin, and in verse as well as prose, according to the practice of the best schools of England; advises that there be public rehearsals by the elder scholars once every week from the best English and Latin authors, and public examinations at short intervals; insists on a judicious and well supported discipline in schools; and makes many just and ingenious observations on cultivating the minds of both sexes, &c. Dr. Chapman says, Mr. Knox's stile is so accurate and elegant, that it may be said to be truly attic. In 1792, Dr. George Chapman published the fifth edition, improved and enlarged, of his *Treatise on Education*, in two parts. With the Author's *Method of Instruction* while he taught the School of Dumfries; and a *View of other Books on Education*. This work is one of the best and most complete we have on this subject, and is admirably adapted for practice. *Strictures on female education*, by Mrs. A. More, is a work well adapted to give those entrusted with the education of young ladies proper views of this important charge.

EDULCORATION, in chemistry, properly signifies the rendering of substances more mild. It consists almost always in taking away acids and other saline substances; and this is effected by washing the bodies, to which they adhere, in a large quantity of water. The washing of diaphoretic antimony, powder of algaroth, &c. till the water comes off quite pure and insipid, are instances of chemical edulcoration.

VOL. II.—NO. 71.

EDULCORATION, in pharmacy, is merely the sweetening of juleps, potions, and other medicines, by adding sugar or syrup.

EDWARDS, GEORGE, F. R. A. SS. was born at Stratford, a hamlet of Westham in Essex, April 24, 1694. Upon leaving school, he was put apprentice to a tradesman in Fenchurch-street, who treated him with great kindness; but about the middle of his apprenticeship, an accident happened, which led young Edwards

EGAKTO, one of the smaller Kurile islands, in the N. Pacific ocean.

EGENBURG, or EGGENBURG, a town of Germany, in the archduchy of Austria, 36 miles N.W. of Vienna.

EGERI, one of the late grand communities of Switzerland, which, with the town of Zug, formed the Canton of Zug.

EGERIA, or ÆGERIA, a nymph held in great veneration by the Romans. She was courted by Numa Pompilius; and according to Ovid, became his wife. This prince to give his laws the greater authority, solemnly declared, before the Roman people, that they were previously sanctified and approved by the nymph Egeria. Ovid says, that Egeria was so disconsolate at the death of Numa, that she melted into tears and was changed into a fountain by Diana.

EGG, in physiology, a body formed in certain females, in which is contained an embryo, or fœtus of the same species, under a cortical surface or shell. The exterior part of an egg is a shell; which in a hen, for instance, is a white, thin, and friable cortex, including all the other parts. The shell becomes more brittle by being exposed to a dry heat. It is lined every where with a very thin, but a pretty tough membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag, where nothing but air is contained. In new-laid eggs this follicle appears very little, but becomes larger when the egg is kept. Within this are contained the albumen, or white, and the vitellus, or yolk; each of which have their different virtues. The albumen is a cold, viscous, white liquor in the egg, different in consistence in its different parts. It is observed that there are two distinct albumens, each of which is inclosed in its proper membrane. Of these one is very thin and liquid; the other is more dense and viscous, and of a somewhat whiter colour; but in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yolk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new-laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another, and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen; so it is very probable that they are of different natures, and consequently appointed for different purposes. When the vitellus grows warm with incubation, it becomes more humid, and like melting wax or fat; whence it takes up more space. For as the fœtus increases, the albumen insensibly wastes away and condenses; the vitellus, on the contrary, seems to lose little or nothing of its bulk when the fœtus is perfected, and only appears more liquid and humid when the abdomen of the fœtus begins to be formed. The chick in the egg is first nourished by the albumen; and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its centre; consequently, since it is heavier than the white, its smaller portion must always be uppermost in all positions of the egg. The yellowish white round spot, called cicatricula, is placed on the middle of the smaller portion, and therefore always appears on the superior part of the vitellus. Not long before the exclusion of the chick, the whole yolk is taken into its abdomen; and the shell at the obtuse end of the egg, frequently appears cracked some time before the exclusion of the chick. The chick is sometimes observed to perforate the shell with its beak. After exclusion, the yolk is gradually wasted, being conveyed into the small guts by a small duct. Eggs differ very much according to the birds that lay them, as to their colour, form, bigness, age, and the different way of dressing them: those most used in food are hens' eggs; of which such as are new-laid are best. As to the preservation of eggs, it is observed that the egg is always quite full when it is first laid by the hen; but from that time it gradually becomes less and less so, to its decay: and however compact and close its shell may appear, it is nevertheless perforated with a multitude of small holes, though too minute for the discernment of our eyes, the effect of which is a daily decrease of matter within the egg, from the time of its being laid; and the perspiration is much quicker in hot weather than in cold. To preserve eggs fresh, there needs no more than to preserve them full, and stop the transpiration; the method

of which is, by stopping up those pores with matter which is not soluble in watery fluids: and on this principle it is that all kinds of varnish, prepared with spirit of wine, will preserve eggs fresh for a long time, if they are carefully rubbed all over the shell; tallow, mutton fat, and even fresh butter are also good for this purpose; for such as are rubbed over with any of these will keep as long as those coated over with varnish. M. Reaumur observes, that hens eggs are properly a sort of chrysalis of the animal; their germ, after they are impregnated by the cock, containing the young animal alive, and waiting only a due degree of warmth to be hatched, and appear in its proper form. When eggs have been long kept, there is a road found near one of their ends, between the shell and the internal membrane; this is a mark of their being stale, and is the effect of an evaporation of part of their humidity; the varnish which M. Reaumur used to the chrysalis, being tried on eggs, was found to preserve them for two years, as fresh as if laid but the same day, and such as the nicest palate could not distinguish from those that were so.

EGLANTINE, in botany. See ROSA.

EGLISOW, an ancient town of the Helvetic Republic, in the canton of Zurich, 15 miles N. of Zurich.

EGMONT, a town of Batavia or Holland, in the dept. of the Texel, 3 miles S. of Alcaer.

EGOTISM, [from *ego*, Lat.] the fault committed in writing by the frequent repetition of the word *ego* or *I*; too frequent mention of a man's self in writing or conversation.

EGRA, a river and town of Bohemia, 76 miles W. of Prague. Lon. 12. 40. E. Lat. 50. 9. N.

EGREMONT, a town of England, in the county of Cumberland, 9 miles S.S.E. of Whitehaven.

EGYPT, an extensive country of Africa, lying between 30° and 36° of lon. E. and between 21° and 31° of lat. N. It is bounded by the Mediterranean on the N.; by the Red-sea and Isthmus of Suez, which divide it from Arabia, on the E.; by Abyssinia or Ethiopia, on the S.; and by the deserts of Barca and Nubia, on the W.; being 600 miles in length from N. to S. and from 100 to 250 in breadth from E. to W. Ancient Egypt is by some divided into two parts, the Upper and Lower Egypt: by others into three, the Upper Egypt, properly so called, or Thebais; the Middle Egypt, or Heptanomis; and the Lower Egypt, the best part of which was the Delta, or that space encompassed by the branches of the Nile. See THEBAIS, &c. Egypt may with justice lay claim to as high antiquity as any nation in the world. The country was most probably peopled by Mizraim the son of Ham and grandson of Noah. By its ancient inhabitants it was called Chemia, and is still called Chemi in the language of the Copts or native Egyptians. This name it is supposed to have received from Ham the son of Noah. In scripture we find it most generally named Mizraim; though it is styled in the Psalms the land of Ham. To us it is best known by the name of Egypt, the etymology of which is more uncertain. Some derive it from Ægyptus, a supposed king of the country: others say it signifies no more than "the land of the Copts;" *aia* in Greek signifying a country, and *Αἰγυπτος*, *Aicoptos*, being easily hardened into Ægyptus. The most probable opinion, however, seems to be, that it received this name from the blackness of its soil, and the dark colour both of its river and inhabitants: for such a blackish colour is by the Greeks called *ægyptios* from *γυψ* and *Αἰγυπτος* a vulture; and by the Latins, *subvulturius*. For the same reason, other names of a similar import have been given to this country by the Greeks; such as *Aeria*, and *Melambolus*; the river itself was called *Melo* or *Melas*; by the Hebrews, *Shihor*; and by the Ethiopians, *Siris*; all of which signify black. The air and climate of Egypt are extremely hot, not only from the height of the sun, which in summer approaches near to the zenith, but from the want of rain, and from the vicinity of those burning and sandy deserts which lie to the S. In July and August, according to M. Volney, Reaumur's thermometer stands, even in the most temperate apartments, at 24° or 25° above the freezing point; and in the southern parts it is said to rise still higher. Hence, he says, only two seasons should be distinguished in Egypt, the cool and the hot, or spring and summer. The latter continues for the greatest part of the year, viz. from March to November, or even longer; for by the end of February,

February the sun is intolerable to an European at nine o'clock in the morning. During the whole of this season, the air seems to be inflamed, the sky sparkles, and every one sweats profusely, even without the least exercise, and when covered with the lightest dress. This heat is tempered by the inundation of the Nile, the fall of the night dews, and the subsequent evaporation; so that some of the European merchants, as well as the natives, complain of the cold in winter. The dew does not fall regularly throughout the summer, as with us; the parched state of the country not affording a sufficient quantity of vapour for this purpose. It is first observed about June 24th when the river has begun to swell, and consequently a great quantity of water is raised from it by the heat of the sun, which being soon condensed by the cold of the night air, falls down in copious dews. By reason of the great dryness of the air, Egypt is exempted from the phenomena of rain, hail, snow, thunder, and lightning. Earthquakes are also seldom heard of in this country; though sometimes they have been very fatal and destructive, particularly one in 1112. In the Delta, it never rains in summer, and very seldom at any other time. In 1761, however, such a quantity of rain unexpectedly fell, that a great number of houses, built with mud-walls, tumbled entirely down by being soaked with the water, to which they were unaccustomed. In the Higher Egypt the rain is still less frequent; but the people, sensible of the advantages which accrue from it, always rejoice when any falls, however insufficient to answer the purpose. This deficiency of rain is supplied by the inundation and dews. The latter proceed, partly from the waters of the inundation, and partly from the sea. At Alexandria, after sunset, in April, the clothes exposed to the air on the terraces are soaked with them as if it had rained. These dews are more or less copious according to the direction of the wind. They are produced in the greatest quantity by the W. and N. W. which blow from the sea; but the S. and S. E. winds, blowing over the deserts of Africa and Arabia, produce none. According to M. Volney, who gives a very particular description of the face of the country, the entrance into Egypt at Rosetta presents a most delightful prospect, by the perpetual verdure of the palm-trees on each side, the orchards watered by the river, with orange, lemon, and other fruit-trees, which grow there in vast abundance; and the same beautiful appearance is continued all the way to Cairo. As we proceed farther up the river, he says, that nothing can more resemble the appearance of the country than the marshes of the lower Loire, or the plains of Flanders: instead, however, of the numerous trees and country houses of the latter, we must imagine some thin woods of palms and sycamores, with a few villages of mud-walled cottages, built on artificial mounds. All this part of Egypt is very low and flat, the declivity of the river being so gentle, that its waters do not flow at a greater rate than one league in an hour. Throughout the country nothing is to be seen but palm-trees, single or in clumps, which become more rare as you advance; with wretched villages composed of huts with mud walls, and a boundless plain, which at different seasons is an ocean of fresh water, a miry morass, a verdant field, or a dusty desert; and on every side an extensive and foggy horizon, where the eye is wearied and disgusted. At length towards the junction of the two branches of the river, the mountains of Cairo are discovered on the E.; and to the S. W. three detached masses appear, which from their triangular form are known to be the Pyramids. We now enter a valley which turns to the S. between two chains of parallel eminences. That to the E. which extends to the Red Sea, merits the name of a mountain from its steepness and height, as well as that of a desert from its naked and savage appearance. Its name in the Arabic language is Mokattam, or the hewn mountain. The western is nothing but a ridge of rocks covered with sand, which has been very properly termed a natural mound or causeway. In short, that the reader may at once form an idea of this country, let him imagine on one side a narrow sea and rocks; on the other, immense plains of sand; and in the middle, a river, flowing through a valley of 150 leagues in length, and from three to seven wide, which at the distance of 30 leagues from the sea separates into two arms; the branches of which wander over a soil almost free from obstacles, and void of declivity. This country is still divided into two principal parts, called the Higher, or Upper, and Lower Egypt. It is subdivided into 80 provinces.

EGYPT, HIGHER, or UPPER, says M. Savary, is only a long narrow valley beginning at Sienuia, and terminating at Cairo. It is

bounded by two chains of mountains running from N. to S. and taking their rise from the last cataract of the Nile. On reaching the latitude of Cairo they separate to the right and left; the one taking the direction of mount Colzoum, the other terminating in some sand-banks near Alexandria; the former being composed of high and steep rocks, the latter of sandy hillocks over a bed of calcareous stone. Beyond these mountains are deserts bounded by the Red Sea on the east, and on the west by other parts of Africa; having in the middle that long plain which, even where widest, is not more than nine leagues over. Here the Nile is confined in its course betwixt these insuperable barriers, and during the time of its inundation overflows the country all the way to the foot of the mountains; and Mr. Bruce observes, that there is a gradual slope from the bed of the river to those mountains on both sides. The baron de Tott says, that the mountains four leagues from the Nile, and facing Cairo, "are only a ridge of rocks above 40 or 50 feet high, which divide Egypt from the plains of Libya; which ridge accompanies the course of the river, at a greater or less distance, and seems as if only intended to serve as a bank to the general inundation."

EGYPT, LOWER, according to M. Savary, comprehends all the country between Cairo, the Mediterranean, the Isthmus of Suez, and Libya. "This immense plain (says he) presents on the borders of its parching sands a stripe of lands, cultivated along the canals of the river, and in the middle a triangular island to which the Greeks gave the name of Delta; at the top of the angle of which, the Baron de Tott informs us, the rocks of Libya and the coasts of Arabia open and recede from each other, towards the E. and W. parallel to the Mediterranean. This great extent of country, from Barca to Gaza, is either overflowed by the river, or capable of being so; which thus fertilizes in a high degree a tract of country, seemingly devoted to perpetual barrenness, on account of the want of rain and the heat of the climate. According to the testimonies of both Mr. Bruce and M. Volney, the coast of Egypt is so extremely low, that it cannot be discovered at sea till the mariners come within a few leagues of it. In ancient times the sailors pretended to know when they approached this country, by a kind of black mud brought up by their sounding lines from the bottom of the sea; but this notion, though as old as the days of Herodotus, has been discovered to be a mistake by Mr. Bruce; who found the mud to arise while the vessel was opposite to the deserts of Barca. All along the coast of Egypt a strong current sets to the eastward. The river Nile, when swelled by the rains which fall in Abyssinia, begins to rise in Egypt about the month of May; but the increase is inconsiderable till towards the end of June, when it is proclaimed by a public crier through the streets of Cairo. About this time it has usually risen five or six cubits; and when it has risen to sixteen, great rejoicings are made, and the people cry out Waffah Allah, *i. e.* God has given abundance. This commonly takes place about the end of July, or before the 20th of August; and the sooner it takes place, so much the greater are the hopes of a good crop. Sometimes, though rarely, the necessary increase does not take place till later. In 1705, it did not swell to sixteen cubits till the 19th of September, the consequence of which was, that the country was depopulated by famine and pestilence. We may easily imagine, that the Nile cannot overflow the whole country of itself, in such a manner as to render it fertile. There are therefore, innumerable canals cut from it across the country, by which the water is conveyed to distant places, and almost every town and village has one of these canals. In those parts of the country, which the inundation does not reach, and where more water is required than it can furnish, as for the watering of gardens, &c. they have recourse to artificial means for raising it from the river. Formerly they made use of Archimedes's Screw, (see HYDROSTATICS;) but now in place of it they have the Persian wheel. This is a large wheel turned by oxen, having a rope hung with several buckets which fill as it goes round, and empty into a cistern at the top. Where the banks of the river are high, they frequently make a bason in the side of them, near which they fix an upright pole, and another with an axle across the top of that, at one end of which they hang a great stone, and at the other a leathern bucket; this bucket being drawn down into the river by two men, is raised by the descent of the stone, and emptied into a cistern placed at a proper height. This kind of machine is used chiefly in the upper parts of the country, where the raising of water is more difficult than in places near the sea. When any of their gardens or plantations want water, it is conveyed from the cisterns into little trenches,

trenches, and from thence conducted all round the beds in various rills, which the gardener easily stops by raising the mould against them with his foot, and diverts the current another way as he sees occasion. The rise of the inundation is measured by an instrument adapted for the purpose, called mireas, which we translate nilometer. Mr. Bruce informs us, that this is placed between Geeza and Cairo, on the point of an island named Rhoda, about the middle of the river, but somewhat nearer to Geeza. It is a round tower with an apartment, in the middle of which is a cistern neatly lined with marble. The bottom of this cistern reaches to that of the river, and there is a large opening, by which the water has free access to the inside. The rise of the water is indicated by an octagonal column of blue and white marble, on which are marked 20 cubits of 22 inches each. The two lowermost have no subdivisions; but each of the rest is divided into 24 parts called digits; the whole height of the pillar being 36 feet 8 inches. When the river has attained its proper height, all the canals are opened, and the whole country laid under water. During the time of the inundation a certain vortical motion of the waters takes place; but notwithstanding this, the Nile is so easily managed, that many fields lower than the surface of its waters are preserved from injury merely by a dam of moistened earth, not more than eight or ten inches in thickness. This method is used particularly in the Delta when it is threatened with a flood. As the Nile does not always rise to a height sufficient for the purposes of agriculture, the former sovereigns of Egypt were at vast pains to cut proper canals to supply the deficiency. Some of these are still preserved; but great numbers have been rendered useless through the indolence or barbarity of their successors. The arts and all kinds of learning are at a very low ebb among the Egyptians. Even the most simple of the mechanical professions are still in a state of infancy. The work of their cabinet-makers, gunsmiths, and locksmiths, is extremely clumsy. There are manufactures of gunpowder and sugar; but the quality of both is very indifferent. The only thing, in which they can be said to have arrived at any degree of perfection, is the manufacture of silk stuffs; though even these are far less highly finished than those of Europe. In ancient times, when Egypt was governed by its native sovereigns, it is said to have contained 20,000 cities and towns: its armies to have amounted to 300,000 men, and its total population to eight millions. By the tyranny of the Beys and Mamelukes, it now hardly amounts to half that number. The inhabitants of Egypt have been long distinguished, into four distinct races of people, viz. Arabs, Copts, Mamelukes, and Turks. The Arabs may be subdivided into three classes: 1. The posterity of those who settled here immediately after the conquest of the country by Amrou Ebn Al As, the khalif Omar's general. 2. The Magrebiens, or Western Arabs, who at different times have migrated from the countries to the westward of Egypt, and are descended from the Saracen conquerors of Mauritania. 3. The Bedouins, or Arabs of the desert, known to the ancients by the name of Scenites, or dwellers in tents. The Copts are descended of those inhabitants of Egypt whom the Arabs subdued; and who were composed of original Egyptians, Persians, and Greeks. M. Volney is of opinion that their name of Copts is only an abbreviation of the Greek word *Αιγυπτίος*, an Egyptian. They are principally to be met with in the Said, though some also inhabit the Delta. They have all a yellowish dusky complexion, puffed up visages, swollen eyes, flat noses, and thick lips; and in fact, the exact countenance of the mulatto. The Mamelukes may be considered as the real masters of Egypt; and to secure themselves in the possession of the country, they took several precautions. One of the principal was the degradation of the military corps of azabs and janizaries, both of which were formerly very formidable. They effected this only in consequence of the wretched government of the Turks; for, before the revolt of Ibrahim Kiaya, the Turkish troops, which ought to have consisted of 40,000, were reduced to less than half that number through the avarice of their officers. Their degradation was completed by Ali Bey; who, having first displaced all the officers who gave him any umbrage, left their places vacant, and so reduced the consequence of the whole, that the azabs and janizaries are now only a rabble, who dread the Mamelukes as much as the meanest of the populace. The principal body of the Mamelukes reside at Cairo; but many of them are dispersed through the country, in order to keep up their authority, collect

the tribute, and oppress the people. They are all horsemen; and as war is accounted the only honourable employment among them, it is reckoned disgraceful to walk on foot, none but cavalry being by them accounted soldiers. The Turks have the title of being masters of Egypt, but are chiefly to be met with at Cairo, where they possess the religious and military employments. Formerly they possessed also the posts under government; but these were of late monopolised by the Mamelukes. Besides camels, horses, asses, mules, sheep, black cattle, and other domestic quadrupeds, there are many wild animals in Egypt; particularly tigers, hyenas, antelopes, crocodiles, apes with heads resembling those of dogs, hippopotamuses, ichneumons, chameleons, yellow lizards, and a species of rats resembling ferrets, remarkably useful for destroying the crocodiles' eggs. Among the feathered tribe, there are ostriches, eagles, hawks, pelicans, and water fowls of various kinds, among which last the most remarkable is the ibis, a bird of the duck kind, which was deified by the ancient Egyptians, on account of its usefulness in destroying serpents and noxious insects. These are numerous, and among the different species of serpents the cerastes, or horned viper, abounds, whose bite proves mortal, except to those who have the secret of charming it. "It would require volumes," (says John Walker, in his "Elements of Geography,") to describe the astonishing remains of ancient temples, palaces, columns, statues, paintings, &c. that are so profusely scattered over a great part of this once renowned country. Some of these we have already described. See ALEXANDRIA and CATACOMBS, others will be found in their order. See LABYRINTH, OBELISK, and PYRAMIDS. M. Volney says, "the soil of Egypt is the most fruitful of the whole earth, the easiest cultivated, and the most certain in its crops. Plenty does not there depend as in the Morea and Candia upon the contingency of rain." Egypt was in the earliest ages much celebrated for its fertility. This Volney ascribes to the salt with which it abounds. So great is the propensity of the Egyptian soil to produce salt, that even when the gardens are overflowed for the sake of watering them, the surface of the ground, after the evaporation and absorption of the water, appears glazed over with salt. The water found in the wells contains mineral alkali, marine salt, and a little nitre. M. Volney is of opinion, that the fertile mould of Egypt, which is of a black colour, differs essentially from that of the other parts; and is derived from the internal parts of Ethiopia along with the waters of the Nile; but there is no reason to suppose this kind of earth to be of a foreign origin; it being always the result of vegetation and cultivation. Even the most barren and sandy spots in the world, if properly watered, and such vegetables planted in them as would grow there, in time would be covered with this black earth as well as others: and of this kind of artificial formation of soil, Dr. Shaw gives a remarkable instance in the garden of the monks at mount Sinai, which they have rendered very fertile, though the country is naturally as barren as in any place of the world. On the whole, we may reasonably conclude, that the natural fertility of Egypt is not diminished in modern times, provided the same pains were taken in the cultivation of it as formerly. "The Delta," (says M. Savary,) is at present in the most favourable state for agriculture. Washed on the E. and W. by two rivers formed by the division of the Nile, each of which is as large and more deep than the Loire, and intersected by innumerable rivulets; it presents to the eye an immense garden, all the different compartments of which may be easily watered. During the three months that the Thebais is under water, the Delta possesses fields covered with rice, barley, vegetables, and winter fruits. It is also the only part of Egypt where the same field produces two crops of grain within the year, the one of rice, the other of barley." Oranges, lemons, figs, dates, almonds, cassia, plantains, &c. abound in it. But the territory of Egypt in general produces every thing that either Europe or Asia can boast; as corn, rice, cotton, flax, indigo, sugar, saffron, coffee, sena, rhubarb, aloes, opium, &c. The only cause of all this fertility is the Nile, without which the whole country would soon become an uninhabitable desert, as rain falls very seldom in this part of the world.

EGYPT, PYRAMIDS OF. See PYRAMIDS.

EGYPTEN, a town of the duchy of Courland, 100 miles S. E. of Mitau. Lon. 26. 40. E. Lat. 56. 2. N.

EGYPTIANS, the inhabitants of Egypt. See EGYPT. T. the different races mentioned under that article.

considerable number of Jews, Greeks, and Syrians, who are mingled with the other Egyptians.

EGYPTIANS, or GYPSIES. See GYPSIES.

EGYPTIAN THORN. See ACACIA.

EHINGEN, or EBINGEN, a town of Germany, in Suabia, on the Danube. Lon. 9. 45. E. Lat. 48. 18. N.

EHINGEN, or EBINGEN, a town in Suabia, on the Neckar, belonging also to Austria. Lon. 8. 45. E. Lat. 48. 25. N.

EHLE, a river of Germany, in Upper Saxony, which runs into the Elbe, near Magdeburg.

EHRETIA, a genus of the monogynia order, and pentandria class of plants; natural order, Asperifolize. Fruit a bilocular berry; seeds solitary, bilocular; stigma emarginated. Five species, which are trees or shrubs.

EHRFELDEN, a town of Germany, in the circle of the Upper Rhine, 8 miles W. of Darmstadt.

EHRHARTA, in botany, a genus of the monogynia order, and hexandria class of plants. Calyx a two-valved, abbreviated, one-flowered glume; corolla a double glume, each two-valved, the exterior one compressed, and scymeter-shaped, transversely wrinkled, and gashed at the base; stigma simple, compressed, four-tufted. It has five species.

EHUD, the son of Gera, a Benjamite, who delivered the republic of Israel from the oppressions of Eglon, king of the Moabites, by assassinating the tyrant in his own parlour; A. M. 2570, according to Alstedius, or as others have it, A. M. 2679. Ehud is ranked by chronologers, as the third judge of Israel after Moses, although he is not expressly mentioned in scripture as a judge, but only as a deliverer. See Judges iii. 15—31.

EIA and EY, in our old writers, are used for an island. Hence the names of places ending in *ey*, denote them to be islands. Thus, Ramsey, the isle of rams; Shepey, the isle of sheep, &c.

EIA is also sometimes used for water; and hence the names of places near waters or lakes terminate in *ey*.

EICHENBUHL, a town of Germany, in the late circle of the Lower Rhine, 29 miles of Heidelberg.

EICHSFELD, or EISFELD, a county of Germany in the late circle of the Lower Rhine.

EICHTERNACH, a town of France, in the department of Forests, and late province of Luxemburgh; 9 miles N. W. of Treves.

EJECTA, a term used by lawyers for a woman deflowered, or cast from the virtuous.

EJECTION, [*ejectio*, Lat.] in Scots law, is the turning out the possessor of any heritable subject by force; and is either legal or illegal.

1. EJECTION, ILLEGAL, is one person's violently turning another out of possession, without lawful authority.

2. EJECTION, LEGAL, is where a person having no title to possess, is turned out by the authority of law.

EJECTMENT, in English law, a writ or action which lies for the lessee for years, on his being ejected or put out of his land, before the expiration of his term, either by the lessor or a stranger. It may also be brought by the lessor against the lessee, for rent in arrears, or holding over his term, &c. Ejectment of late is become an action in the place of many real actions, as writs of right, formedons, &c. which are very difficult, as well as tedious and expensive; and this is now the common action for trial of titles, and recovering of lands, &c. illegally held from the right owner; yet where entry is taken away by descent, fines, recoveries, disseins, &c. an ejectment shall not be brought; whereby we find that all titles cannot be tried by this action. The method of proceeding in the action of ejectment is to draw up a declaration, and feign therein a lease for three, five, or seven years, to him that would try the title; and also feign a casual ejector or defendant; and then deliver the declaration to the ejector, who serves a copy of it on the tenant in possession, and gives notice at the bottom, for him to appear and defend his title; or that, he the feigned defendant will suffer judgement by default, whereby the true tenant will be turned out of possession; to this declaration the tenant is to appear at the beginning of next term by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence, in which he must confess lease, judgement, entry, and auster, and at the trial stand upon the title only;

but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear as aforesaid, the court will order judgement to be entered against the casual ejector by default; and thereupon the tenant in possession, by writ habere facias possessionem, is turned out. On the trial in ejectment, the plaintiff's title is to be set forth from the person last seised in fee, under whom the lessor claims down to the plaintiff, proving the deeds, &c. and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who has title to the land, may be defendant in the action with the tenant in possession; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

EIFELD, EICHFIELD, or ELFELD, a town of Germany, in the late circle of the Lower Rhine and electorate of Mentz, eight miles N. W. of Mentz.

EIFFEL, a department of France one of the six new ones formed in Dec. 1797, out of the conquered countries on the left bank of the Rhine. It comprehends part of the late duchies of Juliers and Aremberg, part of the electorate of Cologne, with the towns of Aix la Chapelle, Coblenz, &c. Coblenz is reckoned the chief town.

EIMEO, or EIMEEO, one of the Society islands, in the South Pacific ocean, almost wholly surrounded with rocks, four leagues W. from the N. W. part of Otaheite. Lat. 17. 30. S. Lon. 149. 54. W. in parts of a degree, and 9h. 59m. 36s. in time.

EINBECK, or EIMBECK, a town of Germany, in Lower Saxony, 48 miles S. S. W. of Brunswick.

EISENACH, a late principality of Germany, in Thuringia, and circle of Upper Saxony, situated on the confines of Hesse. It is mountainous, and hardly produces corn enough for the inhabitants. Some wine is made, but of a very indifferent sort. It has some mines of copper, iron, vitriol, and alum, with some salt springs.

EISENACH, the capital of the above country, 26 miles W. S. W. of Erfurt.

EISKOI, a town of Russia, in the government of Caucasus, on the E. coast of the sea of Azoph, 50 miles S. W. of Azoph.

EISLEBEN, a town of Germany, in the late electorate of Saxony, and county of Mansfeld. It is 12 miles W. of Hall.

EKATERINEBURG, or CATHERINBURG, a province of Russia, in the government of Perm, about 360 miles long, and from 100 to 160 broad.

EKATERINEBURG, the capital of the above province. It is 148 miles S. E. of Perm, and 960 E. S. E. of Petersburg.

EKATERINOGRAD, or CATHERINOGRAD, a town of Russia, in the government of Caucasus, on the Malva.

EKATERINOSLAVSKOI, or CATHERINENSLAVSKOI, a province of Russia, in the government of Ekaterinoslaw, comprehending what has formerly been called Budziac Tartary, and the Ukraine, now a part of the government of Ekaterinoslaw.

EKEBERGIA, a genus of the class and order decandria monogynia. Calyx four-parted; petals four; berry contains five oblong seeds. There is one species, a tree of the Cape.

EKEREFOED, or EKRENFORD, a town of Denmark, in the duchy of Sleswick. It is 12 miles S. E. of Sleswick. Lon. 10. 20. E. Lat. 54. 56. N.

EKESIO, a town of Sweden, in the province of Smaland, 60 miles N. W. of Calmar.

EKIE, a town of Asia, in Thibet, 55 miles S. of Toson Hotun.

EKRON, a city and government of the Philistines. It fell by lot to the tribe of Judah, in the first division made by Joshua (xv. 45,) but was afterwards given to the tribe of Dan. (xix. 43.) It was situated near the Mediterranean, between Ashdod and Jamnia. Ekron was a powerful city, and it does not appear that the Jews were ever sole peaceable possessors of it: the Ekronites were the first who said that it was necessary to send back the ark of the God of Israel, in order to be delivered from those calamities which the presence of it brought upon their country. 1. Sam. v. 10. The idol Baalzebub was principally adored at Ekron. 2. Kings i. 2. &c.

EKSENIDE, a town of Asiatic Turkey, in the province of Natolia, 84 miles S. of Dognizlu.

ELABORATORY. See LABORATORY.

ELEAGNUS, the OLEASTER, or WILD OLIVE, a genus of the monogynia

monogynia order, and tetrandria class of plants; natural order, Calycistoreæ. No corolla; calyx campanulated, quadrifid, superior; drupe below the calyx. It has nine species.

ELEOCARPUS, in botany, a genus of the monogynia order, and polyandria class of plants. Corolla pentapetalous, lacerated; calyx pentaphyllous; drupe with a wrinkled kernel. It has six species mostly natives of the East Indies.

ELEODENDRUM, in botany, a genus of the monogynia order, and pentandria class of plants. Corolla five-petaled: drupe ovate, with a two-celled nut. There are two species, of which *E. orientale* is a moderate-sized twiggly shrub, or tree, a native of the oriental regions.

ELEOTHESIUM, in antiquity, the anointing room, or place where those, who were to wrestle or had bathed, anointed themselves.

ELAIS, in botany, a genus belonging to the natural order of Palmae. Male calyx hexaphyllous; corolla sexfid; stamina six: female calyx hexaphyllous; corolla hexapetalous; stigmata three; drupe fibrous, with a three-valved kernel. It has one species.

ELAM, (עֵלָם, Heb. i. e. a young man,) one of the sons of the patriarch Shem.

ELAM, in ancient geography, a country frequently mentioned in Scripture, lying S. E. of Shinar. In the time of Daniel (vii. 2.) Susiana seems to have been part of it; and before the captivity, it does not appear that the Jews called Persia by another name. Elymæ and Elymais are often mentioned by the ancients. Ptolemy, though he makes Elymais a province of Media, places Elymæ in Susiana, near the sea-coast. Stephanus takes it to be a part of Assyria: but Pliny and Josephus more properly of Persia, whose inhabitants the latter tells us sprang from the Elamites.

ELAPHEBOLIA, [from ελαφος, a deer,] in Grecian antiquity, a festival in honour of Diana the huntress. In the celebration a cake was made in the form of a deer, and offered to the goddess.

ELAPHEBOLIUM, in Grecian antiquity, the ninth month of the Athenian year, answering to the latter part of February and beginning of March. It consisted of 30 days; and took its name from the Elaphebolia, which was celebrated in it.

ELASTIC, **ELASTIC**, [from ελαστος,] having the power of returning to the form from which it is distorted or withheld; springy: having the power of a spring.

ELASTIC FLUIDS. See PNEUMATICS, ELECTRICITY, GAS, &c.

ELASTICITY, a force in bodies, by which they endeavour to restore themselves to the posture from whence they were displaced by any external force. The principal phenomena observable in elastic bodies are: 1. That a body perfectly elastic, endeavours to restore itself with the same force with which it is pressed or bent. 2. An elastic body exerts its force equally towards all sides. 3. Elastic bodies in what manner soever struck, or impelled, are inflected, and rebound after the same manner: thus a bell yields the same musical sound, in what manner or on what side soever it be struck; the same of a tense or musical chord; and a body rebounds from a plane in the same angle in which it meets or strikes it, whether the intensity of the stroke be greater or less. 4. The elastic properties of bodies seem to differ, according to their greater or less density or compactness, though not in an equal degree: thus, metals are rendered more compact and elastic by being hammered: tempered steel is much more elastic than soft steel; and the density of the former is to that of the latter as 7809 to 7738: cold condenses solid bodies, and renders them more elastic; whilst heat, that relaxes them, has the opposite effect: but, on the contrary, air, and other elastic fluids, are expanded by heat, and rendered more elastic. For the cause of elasticity, and other phenomena of this property of bodies, See PHYSICS.

ELATE, in botany, a genus belonging to the natural order of Palmae. Male, calyx three-toothed; corolla three-petaled; anthers six, sessile. Female, calyx one-leaved; corolla three-petaled; pistils one; stigmas three; drupe one-seeded. There is but one species, viz. *E. sylvestris*, prickly-leaved elate, native of the East Indies.

ELATER, in zoology, a genus of the class and order insecta coleoptera. Antennæ setaceous; an elastic spring or spine projects from the hinder extremity of the breast or under side of the thorax. By means of this kind of spring, the animal, when turned upon his back, contrives to leap up into the air, and so turn itself. About 200 species are enumerated, and divided in two sections, A. feelers hatchet-shaped; B. feelers clavate, the club round; of this division there are three species. When the insect is young and

newly metamorphosed, its elytra are of a beautiful deep red; but in a few days they change to a much darker hue, and are nearly of a chesnut colour. In the state of larvæ it inhabits the trunks of decayed trees, and is there transformed. See Plate XXXVII.

ELATERIUM, [Lat.] an inspissated juice, light, of a friable texture, and an acrid and pungent taste.

ELATERIUM, [ελατηριον,] a genus of the monandria order and monœcia class of plants; natural order, Cucurbitaceæ. There is neither male nor female calyx; corolla salver-shaped; capsule inferior, unilocular, and bivalved. It has two species.

ELATH, or **ELOTH**, in ancient geography, a part of Idumæa situated upon the Red Sea, which David in his conquest of Edom took, (2 Sam. viii. 14,) and there established a trade to all parts of the world. Solomon built ships in Elath, and sent them from thence to Ophir for gold, 2 Chron. viii. 17, 18.

ELATINE, in botany, a genus of the tetragynia order, and octandria class of plants: natural order, Inundatæ. Calyx four-leaved; petals four; capsule four-celled, four-valved, flattened. Two species, annual aquatic herbs, very low and spreading.

ELATMA, a town of Russia, in the government of Tambov, on the Oka, 132 miles N. of Tambov.

ELBA, an island in the Mediterranean, near the coast of Tuscany, eight miles long and two broad, 36 miles W. of Cape Corso.

ELBASSANO, a town of European Turkey, in Albania; 45 miles S. E. of Durazzo. Lon. 20. 9. E. Lat. 41. 34. N.

ELBE, a large river in Germany, anciently called Albis, which rising on the confines of Silesia, runs through Bohemia, Misnia, Upper Saxony, Anhalt, Magdeburg, Brandenburg, and Danneberg; and falls into the German ocean, about 70 miles below Hamburg. It is navigable for great ships higher than any other river in Europe.

ELBE, another river of Germany, in the Upper Rhine.

ELBERTON, a town in Effingham county, Georgia, on the N. E. bank of Ogeechee river. Lon. 80. 30. W. Lat. 32. 18. N.

ELBEUF, a town of France, in the department of the Lower Seine, 65 miles N. W. of Paris.

ELBING, a city in the duchy of Warsaw, and kingdom of Saxony, 30 miles S. E. of Dantzick. Lon. 19. 35. E. Lat. 54. 9. N.

ELBING, a river of the late Polish Prussia, in Marienburg.

ELBOGEN, a circle of Bohemia.

ELBOGEN, the capital of the above circle, with a citadel, 16 miles N. E. of Egra. Lon. 13. 0. E. Lat. 50. 16. N.

ELBOW. That eminence whereon the arm rests, is by the Latins called cubitus, and the Greeks αγκυων, and ολεκρανον. See ANATOMY.

ELBOW is also used by architects, masons, &c. for an obtuse angle of a wall, building, or road, which diverts it from its right line.

ELBURG, a town of Batavia or Holland late in the department of Yssel, and province of Guelderland, 10 miles N. E. of Harderwick.

ELCATIF, a sea-port of Arabia Felix, on the W. coast of the Gulf of Persia. Lon. 53. 5. E. Lat. 26. 0. N.

ELCESAITES, in church history, a sect of heretics, who appeared in the reign of Trajan. They worshipped one God, observed the Jewish Sabbath, circumcision, and the other ceremonies of the law; but they rejected the Pentateuch, the prophets, and the writings of the apostles, particularly those of St. Paul.

ELCHE, a town of Spain in Valencia, in a forest of palm-trees, olives, and vines. Lon. 0. 23. W. Lat. 38. 7. N.

ELDEN HOLE, a famous natural cavern in Derbyshire, three miles from Buxton, ranked among the wonders of the Peak. It is a large and deep perpendicular chasm, of which the bottom has not yet been found, whence it is pretended to be unfathomable. Cotton says he sounded to the depth of 884 yards, yet the plummet still drew.

ELDER, in botany. See SAMBUCUS.

ELDERS, or **SENIORS**, in the ancient Jewish polity, were persons the most considerable for age, experience, and wisdom. Of this sort were the 70 men whom Moses associated with himself in the government; such, likewise, afterwards were those who held the first rank in the synagogue, as presidents.

ELDERS, in church history, were originally those who held the first place in the assemblies of the primitive Christians. The word presbyter is often used in the New Testament in this signification: hence the first councils of Christians were called presbyteria, or council of elders.

ELDERS,

ELDERS, in the Presbyterian discipline, are officers, who, in conjunction with the ministers and deacons, compose the kirk-sessions, who formerly used to inspect and regulate matters of religion and discipline; but whose principal business now is to take care of the poor's funds, which, it is but justice to say, they do all over Scotland with the utmost fidelity. They are chosen from among the people, and are received publicly with some degree of ceremony. In Scotland, there is an indefinite number of elders in each parish; generally about 12.

ELEA, or **ELIS**, in ancient geography, a district of Peloponnesus, situated between Achaia and Messenia, reaching from Aradia quite to the west or Ionian sea; so called from the city of Elis.

ELEA, or **VELIA**, an ancient town of the Lucani, where the Eleatic philosophy was first taught.

ELEATIC PHILOSOPHY, among the ancients; a name given to that of the stoics, because taught at Elea.

ELEATIC SECT. The founder of this sect of philosophers is supposed to have been Xenophanes, who lived about the 56th Olympiad, or about B. C. 550. It was divided into two parties, which may be denominated metaphysical and physical; the one rejecting, and the other approving, the appeal to fact and experiment. Of the former kind were Xenophanes, Parmenides, Melissus, and Zeno of Elea. They are supposed to have maintained principles similar to those of Spinoza: they held the eternity and immutability of the world; that whatever existed was only one being; that there was neither any generation nor corruption; that this one being was immovable, and immutable, and was the true God; and whatever changes seemed to happen in the universe, they considered as mere appearances and illusions of sense. However, some learned men have supposed, that Xenophanes and his followers, speaking metaphysically, understood by the universe, or the one being, not the material world, but the originating principles of all things, or the true God, whom they expressly affirm to be incorporeal. Thus Simplicius represents them merely metaphysical writers, who distinguished between things natural and supernatural; and who made the former to be compounded of different principles. Accordingly, Xenophanes maintained, that the earth consisted of air and fire, that all things were produced out of the earth, and the sun and stars out of clouds, and that there were four elements. Parmenides also distinguished between the doctrine concerning metaphysical object called truth, and that concerning physical or corporeal things, called opinion; with respect to the former there was one immovable principle, but in the latter two that were moveable, viz. fire and earth, or heat and cold; in which particulars Zeno agreed with him. The other branch of the Eleatic sect were the atomic philosophers, who formed their system from an attention to the phenomena of nature; of these the most considerable were Leucippus, Democritus, and Protagoras.

ELECAMPANE, in botany. See **INULA**.

ELECT, **ELECTI**, among ecclesiastical writers, those whom God has chosen, or predestinated to be saved. See **PREDESTINATION**.

ELECT, in matters of polity, is applied to archbishops, and other ecclesiastic officers, who are chosen, but not yet consecrated; as also to secular officers before they are invested with their office or jurisdiction: thus the emperor is said to be elect, before he is inaugurated; and the lord mayor, before his predecessor's mayoralty is expired.

ELECTION, a term frequently used in mathematics, to signify the several different ways of taking any number of things proposed, either separately, or as combined in pairs, in threes, in fours, &c. not as to the order, but only as to the number and variety of them. Thus, of the things *a, b, c, d*, &c. the elections

$$\begin{array}{l} \text{One thing} \\ \text{Two things} \\ \text{Three things} \end{array} \left. \begin{array}{l} \\ \\ \end{array} \right\} \text{are } \left\{ \begin{array}{l} (a) 1 = 2^1 - 1 \\ a, b, ab) 3 = 2^2 - 1 \\ a, b, c, ab, ac, bc, abc) 7 = 2^3 - 1 \end{array} \right.$$

And generally of any number *n*, all the elections are $2^n - 1$; that is one less than the power of 2, whose exponent is *n*, the number of single things to be chosen either separately, or in combination; thus, when $n = 12$, the answer is $2^{12} - 1 = 4096 - 1 = 4095$.

ELECTION, the choice that is made of a person, or thing, in preference to any other; as in the election of an emperor, of a pope, of a bishop, of members of parliament, &c.

ELECTION, in law, is where a person has a choice of one or more

things which happen upon several occasions; as where he has by law two remedies, and must take only one: thus, a creditor, in cases of bankruptcy, may either prove his debt under the commission, or proceed at law; but in this case he is compelled to make his election: where also a person having obtained a judgement, is entitled to execution, he may either take his remedy against the goods or the person of his debtor; but if he proved against the person in the first instance, he cannot afterwards have recourse to the goods; but if he take the goods, and these should be found inadequate to his demand, he may afterwards take the body.

ELECTION, in theology. See **PREDESTINATION**, and **GRACE**.

ELECTION, in British polity, is the people's choice of their representatives in parliament. See **PARLIAMENT**. In this consists the exercise of the democratical part of our constitution: for in a democracy there can be no exercise of sovereignty but by suffrage, which is the declaration of the people's will. In all democracies, therefore, it is of the utmost importance to regulate by whom, and in what manner, the suffrages are to be given. And the Athenians were so justly jealous of this prerogative, that a stranger, who interfered in the assemblies of the people, was punished with death, being esteemed guilty of high treason, by usurping those rights of sovereignty to which he had no title. In Britain, says Blackstone, where the people do not debate in a collective body, but by representation, the exercise of this sovereignty consists in the choice of representatives. The laws have therefore very strictly guarded against the usurpation or abuse of this power, by many salutary provisions; which may be reduced to these three points. 1. The qualifications of the electors. 2. The qualifications of the elected. 3. The proceedings at elections.

1. **ELECTION LAWS AS TO THE QUALIFICATIONS OF ELECTORS.** The true reason of requiring any qualification, with regard to property, in voters, is to exclude such persons as are in so mean a situation, that they are esteemed to have no will of their own. If these persons had votes, they would be tempted to dispose of them under some undue influence or other. This would give a great, an artful, or a wealthy man, a larger share in elections than is consistent with general liberty. If it were probable that every man would give his vote freely, and without influence of any kind; then, upon the true theory and genuine principles of liberty, every member of the community, however poor, should have a vote in electing those delegates to whose charge is committed the disposal of his property, his liberty, and his life. But since that can hardly be expected in persons of indigent fortunes, or such as are under the immediate dominion of others, all popular states have been obliged to establish certain qualifications; whereby some, who are suspected to have no will of their own, are excluded from voting, in order to set other individuals, whose will may be supposed independent, more thoroughly upon a level with each other. And this constitution of suffrages is framed upon a wiser principle, with us, than either of the methods of voting, by centuries or by tribes, among the Romans. In the method by centuries, instituted by Servius Tullus it was principally property, and not numbers, that turned the scale; in the method by tribes, gradually introduced by the tribunes of the people, numbers only were regarded, and property entirely overlooked. Hence the laws passed by the former method had usually too great a tendency to aggrandize the patricians or rich nobles; and those by the latter had too much of a levelling principle. Our constitution steers between the two extremes. Only such are entirely excluded as can have no will of their own: there is hardly a free agent to be found, but what is intitled to a vote in some place or other in the kingdom. Nor is comparative wealth, or property, entirely disregarded in elections; for though the richest man has only one vote at one place, yet, if his property be at all diffused, he has probably a right to vote at more places than one, and therefore has many representatives. This is the spirit of our constitution: not that we assert it is in fact quite so perfect as we have endeavoured to describe it; for if any alteration might be wished or suggested in the present form of parliament, it should be in favour of a more complete representation of the people. But to return to the qualifications; and first those of electors for knights of the shire. 1. By statute 8 Hen. VI. c. 7. and 10 Hen. VI. c. 2. (amended by 14 Geo. III. c. 58.) the knights of the shire shall be chosen of people, whereof every man shall have freehold to the value of 40 shillings by the year within the county; which (by subsequent statutes) is to be clear of all charges and deductions, except parliamentary

and parochial taxes. The knights of shires are the representatives of the landholders, or landed interest of the kingdom: their electors must therefore have estates in lands or tenements within the county represented. These estates must be freehold, that is, for term of life at least; because beneficial leases for long terms of years were not in use at the making of these statutes, and copyholders were then little better than villeins, absolutely dependent upon their lords. This freehold must be of 40 shillings annual value; because that sum would then, with proper industry, furnish all the necessities of life, and render the freeholder, if he pleased, an independant man. For bishop Fleetwood, in his *Chronicon Pretiosum*, written at the beginning of the 18th century, has fully proved 40 shillings in the reign of Henry VI. to have been equal to 12 pounds per annum in the reign of Queen Anne; and, as the value of money is very considerably lowered since the bishop wrote, we may fairly conclude, from this and other circumstances, that what was equivalent to 12 pounds in his days, is equivalent to 25 pounds at present. The other less important qualifications of the electors for counties in England and Wales may be collected from the statutes 7 and 8 Will. III. c. 25, 10 Ann. c. 23, 2. Geo. II. c. 24, 18 Geo. II. c. 18, 31 Geo. II. c. 14, 3 Geo. III. c. 24, which direct, 2. That no person under twenty-one years of age shall be capable of voting for any member. This extends to all sorts of members as well for boroughs as counties; as does also the next, viz. 3. That no person convicted of perjury, or subornation of perjury, shall be capable of voting in any election. 4. That no person shall vote in right of any freehold, granted to him fraudulently to qualify him to vote. Fraudulent grants are such as contain an agreement to recover, or to defeat the estate granted; which agreements are made void, and the estate is absolutely vested in the person to whom it is so granted. And, to guard the better against such frauds, it is farther provided. 5. That every voter shall have been in the actual possession, or receipt of the profits, of his freehold to his own use for 12 calendar months before; except it came to him by descent, marriage, marriage settlement, will, or promotion, to a benefice or office. 6. That no person shall vote in respect of an annuity or rent-charge, unless registered with the clerk of the peace 12 calendar months before. 7. That in mortgaged or trust-estates, the person in possession, under the above-mentioned restrictions, shall have the vote. 8. That only one person shall be admitted to vote for any one house or tenement, to prevent the splitting of freeholds. 9. That no estate shall qualify a voter, unless the estate has been assessed to some land-tax aid, at least 12 months before the election. 10. That no tenant by copy of court-roll shall be permitted to vote as a freeholder. Thus much for the electors in counties. As for the electors of citizens and burgesses, these are supposed to be the mercantile part or trading interest of this kingdom. But as trade is of a fluctuating nature, and seldom long fixed in a place, it was formerly left to the crown to summon pro re nata, the most flourishing towns to send representatives to parliament. So that as towns increased in trade, and grew populous, they were admitted to a share in the legislature. But the misfortune is, that the deserted boroughs continued to be summoned, as well as those to whom their trade and inhabitants were transferred; except a few which petitioned to be eased of the expence, then usual, of maintaining their members: four shillings a-day being allowed for a knight of the shire, and two shillings for a citizen or burgess; which was the rate of wages established in the reign of Edward III. Hence the members for boroughs now bear above a quadruple proportion to those for counties; and the number of parliament men is increased since Portescue's time, in the reign of Henry VI. from 300 to upwards of 500, exclusive of those for Scotland. The universities were, in general, not empowered to send burgesses to parliament; though once, in 28 Edw. I. when a parliament was summoned to consider of the king's right to Scotland, there were issued writs, which required the university of Oxford to send up four or five, and that of Cambridge two or three, of their most discreet and learned lawyers for that purpose. But it was king James I. who indulged them with the permanent privilege to send constantly two of their own body; to serve for those students who, though useful members of the community, were neither concerned in the landed nor the trading interest; and to protect in the legislature the rights of the republic of letters. The right of election in boroughs is various, depending entirely on the several charters, customs, and

constitutions, of the respective places; which has occasioned infinite disputes: though now, by statute 2 Geo. II. c. 24. the right of voting for the future shall be allowed according to the last determination of the house of commons concerning it; and, by statute 3 Geo. III. c. 15, no freeman of any city or borough (other than such as claim by birth, marriage, or servitude,) shall be intitled to vote therein, unless he hath been admitted to his freedom twelve calendar months before.

2. ELECTION LAWS AS TO THE QUALIFICATIONS OF PERSONS TO BE ELECTED. Some of the qualifications to be elected members of the house of commons depend upon the law and custom of parliaments; declared by the house; others upon certain statutes. And from these it appears, 1. That they must not be aliens born, or minors. 2. That they must not be any of the 12 judges, because they sit in the lords' house; nor of the clergy, for they sit in the convocation: nor persons attainted of treason, or felony, for they are unfit to sit any where. 3. That sheriffs of counties, and mayors and bailiffs of boroughs, are not eligible in their respective jurisdictions, as being returning officers; but that sheriffs of one county are eligible to be knights of another. 4. That, in strictness, all members ought to have been inhabitants of the places for which they are chosen; but this, having been long disregarded, was at length entirely repealed by statute 14 Geo. III. c. 58. 5. That no persons concerned in the management of any duties or taxes created since 1692, except the commissioners of the treasury, nor any of the offices following (viz. commissioners of prizes, transports, sick and wounded, wine-licences, navy, and victualling; secretaries, or receivers of prizes; comptrollers of the army accounts; agents for regiments; governors of plantations, and their deputies; officers of Minorca, or Gibraltar; officers of the excise, and customs; clerks or deputies in the several offices of the treasury, exchequer, navy, victualling, admiralty, pay of the army or navy, secretaries of state, salt, stamps, appeals, wine-licences, hackney-coaches, hawkers, and pedlars,) nor any person that holds any new office under the crown created from 1705, are capable of being elected, or sitting as members. 6. That no person having a pension under the crown during pleasure, or for any term of years, is capable of being elected or sitting. 7. That if any member accepts an office under the crown, except an officer in the army or navy accepting a new commission, his seat is void; but such member is capable of being re-elected. 8. That all knights of the shire shall be actual knights, or such notable esquires and gentlemen as have estates sufficient to be knights, and by no means of the degree of yeomen. This is reduced to a still greater certainty, by ordaining, 9. That every knight of a shire shall have a clear estate of freehold or copyhold to the value of 600*l.* per annum, and every citizen and burgess of the value of 300*l.* except the eldest sons of peers and of persons qualified to be knights of shires, and except the members for the two universities: which somewhat balances the ascendant which the boroughs have gained over the counties, by obliging the trading interest to make choice of landed men: and of this qualification the member must make oath, and give in the particulars in writing, at the time of his taking his seat. But, subject to these standing restrictions and disqualifications, every subject of the realm is eligible of common right: though there are instances, wherein persons in particular circumstances have forfeited that common right, and have been declared ineligible for that parliament, by a vote of the house of commons; or for ever, by an act of the legislature. But it was an unconstitutional prohibition, which was grounded on an ordinance of the house of lords, and inserted in the king's writs, for the parliament holden at Coventry, 6 Hen. IV. that no apprentice or other man of the law should be elected a knight for the shire therein: in return for which, our law-books and historians have branded this parliament with the name of *parlamentum indoctum*, or the lack-learning parliament; and Sir Edward Coke observes with some spleen, that there was never a good law made thereat.

3. ELECTION LAWS RESPECTING THE METHOD OF PROCEEDING. The third point, regarding elections, is the method of proceeding therein. This is also regulated by the law of parliament, and by various statutes, all of which we shall blend together, and extract out of them a summary account of the method of proceeding to elections. As soon as the parliament is summoned, the lord chancellor, (or if a vacancy happens during the sitting of parliament, the speaker, by order of the house, and without such order

der if a vacancy happens by death in the time of a recess for upwards of twenty days) sends his warrant to the clerk of the crown in chancery; who thereupon issues out writs to the sheriffs of every county, for the election of all the members to serve for that county, and every city and borough therein. Within three days after the receipt of this writ, the sheriff is to send his precept, under his seal, to the proper returning officers of the cities and boroughs, commanding them to elect their members: and the said returning officers are to proceed to election within eight days from the receipt of the precept, giving four days notice of the same; and to return the persons chosen, together with the precept, to the sheriff. But elections of knights of the shire must be proceeded to by the sheriffs themselves in person, at the next county-court that shall happen after the delivery of the writ. The county-court is a court held every month, or oftener, by the sheriff, intended to try little causes not exceeding the value of 40s. in what part of the county he pleases to appoint for that purpose; but for the election of knights of the shire, it must be held at the most usual place. If the county-court falls upon the day of delivering the writ, or within six days after, the sheriff may adjourn the court and election to some other convenient time, not longer than 16 days, nor shorter than 10; but he cannot alter the place, without the consent of all the candidates: and, in all such cases, 10 days public notice must be given of the time and place of the election. And, as it is essential to the very being of parliament that elections should be absolutely free, therefore all undue influences upon the electors are illegal, and strongly prohibited. For Mr. Locke ranks it among those breaches of trust in the executive magistrate, which, according to his notions, amount to a dissolution of the government, "if he employ the force, treasure, and offices, of the society to corrupt the representatives, or openly to pre-engage the electors, and prescribe what manner of persons shall be chosen: for thus to regulate candidates and electors, and new-model the ways of election, what is it (says he) but to cut up the government by the roots, and poison the very fountain of public security?" As soon, therefore, as the time and place of election, either in counties or boroughs, are fixed, all soldiers quartered in the place are to remove, at least one day before the election, to the distance of two miles or more; and not to return till one day after the poll is ended. Riots likewise have been frequently determined to make an election void. By vote also of the house of commons, to whom alone belongs the power of determining contested elections, no lord of parliament, or lord lieutenant of a county, hath any right to interfere in the election of commoners; and, by statute, the lord warden of the cinque-ports shall not recommend any members there. If any officer of the excise, customs, stamps, or certain other branches of the revenue, presumes to intermeddle in elections, by persuading any voter or dissuading him, he forfeits 100*l.* and is disabled to hold any office. Thus are the electors of one branch of the legislature secured from any undue influence from either of the other two, and from all external violence and compulsion. But the greatest danger is that in which themselves co-operate by the infamous practice of bribery and corruption. To prevent which it is enacted, that no candidate shall, after the date (usually called the teste) of the writs, or after the vacancy, give any money or entertainment to his electors, or promise to give any, either to particular persons, or to the place in general, in order to his being elected, on pain of being incapable to serve for that place in parliament. And if any money, gift, office, employment, or reward, be given, or promised to be given, to any voter, at any time, in order to influence him to give or withhold his vote, as well he that takes, as he that offers such bribe, forfeits 500*l.* and is for ever disabled from voting and holding any office in any corporation; unless, before conviction, he will discover some other offender of the same kind, and then he is indemnified for his own offence. The first instance that occurs of election bribery was so early as 13 Eliz. when one Thomas Longe

(being a simple man, and of small capacity to serve in parliament) acknowledged that he had given the returning officer and others of the borough for which he was chosen four pounds to be returned member, and was for that premium elected. But for this offence the borough was amerced, the member was removed, and the officer fined and imprisoned. But as this practice hath since taken much deeper and more universal root, it hath occasioned the making of these wholesome statutes; to complete the efficacy of which, there is nothing wanting but resolution and integrity to put them in strict execution. Undue influence being thus guarded against, the election is to be proceeded to on the day appointed; the sheriff or other returning officer first taking an oath against bribery, and for the due execution of his office. The candidates likewise, if required, must swear to their qualification, and the electors in counties to theirs; and the electors, both in counties and boroughs, are also compellable to take the oath of abjuration, and that against bribery and corruption. And it might not be amiss, if the members elected were bound to take the latter oath, as well as the former; which, in all probability, would be much more effectual than administering it only to the electors. The election being closed, the returning officer in boroughs return his precepts to the sheriff, with the persons elected by the majority: and the sheriff returns the whole, together with the writ for the county and the knights elected thereupon, to the clerk of the crown in chancery; before the day of meeting, if it be a new parliament, or within 14 days after the election, if it be an occasional vacancy; and this under penalty of 500*l.* If the sheriff does not return such knights only as are duly elected, he forfeits, by the old statutes of Henry VI. 100*l.*; and the returning officer in boroughs, for a like false return, 40*l.*; and they are besides liable to an action, in which double damages shall be recovered, by the later statutes of king William; and any person bribing the returning officer shall also forfeit 300*l.* But the members returned by him are the sitting members, until the house of commons, upon petition, shall adjudge the return to be false and illegal. The form and manner of proceeding upon such petition are now regulated by statute 10 Geo. III. c. 16, (amended by 11 Geo. III. c. 42, and made perpetual by 14 Geo. III. c. 15.), which directs the method of choosing by lot a select committee of 15 members, who are sworn well and truly to try the same, and a true judgement to give, according to the evidence.

ELECTION, OF ECCLESIASTICAL PERSONS. Elections for the dignities of the church ought to be free, according to the stat. 9 Ed. II. cap. 14. If any persons, that have a voice in elections, take any reward for an election in any church, college, school, &c. the election shall be void. And if any persons of such societies resign their places to others for reward, they incur a forfeiture of double the sum; and both the parties are rendered incapable of the place. Stat. 31 Eliz. cap. 6.

ELECTION, OF VERDERORS OF THE FOREST, (electione viridariorum forestæ), in law, a writ that lies for the choice of a verderor, where any of the verderors of the forest are dead, or removed from their offices. This writ is directed to the sheriff, and the verderor is to be elected by his freeholders of the county, in the same manner as coroners.

ELECTIVE ATTRACTION, the same with affinity, or chemical attraction. See **CHEMISTRY**.

ELECTOR, he that has a vote in the choice of any officer. See **ELECTION**.

ELECTORATE, the territory of an elector.

ELECTRA, in the pagan mythology, one of the seven daughters of Atlas and Pleione, who were fabled to have been changed into the constellation, Pleiades. She was the mother of Dardanus, the first king of Troy, by Jupiter; and according to Hyginus, withdrew her light upon the destruction of Troy.

ELECTRICIAN, one who makes electrical experiments, and endeavours to investigate the nature, causes, and effects, of electricity.

ELECTRICITY.

ELECTRICITY, [*ηλεκτρον*, amber,] is that part of natural philosophy which investigates the nature, properties and effects, of a certain subtle fluid, found to exist in the material world, and denominat-

ed the electrical fluid. The term electricity is also applied to denote the phenomena and state of bodies under the influence of the electric fluid. Few or none of the refinements of science afford

so agreeable relaxation to the serious and liberal mind, as philosophical experiments. The rational entertainment, and pleasing instruction, conveyed by such inquiries, are constantly found to extend the faculties of the soul with an exalted idea of the beauty and sublimity of nature, while the mind is almost irresistibly led on to contemplate and adore its divine source. Few other departments of science yield phenomena so pleasing, so various, and, at the same time, so astonishing, as that of electricity. The variety of appearances produced by an electrical machine, in a copious current of the fluid, are, indeed, sometimes so strikingly curious, that the mind seems to be in a manner suspended between admiration of the effects, and inquiry into the cause. This affection seems to be natural and rational. The human mind can neither cease to admire, nor remain satisfied with vague appearances. The superior objects of its desire are knowledge and certainty; in the pursuit of which its industry is cheerfully exerted and frequently rewarded with success.

HISTORY OF ELECTRICITY.

Although the electric fluid, ever since the creation, has had the same share in all the operations of nature, that it has at present, yet the discovery of its action, and even of its existence, is of a very late date. Thales the Milesian, who lived about B. C. 600, was the first who observed that amber, from which the name electricity is derived, would attract light bodies when it was rubbed. The ancient naturalist, Theophrastus, who flourished 300 years later, tells us, that the lycurium (now called tourmalin) has the property of attracting light bodies as well as amber. From this time there is a chasm in the history of electricity for no less than 1900 years. Indeed, it is scarce to be supposed, that during this long interval any person applied himself to the investigation of the subject; as, for the greatest part of it, science of every kind was almost totally extinguished. The electrical properties of jet, however, and, according to Mr. Boze, of the agate, were some way or other discovered during this period. But it was not till the beginning of the seventeenth century, that electricity became properly a distinct science, and the foundation was laid of those discoveries which have since taken place. Dr. William Gilbert, an English physician, who, in 1600 wrote a book de Magnete, containing various electrical experiments, was the first who properly merits the title of an electrician. He, like his predecessors, however, considered only the attractive property of electric substances. Dr. Gilbert's merit consists in his having been at great pains to find a number of such substances, and thus considerably enlarging the number of electrics; on which account M. Cavallo says, "he may be justly deemed the father of the present electricity." Sir Francis Bacon also made some electrical experiments; but no farther discoveries appear to have been made till 1670, except some trifling additions to the catalogue of electrics. About this time Mr. Boyle applied himself to the study of electricity. He enlarged the catalogue of electrics; and found that their electric properties were increased by wiping and warming them before they were rubbed. He observed also, that all kinds of bodies were attracted promiscuously; and imagined that they were attracted in vacuo as well as in air. This last position, however, is denied by Mr. Beccaria; and Mr. Boyle must have been mistaken. He also observed the electric light, though only in the instance of some diamonds. The science, however, was much farther improved by Otto Guericke, who was cotemporary with Mr. Boyle. He made use of a sulphur globe, whirled on an axis much in the same way with our present glass globes. Thus he could excite a vastly greater power of electricity than any of his predecessors, and try all their experiments to much more advantage. He discovered electric repulsion; and not only saw the electric light more clearly than Mr. Boyle, but heard the hissing sound with which it is emitted. He also made another remarkable discovery, but which has since been very generally overlooked; namely, that a feather, when repelled by an excited electric, always keeps the same face towards the body which repels it, as the moon does to the earth. The celebrated Sir Isaac Newton made the next discovery of any moment; by observing, that the electric attraction and repulsion penetrated through glass; and it is much to be regretted that this accurate philosopher did not apply himself to the study of electricity with greater assiduity. A Treatise on Electricity was published in 1709, by Mr. Hawkesbee; who not only far excelled all his predecessors and contem-

poraries, but also made some discoveries which well deserve the attention of the most expert electricians at this day. Besides many new experiments upon electric attraction and repulsion, as well as the light emitted by electric bodies; he found a method of rendering opaque bodies transparent by electricity. He lined more than half the inside of a glass globe with sealing-wax; and having exhausted the globe, he put it in motion; when applying his hand to excite it, he saw the shape and figure of all the parts of his hand distinctly and perfectly on the concave superficies of the wax within, just as if only pure glass without any wax at all had been interposed between his eye and his hand. The lining of wax, where it was spread thinnest, would but just allow the light of a candle through it in the dark; but in some places the wax was at least an eighth part of an inch thick. Yet even in these places the light and figure of his hand were as distinguishable through it as any where else. The sealing-wax did not adhere to the glass in all places; but this made no difference with regard to the transparency. Pitch answered the purpose equally well with sealing-wax. Mr. Hawkesbee also made a further improvement by using a glass globe, which acts more powerfully than a sulphur one. After the death of Mr. Hawkesbee, "the science of electricity," says M. Cavallo, "however hitherto advanced, remained about twenty years in a state of quiescence, the attention of philosophers being at that time engaged in other philosophical subjects, which on account of the new discoveries of the incomparable Sir Isaac Newton were then greatly in repute. Mr. Grey was the first after this period of oblivion to bring the science again to light. He by his great discoveries re-introduced it to the acquaintance of philosophers, and from him the true flourishing era of electricity may be said to take its date." Mr. Stephen Grey's capital discovery was the distinction between conductors and non-conductors of electricity. In Feb. 1729, Mr. Grey, after some fruitless attempts to excite an electric power in metals, recollected a suspicion he had for some time entertained, that as a glass tube, when excited in the dark, communicated its light to various bodies, it might at the same time possibly communicate to them a power of attracting light bodies; which as yet was all that was understood by the word electricity. For this purpose he procured a glass tube, 3 feet 5 inches long, and near one inch and two tenths in diameter. To each end he fitted a cork, to keep out the dust when the tube was not used. Mr. Grey's first experiments were made to determine whether the tube would attract equally well with the ends shut as with them open. In this respect there was no difference; but he found that the corks attracted and repelled light substances as well, and rather better, than the tube itself. He then fixed an ivory ball upon a stalk of fir about four inches long, and thrusting the end of the stalk into one of the corks, he found the ball endowed with a strong attractive and repulsive virtue. This experiment he repeated in many different ways; fixing the ball upon long sticks, and upon pieces of brass and iron wire, always with the same success; but he constantly observed, that the ball at the end attracted more vigorously than that part of the wire nearest the tube. Mr. Grey next tried whether the ball might be suspended by a pack-thread with a loop on the tube, and the event fully answered his expectation. Having thus suspended bodies of the greatest length he conveniently could, he ascended a balcony 26 feet high, and fastening a string to his tube, found that the ball would attract light bodies on the ground below. This experiment succeeding in the greatest heights to which he could ascend, he next attempted to carry the electricity horizontally; but in this he failed, because he suspended his line, which was intended to carry the electricity horizontally, by a pack-thread; and thus the fluid got off from it. Whereupon he consulted Mr. Wheeler, and told him of the unsuccessful attempt he had made. Mr. Wheeler proposed to suspend the conducting line by silk instead of pack-thread, as being smaller than the other. With this they succeeded perfectly well, but by repeated experiments they soon discovered that the silk refused to conduct the electric fluid, not on account of its smallness, as they had supposed, but on account of some difference in the matter. The wires were smaller than the silk thread, yet the electricity was effectually carried off by them. This discovery of the non-conducting power of silk was made in the beginning of July, 1729, and was quickly followed by another, viz. that the same power existed in many other substances: and thus, in fact, the foundation of almost all the subsequent improvements in electricity was laid. Not long after Mr. Grey's discovery of the difference between

conductors

conductors and non-conductors, Mr. Du Fay discovered the difference between positive and negative, or, as they were for some time, and are still by some called, the vitreous and resinous electricities. This discovery was accidentally made in consequence of his observing, that a piece of leaf gold, repelled by an excited glass tube, and which he meant to chase about the room with a piece of excited gun copal, instead of being repelled by it, as it was by the glass tube, was eagerly attracted. The same was the case with sealing-wax, sulphur, rosin, and many other substances. He discovered also, that it was impossible to excite a tube in which the air was condensed. Mr. Boze, professor of philosophy at Wittenburgh, re-introduced the use of glass globes; though some attribute this to Christian Augustus Hansen, professor of mathematics at Leipsic. He added also a prime conductor, which consisted of a tube of iron or tin. It was at first supported by a man standing upon cakes of rosin; but afterwards suspended by silk lines horizontally before the globe. A bundle of thread was put into the end next to the globe, which not only prevented any injury to the glass, but rendered the electricity stronger. "The number of electricians," says M. Cavallo, "that hath been daily multiplying since Mr. Grey, the discoveries made, and the use derived from those, till the present time, are matters really worthy of attention, and deserve to be admired by every lover of the sciences, and well-wisher of the human race. "Whoever would make himself acquainted" (adds he) "with the particular transactions concerning those advances, should read the elaborate History of Electricity compiled by the learned Dr. Priestley, a work that will inform him of whatever had been done relative to the subject till its publication. I shall, in general, only observe, that although the science had, through the indefatigable attention of so many ingenious persons, and by the discoveries daily produced, excited the curiosity of philosophers, and engaged their attention; yet, as the causes of any thing, whether small or great, known or unknown, are seldom much attended to, if their effects are not striking and singular; so electricity had, till the year 1746, been studied by none but philosophers. Its attraction could in part be imitated by a load-stone; its light by a phosphorus; and in short, nothing contributed to make electricity the subject of public attention, and excite a general curiosity, until the capital discovery of the vast accumulation of its power in what is commonly called the Leyden phial, which was accidentally made in the memorable year 1745. Then, and not till then, the study of electricity became general, surprised every beholder, and invited to the houses of electricians a greater number of spectators, than were before assembled together to behold any philosophical experiments whatever." He adds in a note, "This great discovery was made by M. Van Kleist, dean of the cathedral in Camin." The method of giving the electric shock, or the accumulation of the power of electricity in a phial, got its name of the Leyden phial, from Mr. Cunaus, a native of Leyden, who exhibited it in repeating some experiments made by Messrs. Muschenbroek and Allamand, professors in the university of that city. M. Van Kleist, sent the following account of his discovery to Dr. Lieberkuhn, at Berlin, on the 4th Nov. 1745. "When a nail, or a piece of thick brass wire, &c. is put into a small apothecary's vial, and electrified, remarkable effects follow: but the vial must be very dry, or warm. I commonly rub it over beforehand with a finger on which I put some pounded chalk. If a little mercury, or a few drops of spirit of wine, are put into it, the experiment succeeds the better. As soon as this phial and nail are removed from the electrifying glass, or the prime conductor to which it hath been exposed is taken away, it throws out a pencil of flame so long, that with this burning machine in my hand, I have taken above sixty steps in walking about my room. When it is electrified strongly, I can take it into another room, and there fire spirits of wine with it. If, while it is electrifying, I put my finger or a piece of gold which I had in my hand, to the nail, I receive a shock which stuns my arms and shoulders. "A tin tube, or a man placed upon electrics, is electrified much stronger by this means than in the common way. When I present this vial and nail to a tin tube, which I have fifteen feet long, nothing but experience can make a person believe how strongly it is electrified. Two thin glasses have been broken by the shock of it." Not long after this the following method of giving the shock was discovered in Holland by Mr. Cunaus. Mr. Muschenbroek and his friends, observing

that electrical bodies exposed to the atmosphere, which is always replete with conducting particles of various kinds, soon lost their electricity, and were capable of retaining but a small quantity of it; imagined, that, were the electrified bodies terminated on all sides by original electrics, they might be capable of receiving a stronger power and retaining it longer. Glass being the most convenient electric for this purpose, and water the most convenient non-electric, they first made these experiments with water in glass bottles: but no considerable discovery was made, till Mr. Cunaus, happening to hold his glass vessel in one hand, and endeavouring to disengage it from the conductor with the other, (when he imagined the water had received as much electricity as the machine could give it), was surprised with a sudden shock in his arms and breast, which he had not in the least expected. The report of such a terrible effect of the electric power immediately raised the attention of all the philosophers in Europe. Many of them greatly exaggerated their accounts; either from a natural timidity, or a love of the marvellous. M. Muschenbroek, who tried the experiment with a very thin glass bowl, told M. Reaumur in a letter wrote soon after the experiment, That he felt himself struck in his arms, shoulder, and breast, so that he lost his breath; and was two days before he recovered from the effects of the blow, and the terror. He added, that he would not take a 2d shock for the whole kingdom of France. One of the most important discoveries yet made in electricity is the identity of the electric fluid with lightning. From almost the first discovery of the electric light, and the crackling with which it is emitted, a similarity between it and the phenomena of thunder and lightning had been observed. This is taken notice of by Dr. Wall, one of the first who viewed the electric light in any perfect manner. The Abbé Nollet, Mr. Winckler, and others, also enumerated many resemblances between the phenomena of electricity and those of thunder; but they did not think of any method by which their suppositions could be brought to the test of experience. This was first proposed by Dr. Franklin in 1750. He had before discovered the effects of pointed bodies in drawing off the electric matter more powerfully than others. This was suggested to him by one Mr. Thomas Hopkinson, who electrified an iron ball 3 or 4 inches diameter with a needle fastened to it, expecting to draw a stronger spark from the point of it; but was surprised to find little or none. Dr. Franklin, improving on this hint, supposed that pointed rods of iron, fixed in the air when the atmosphere was loaded with lightning, might draw from it the matter of the thunder bolt, without noise or danger, into the body of the earth. "The electric fluid (said he) is attracted by points. We do not know whether this property be in lightning; but since they agree in all the particulars in which we can already compare them, it is not improbable, that they agree likewise in this; let the experiment be made." Dr. Franklin's supposition was verified in 1752, and the discovery is almost the only one in the whole science, that has not been the result of accident. The most active persons were two French gentlemen, Messrs. Dalibard and Delor. The former prepared his apparatus at Marly la Ville, 5 or 6 leagues from Paris; the latter at his own house, on some of the highest ground in that capital. M. Dalibard's machine consisted of an iron rod 40 feet long, the lower extremity of which was brought into a centry-box, where the rain could not come; while on the outside it was fastened to three wooden posts by long silken strings defended from the rain. This machine was the first that was favoured with a visit of the ethereal fire. Mr. Dalibard himself was not at home; but, in his absence, he had entrusted the care of his apparatus to one Coissier a joiner, who had served 14 years among the dragoons, and on whose courage and understanding he could depend. This artisan had all the necessary instructions given him; and was desired to call some of his neighbours, particularly the curate of the parish, whenever there should be any appearance of a thunder storm. At length the long expected event arrived. On Wednesday, 10th May, 1752, between two and three P. M. Coissier heard a pretty loud clap of thunder. Immediately he ran to the machine, taking with him a phial furnished with a brass wire; and presenting the wire to the end of the rod, a small spark issued from it with a snap like that which attends a spark from an electrified conductor. Stronger sparks were afterwards drawn in the presence of the curate and a number of other people. The curate's account of them was, that they were of a blue colour, an inch and an half in length, and smelled

smelled strongly of sulphur. In making them, he received a stroke on his arm a little below the elbow; but he could not tell whether it came from the brass wire inserted into the phial, or from the bar. He did not attend to it at the time; but the pain continuing, he uncovered his arm when he went home in the presence of Coissier. A mark was perceived round it, such as might have been made by a blow with the wire on his naked skin. Dr. Franklin himself had an opportunity, about a month after this, of verifying his own hypothesis. He was waiting for the erection of a spire in Philadelphia, not imagining that a pointed rod of a moderate height could answer the purpose. At last it occurred to him; that by means of a common kite he could have a readier access to the higher regions of the atmosphere than any other way whatever. Preparing, therefore, a large silk handkerchief and two cross sticks of a proper length on which to extend it, he took the opportunity of the first approaching thunder-storm to take a walk into a field where there was a shed convenient for his purpose. But dreading the ridicule which too commonly attends unsuccessful attempts in science, he communicated his intention to nobody but his son, who assisted him in raising the kite. A considerable time elapsed before there was any appearance of success. One very promising cloud had passed over the kite without any effect; when just as he was beginning to despair, he observed some loose threads of the hempen string to stand erect and avoid one another, just as if they had been suspended by the conductor of a common electrical machine. On this he presented his knuckle to a key which was fastened to the string, and thus obtained a very evident electric spark. Others succeeded even before the string was wet; but when the rain had begun to descend, he collected electric fire pretty copiously. He had afterwards an insulated iron rod to draw the lightning into his house; and performed almost every experiment with real lightning, that had before been done with the artificial representations of it by electrical machines. A new and extensive field was thus opened for philosophers; but it was soon found, that experiments of this kind were attended with danger. In 1752, the Abbé Nollet published some cautions to those who tried experiments on lightning. He had been informed by letters from Florence and Bologna, that some persons in these places had received violent shocks, while they drew sparks from an iron bar electrified by lightning. A correspondent informed him, that once, as he was endeavouring to fasten a small chain, with a copper ball at one of its extremities, to a great chain which communicated with the bar at the top of the building, there came a flash of lightning which he did not see, but which affected the chain with a noise like that of wild-fire. The observer instantly received such a shock, that the ball fell out of his hands, and he was struck backwards four or five paces. But the most melancholy proof of the danger of these experiments, was the death of professor Richman, at Petersburg. This happened on the 6th Aug. 1753, as he was making experiments on lightning drawn into his own room. He had provided himself with an instrument for measuring the quantity of electricity communicated to his apparatus; and as he stood with his head inclined to it, Mr. Solokow an engraver, who was near him, observed a globe of blue fire, as big as his fist, jump from the instrument, which was about a foot distant, to Mr. Richman's head. The professor was instantly dead, and Mr. Solokow was also much hurt. The latter, however, could give no particular account of the way in which he was affected; for, at the time the professor was struck, there arose a sort of steam or vapour, which entirely benumbed him, and made him sink down to the ground; so that he could not even remember to have heard the clap of thunder, which was a very loud one. The globe of fire was attended with an explosion like that of a pistol; the instrument for measuring the electricity (called by the professor an electrical gnomon) was broken to pieces, and the fragments thrown about the room. Upon examining the effects of the lightning in the professor's chamber, they found the door-case half split through, and the door torn off and thrown into the room. A vein was opened in the body twice, but no blood followed; after which, they endeavoured to recover life by violent friction, but in vain: upon turning the corpse with the face downwards during the rubbing, an inconsiderable quantity of blood ran out of the mouth. There appeared a red spot on the forehead, from which spirted some drops of blood through the pores, without wounding the skin. The shoe belonging to the left foot was

burst open, and uncovering the foot at that part, they found a blue mark: whence it was concluded, that the electric matter having entered at the head made its way out again at that foot. Upon the body, particularly on the left side, were several red and blue spots resembling leather shrunk by being burnt. Many more also became visible over the whole body, and particularly over the back. That upon the forehead changed to a brownish red, but the hair of the head was not singed. In the place where the shoe was unripped, the stocking was entire; as was the coat every where, the waistcoat only being singed on the fore flap where it joined the hinder; but there appeared on the back of Mr. Solokow's coat long narrow streaks, as if red-hot wires had burned off the nap, and which could not well be accounted for. Next day, when the professor's body was opened, the cranium was very entire, having neither fissure nor contra-fissure: the brain was sound; but the transparent pellicles of the wind-pipe were excessively tender, and easily rent. There was some extravasated blood in it, as also in the cavities below the lungs. Those of the breast were quite sound; but those towards the back of a brownish black colour, and filled with more of the blood above-mentioned. The throat, the glands, and the small intestines, were all inflamed. The singed leather-coloured spots penetrated the skin only. In 48 hours the body was so much corrupted that they could scarce get it into a coffin. Since the discovery of the identity of lightning and the electric matter, long rods of iron or other metal have been made use of with a view to protect buildings from the danger or strokes of lightning. A considerable dispute has been carried on whether these rods ought to be pointed or not; but a committee of the Royal Society lately determined it in favour of the former.

EXPLANATION OF TERMS USED IN ELECTRICITY.

ELECTRIC FLUID. On rubbing glass, sealing-wax, sulphur, and several other bodies, with flannel or other proper rubber, and presenting the hand, or any other part of the body to the substance so rubbed; a fluid passing between the rubbed body, and the part presented is sensibly felt. This fluid has a sulphureous smell, and is rendered visible by its luminous appearance especially in the dark. The fluid thus exhibited has received the name of the electric, or electrical fluid.

ELECTRICAL APPEARANCES. It has been known for ages, that amber, jet, and some other bodies, when rubbed, attract and repel light bodies, as hairs, feathers, down, dust, &c. In more modern times, it was discovered, that glass, resins, silk, dry wood, &c. have the same properties; and that any of these, when dry, and rubbed for a short time, would attract light substances very readily. On darkening the room, and rubbing the glass tube again, sparks of fire will follow the hand; present a finger to the tube, at the distance of half an inch, and these sparks will be formed into pencils or brushes of light attended with a snapping noise. By varying the experiments other effects of the electric fluid will be perceived. The attraction, repulsion, sparkling, &c. are termed signs of electricity, or electrical appearances.

RUBBERS. The substance that rubs the electric to produce the electrical appearances, is termed the rubber. The rubber makes an essential part of the construction of an electrical machine.

EXCITATION. Those bodies, which by rubbing are made to exhibit electrical appearances, are said to be excited by the friction or rubbing.

ELECTRICS. Those bodies which can be excited, or made to produce the electrical appearances, are called electrics, and frequently electrics *per se*.

NON-ELECTRICS. Those which cannot be excited, are called non-electrics.

CONDUCTORS. It is found that some bodies admit the fluid to pass through them on which account they are called conductors. This property belongs principally to the non-electrics; hence the terms conductor and non-electric are nearly synonymous.

NON-CONDUCTORS. It is found that some bodies do not admit or with difficulty admit the fluid to pass through them, and these are called non-conductors. This property belongs principally to the electrics, hence the terms non-conductor and electric are nearly synonymous.

INSULATION. When a body is placed entirely upon non-conductors, it is said to be insulated. Insulation prevents the dissipation of the electric fluid, through the surrounding bodies. A per-

son is said to be insulated, when he is set with his feet upon a cake of resin, or on a stool with glass feet, or any other good electric, so that the communication between his body and the earth may be thereby cut off.

ELECTRIFICATION. Any body, to which the power of attraction and repulsion, &c. is communicated, is said to be electrified.

OF CONDUCTORS AND NON-CONDUCTORS.

One of the first principles in electricity is, that all the substances in nature are either electrics or conductors. Numberless experiments prove that a substance which is a conductor cannot be excited; and on the other hand, that a substance which can be excited is not a conductor. This law, however, must not be taken in an absolute sense; for, strictly speaking, there is no substance in nature that can be justly stiled a perfect electric, or a perfect conductor. In the best conductors the electric fluid finds some resistance; and it is partially transmitted through or along the surface of most, if not all electrics. These two classes so far approach each other's limits, that the less perfect conductors may be excited, and even some that are pretty good conductors. We insert the following lists of electrics and conductors, in the order of their perfection, as they are classed by Mr. Cavallo, who begins with the most perfect in each:

ELECTRICS. 1. Glass and all vitrifications whatever. 2. Precious stones; of which the most transparent are the best. 3. All resins and resinous compounds; or such consistent oily vegetable productions, as are inflammable, and not soluble in water. 4. Amber. 5. Sulphur. 6. Baked wood. 7. Bituminous substances. 8. Wax. 9. Silk. 10. Cotton. 11. Feathers, wool, hair, and all other dry animal substances. 12. Paper. 13. White sugar and sugar-candy. 14. Air. 15. Oils. 16. Metallic calces. 17. Ashes of animal and vegetable substances. 18. All dry vegetable substances. 19. All hard stoves. Many of these, when very hot, lose their electric property and become conductors; as red hot glass, melted resin, hot air, &c. The best vitrified glass also sometimes becomes a conductor.

CONDUCTORS. 1. Gold. 2. Silver. 3. Copper. 4. Brass. 5. Iron. 6. Tin. 7. Quick-silver. 8. Lead. 9. Semi-metals. 10. Metallic ores. 11. Charcoal, of animal or vegetable substances. 12. Fluids of animal bodies. 13. All other fluids, except air and oils. 14. The effluvia of flaming bodies. 15. Ice. 16. Snow. 17. Metallic salts, and most other saline substances. 18. Stony substances. 19. Smoke. 20. Steam. Electricity also pervades the vacuum made by an air-pump. Green vegetables, raw meat, &c. are rendered conductors by the fluids they contain. Hence all electrics before excitation should be well dried, and some even heated, to free them from every particle of dampness, otherwise they may act as conductors. We cannot close this part of our subject, without taking notice of the changes made in the same substance by different preparations. A piece of wood just cut from a tree is a good conductor: bake it and it will become an electric: burn it to charcoal, and it is a good conductor again; reduce it to ashes, and these will be found electrics. Similar changes are observable in many other bodies.

OF POSITIVE AND NEGATIVE ELECTRICITY.

If a fine downy feather, or any light body, be tied to a silk thread, and electrified strongly, by touching it with the excited glass tube, it immediately flies from, or is repelled by, the glass tube. If we now present an excited stick of sealing-wax, the feather immediately flies towards it. Thus what was attracted by excited wax, is repelled by excited glass. This experiment has given rise to a very important distinction in electricity, implying a contrariety of agency. Let two light balls formed of cork, or the pith of elder, be suspended by fine linen threads from small cylinders of wood, and insulated upon a common wine glass, that is wiped dry, and free from dust. Upon electrifying the two balls, thus suspended, by excited glass, they will repel each other; but we may destroy this electricity only by touching them with the finger. If again we electrify them, but with excited wax, they will again repel each other. But bring the balls electrified by wax towards those electrified by glass, and they immediately fly towards each other. From these and similar experiments, the two electricities were at first specifically distinguished by the names of Vitreous and Resinous. That which was thought to be

the constant production of rubbed glass, was stiled the **VITREOUS ELECTRICITY**; and that which was first observed to be produced by wax and other resinous substances was denominated the **RESINOUS ELECTRICITY**. But the vitreous, for reasons which will afterwards appear, is now called by the best electricians, **POSITIVE** or **PLUS ELECTRICITY**, and the resinous is denominated **NEGATIVE** or **MINUS ELECTRICITY**. Let a person be insulated upon any good electric, holding a dry glass tube in his left hand, and rubbing it with his right: both the person and the tube will be quickly electrified. If feathers, thread, bits of paper, or any other light substances, be presented to his body, they will be attracted and repelled. If another person presents his finger to him, a spark of light will follow the finger with a slight snapping noise. In a word he will exhibit every electrical appearance that the tube does. Yet the electricity of the person and that of the tube, are quite the opposite of each other; the one attracting what the other repels. Thus if a small piece of cork or any other light body, insulated or suspended by a silk thread, has been attracted and repelled by the glass tube, if no conducting substance come in contact with it in this state, it will not again be attracted by the tube. The same happens with the insulated person: if the light substance has been attracted and afterwards repelled by his body, it will not be again attracted. If, however, in this state of repulsion, the tube be presented to this light substance, it will be attracted violently by the tube; and when repelled by the tube, it will be again attracted by the insulated person. If two or more of these light insulated bodies be separately attracted by the tube, and when repelled brought near each other, they will repel each other, and continue in this electrified and repulsive state for some time. The same will happen if they be presented to the insulated person; after which they will likewise repel each other. But if one or more of them be attracted and repelled by the glass tube, and one or more others by the person, and afterwards all of them be brought near each other, they will then mutually attract instead of repelling each other; and instead of remaining in an electrified state, they will extinguish every appearance of electricity. These two electricities, therefore, appear to be the opposites of each other, and as if the one was an affirmative or positive power, and the other a negative, they balance each other, and lose every electrical property and appearance. There is another characteristic difference between them too, in the appearance of their light. If a needle, a wire, or any other pointed body, be presented to the excited tube in the dark, a small lucid globe, resembling a star, will be seen upon the point; but if the needle, or wire, be presented to the person, a lucid pencil of rays will appear issuing from the point, and diverging towards the person. These rays appear best when the needle is presented to the person, one inch from his body, while he is rubbing the tube. Another characteristic difference has been observed in some experiments. The electricity of the tube, when in the act of passing from a body overcharged with it to another, either not electrified, or possessed of the contrary electricity, shews an indisputable current from the former to the latter; and the electricity of the insulated person, when in the act of passing from a body overcharged with it to another, either not electrified, or possessed of the contrary electricity, shews clearly a current from the latter to the former. These two electricities are not only observed in the above-mentioned experiment, but in several other cases also; and they always accompany each other; for when different electrics are rubbed, some will acquire one electricity, and others will acquire the contrary; the rubber, if insulated, shewing at the same time signs of the electricity contrary to that acquired by the excited electric: besides this, almost all electrics may be made to shew at pleasure the one or the other electricity, according to the substance used for a rubber. Hence the following corollaries may be deduced; viz. 1. Whenever two different substances (being both insulated, or only that which is a conductor) are rubbed together, except they are both equally good conductors, they will be both electrified, and one acquire the electricity contrary to the electricity of the other. 2. Almost all the electrics may be made to acquire, at pleasure, the one or the other electricity by using proper rubbers. Many causes operate to produce a difference in the electricity. Often the same electric, rubbed with the same rubber, exhibits at one time signs of positive and at another of negative electricity. A slight variation in the surface, or in the degree of dryness, or a

different

different application of the same substance, often causes this difference. It appears from many experiments, that when two different substances are rubbed together, that whose surface is roughest, or whose electric power is strongest, generally acquires the positive, and the other the negative. And if two electrics every way equal are rubbed together, the substance, which suffers the greatest friction, acquires the negative electricity, and the other

the positive. We here present the ingenious with Mr. Cavallo's Table, which exhibits at one view what kind of electricity will be excited in the best electric by rubbing with different substances. "It might have been much extended, (he says) had he chosen to bring into it all the minutiae as far as is known. But this he thought both unnecessary and impracticable."

TABLE SHEWING THE KINDS OF ELECTRICITY EXCITED IN SOME ELECTRICS BY VARIOUS SUBSTANCES.

<i>Electrics rubbed.</i>	<i>Electricities.</i>	<i>Substances used as rubbers.</i>
The back of a cat.....	Positive	Every substance with which it has been hitherto tried.
Smooth glass.....	Positive	Every substance hitherto tried, except the back of a cat.
Rough glass.....	{ Positive	Dry oiled silk, sulphur, metals.
	{ Negative	Woollen cloth, quills, wood, paper, sealing-wax, white wax, the human hand.
Tourmalin.....	{ Positive	Amber, air blown with a pair of bellows.
	{ Negative	Diamond, the human hand.
Hare's skin.....	{ Positive	Metals, silk, loadstone, leather, hand, paper, baked wood.
	{ Negative	Other fine furs.
White silk.....	{ Positive	Black silk, metals, black cloth.
	{ Negative	Paper, hand, hairs, weasel's skin.
Black silk.....	{ Positive	Sealing-wax.
	{ Negative	Hare's, weasel's, and ferret's skin, loadstone, brass, silver, iron, hand.
Sealing-wax.....	{ Positive	Metals.
	{ Negative	Hare's, weasel's, and ferret's skin, hand, leather, woollen, cloth, paper.
Baked wood.....	{ Positive	Silk.
	{ Negative	Flannel.

OF THE EXCITATION OF ELECTRICS.

It is a well known law in electricity, that all electric substances may be excited by friction or rubbing. This, however, is not the only method of exciting electrics to exhibit electrical appearances. Several electrics are excited by melting or pouring a melted electric into another substance; by heating or cooling; and by evaporation or effervescence. These methods are attended with peculiar phenomena. Sulphur, melted in an earthen vessel, and left to cool upon conductors, is found strongly electrical; but not at all when left to cool upon electrics. If melted in a glass vessel and left to cool, both the glass and the sulphur acquire a high degree of electricity; the former positive and the latter negative, whether left to cool upon electrics or conductors. And it is remarkable that the sulphur acquires no electricity till it begins to cool. Melted sulphur poured into a vessel of baked wood, acquires a negative electricity, while the wood acquires a positive: but when poured into rough glass, or sulphur, it shews none. Sulphur melted, and poured into a metal cup, and there left to cool, exhibits no electrical appearances whilst in the cup; but if they be separated both will appear strongly electrified; the sulphur plus and the cup minus. Upon replacing the sulphur in the cup, every electrical sign vanishes; but if, while separate, the electricity of either be withdrawn, they will both appear possessed of the other electricity, on being replaced. Melted wax, poured into wood or glass, acquires a negative electricity, and leaves the glass or wood positive. Sealing-wax, poured into sulphur, acquires a positive electricity, and leaves the sulphur negative. If a stick of sealing-wax be broken in two pieces, the extremities that were joined will be electrified, the one positively, the other negatively. The late Mr. W. Henly, F. R. S. discovered, that chocolate fresh from the mill, becomes strongly electrical, as it cools in the tin pans. It soon loses this property, but recovers it once or twice, by being melted in an iron ladle and poured into the tin pans. When the mass becomes dry, the electricity cannot be restored by melting, unless olive oil be mixed with it in the ladle; in which case it completely recovers its electric power. The Tourmalin, or lapis electricus of Linnaeus, a hard semi-pellucid fossil, was first observed to exhibit electrical phenomena, by heating and cooling. This stone is common in the East Indies, and possesses many singular electrical properties. It exhibits, however, no electrical appearances, while kept in an equal temperature; but by increasing its heat, it becomes electrical, and still more so by diminishing it. Its electricity appears, not over its whole surface, but only on two opposite sides, which have been stiled its poles, as they are in

a line with its centre, and in the same direction with its strata; in which direction it is opaque, though semi-transparent in the other. The tourmalin, while heating, has one of its sides electrified positively, and the other negatively; but while cooling, the former becomes negative and the latter positive. If heated and allowed to cool without either side being touched, the former will be positive and the latter negative, all the time it is heating or cooling. If excited by rubbing, each of its sides, or both at once may be rendered positive. If heated or cooled upon an insulated substance, that substance will become possessed of the electricity contrary to that of the side of the tourmalin, which was laid on it. The electricity of both sides, or of either, may be reversed by heating or cooling the stone, in contact with other bodies. If a tourmalin be cut in pieces, each piece will have its positive and negative poles, as well as the whole stone. All the above properties are observable in vacuo. If this stone be covered over with wax, oil, or any similar electric, it will exhibit the same electric signs, as without the covering. Mr. William Canton remarked a vivid light upon this stone, while heating in the dark, by which he could determine which end of the tourmalin was positive or negative. When excited, it emits very strong flashes in the dark, from the positive to the negative end. Mr. Canton has also observed the Brazilian emerald emit light while heating in the dark. Mr. Cavallo "imagines that every other precious stone will shew it, if its electric power be sufficiently strong; since the light is a consequence of the passage of a sufficient quantity of electricity through the air, or other partly resisting medium." The electrical power of the tourmalin is sometimes improved, sometimes injured, sometimes not in the least affected, by a strong fire. Most of the above properties, which were supposed to be peculiar to the tourmalin, are possessed by several hard precious stones, which are capable of becoming electrical by heating and cooling, and have their positive and negative sides lying in the direction of their strata, &c. The method of exciting electricity by evaporation was lately discovered by Mr. Volta; who observed that the evaporation of water, and some other fluids, as well as certain effervescences, generated electricity. His experiments seem to prove, that fluids, or other bodies reduced to vapour, become electrified positively, and leave the bodies from which they evaporated, electrified negatively; and that on the other hand, when the vapours are condensed into a fluid, they become electrified negatively, and leave the bodies with which they were last in contact electrified positively.

OF COMMUNICATED ELECTRICITY.

"Under the title of communicated electricity, (says M. Cavallo) falls

falls almost all that is known of the subject; the passage of this virtue from one body to another is what causes its light; by being communicated to other bodies, we see its attraction; by its quick transition it melts metals, destroys animal and vegetable life; and in short it is by this communication, that the science is at all known and cultivated." When electricity is induced on a body, it is confined there by electrics alone; and for a longer or shorter time as these are more or less perfect. A glass tube rubbed acquires a quantity of electricity, which remains, in the glass, because it is surrounded by the air, which is an electric. But as the air is never a perfect electric, the glass tube cannot retain the electrical virtue perpetually, but only for a longer or shorter time, as the air happens to be in a more or less perfect electric state. It therefore imparts some of this virtue to the air, or to the conducting particles in it, gradually, till it loses it altogether. A finger or any other conductor presented to an excited electric, will receive a greater or less part of its electricity; but cannot receive the whole because the excited electric, being a non-conductor, cannot convey all its electricity to that side to which the conductor has been applied. Hence a conductor, presented to different parts of an excited electric, will receive at every approach a spark, without repeating the excitation, till the whole power excited is exhausted. When a conductor which communicates with the earth, is exhibited to an excited electric, at a proper distance, it acquires an electricity, on that side, contrary to that of the electric, and which increases the nearer they approach, till by the eager attraction between the two electricities, the conductor receives a spark from the electric, and thus the equilibrium is restored. If the conductor be insulated, both sides will appear electrified, but with different electricities: the side next the electric having acquired the electricity contrary to that of the electric, and the opposite side one of the same kind. These electricities increase as the conductor approaches the electric, but upon receiving the spark, the electricity of the conductor becomes the same with that of the electric throughout. All these effects are similar, though some other electric, as glass, rosin, wax, &c. be interposed between the excited electrics and the conductor; for the spark forces through the interposed electric, as it always does through the air, when it causes the snapping noise, that attends it. When an insulated conductor has received the electricity from an excited electric, it is said to be electrified by communication. It then acts like the excited electric; excepting that when touched by another conductor, that communicates with the earth, it discharges its whole surplus of electricity at once. The reason is, because the electricity belonging to the whole of the conductor is easily communicated through its own substance to the other conductor. Hence the electricity discharged from an electrified conductor is much more powerful than that discharged from an electric. If an insulated conductor be touched with another electrified conductor, it will acquire part of its electricity, and each will shew signs of it. It will not, however, be equally divided between them, unless they are equal in respect to their surfaces and situations. The quantity of electricity in each will be in proportion to their surfaces, and not to the quantity of matter in each. Mr. Cavallo; specifies these proportions very accurately in his *Complete Treatise*, vol. i. p. 40, 41. Edit. 4th. The distance to which an electric spark will go through the air, to reach a conductor, is in proportion to its quantity of electricity, the perfection of the conductor, and to the sharpness of the parts from which it flies off, and on which it strikes. The noise attending it also is in proportion to all these. A sharp-pointed body will throw off the electricity to, and receive it from, a greater distance, than a body of any other shape, but the communication is attended with little light and no noise, as the electricity comes by little and little, not in a large body. A current of air is sensibly felt in these cases at an electrified point, and always in the direction of the point. An electric spark, taken upon any part of a living body, occasions a disagreeable sensation, and more or less so in proportion to the strength of the spark. Electricity strongly communicated to insulated animal bodies, quickens the pulse and promotes perspiration. If the face or any part of the body be presented to an excited electric, or an electrified conductor, it will feel as if a wind was blowing, or rather a spider's web drawn over it. If an excited electric is presented to the nose, a smell will be perceived like that of phosphorus; but communicated electricity does not occasion any such sensation, unless a large quantity passes suddenly

from one body to another. A pretty large quantity of electricity pervades a long conductor with an astonishing, though imperceptible velocity, but a small quantity takes more time. Substances possessed of the same electricity repel, and those possessed of the opposite electricities attract each other. There is no electric attraction but between bodies possessed of different electricities; nor any electrical repulsion but between those possessed of the same electricity. Electricity communicated to insulated fruits, fluids, and other bodies in a state of evaporation, increases that evaporation. Electricity promotes vegetation by increasing the perspiration of vegetables. Plants often and long electrified, have shewn a more lively appearance than others that were not. Mr. Koestlin, however, says, that negative electrization retards both animal and vegetable life. When electricity is communicated to insulated vessels containing water that is running from a pipe, the electrified stream is but little accelerated, unless the tube be capillary, in which it is accelerated with an impetuosity and velocity, which is increased in proportion to the smallness of the tube. The electric power is neither affected by heat nor cold, for an iron bar made red hot, and any conducting fluid hard frozen, when electrified, exhibit sparks, attract or repel nearly as well as in their natural temperature. And it neither affects, nor is affected by the magnet. Electricity can be communicated to electrics, although it is done with difficulty, as their substance is impervious to it in a great degree. To make an electric acquire electricity, it must be touched several times, and in different parts, with the electrified body.

OF CHARGED ELECTRICS, AND PARTICULARLY OF THE LEYDEN PHIAL.

"If to one side of an electric (says M. Cavallo) sufficiently thin, as for instance a pane of common window glass, a plate of sealing-wax, &c. be communicated one electricity, and to the opposite side the contrary, that plate in that case is said to be charged; and the two electricities can never come together, except a communication of conducting substances be made between both sides, or the electric be broken by the power of electric attraction. When the two electricities of a charged electric are by any means united, and therefore their power destroyed, that electric is then said to be discharged, and the act of union of these two opposite powers is called the electric shock. "To avoid the difficulty of communicating electricity to an electric plate, it is customary to coat the sides of it with some conducting substance, as tin-foil, gilt paper, &c. by which means the charging and discharging becomes very easy; for when the electricity is communicated to one part of the coating, it is immediately spread through all the parts of the electric that are in contact with that coating; and when the electric is to be discharged, it is sufficient to make a conducting communication between the coatings of both sides, to discharge entirely the electricities of that electric." He adds, that "the coatings of both sides of an electric should not come very near one another towards the edge of the plate; for although they do not absolutely touch one another, yet when they are electrified, the electricity will easily force a passage through the air, and by passing over the surface of the electric, from one coating to the other, render it incapable of receiving any charge." It is by means of charged electrics, that we become acquainted with the greatest powers of electricity, as we can accumulate these powers, and use them in various experiments with advantage. If a glass plate be properly coated on both sides with a conducting substance, and if to one of these coatings be communicated some electricity, the other coating, while communicating with the earth, or with a sufficient quantity of conducting bodies, acquires by itself an equal quantity of the contrary electricity; but if, while one side is acquiring electricity, the opposite side does not communicate with the earth, or the conducting substances, the glass cannot be charged. The reason why, while one side of the glass receives the one electricity, the opposite side acquires the other, is, the property of bodies to acquire an electricity, contrary to that possessed by a contiguous electrified body; and the cause that hinders these two electricities from mixing, is the attraction between the glass plate and the fluid. It is of little consequence of what form the charged electric or Leyden jar be, provided the glass be sufficiently thin. "The thinner it is, (says M. Cavallo,) the greater charge it is capable of receiving; for the stronger in proportion is the power of the electricity of one side, to cause a contrary

contrary electricity on the opposite side. How thick a glass plate should be to become incapable of being charged, hath not yet been determined."

OF ATMOSPHERICAL ELECTRICITY, AND ITS EFFECTS; PARTICULARLY LIGHTNING.

ELECTRICITY is not only to be observed by rubbing an electric or warming a tourmaline, but has been found to be widely diffused through the atmosphere. It has been discovered that the air, the clouds, and even the rain, contain it; and that thunder and lightning, the aurora borealis, meteors, &c. are among its various and astonishing effects. The great similarity between lightning and the electric fluid had been for some time remarked by philosophers, particularly by the Abbé Nollet; but it was not suspected that they were the effects of the same cause, much less that the phenomena of lightning could be imitated by electricity, and those of electricity by lightning, till the celebrated Dr. Franklin hazarded the bold assertion, and advised the experiment to be made, and till he and the French philosophers proved the fact in 1752. Indeed, all the wonderful phenomena exhibited by electricians are only imitations on a small scale of those great effects which astonish and alarm us; and they depend upon the same mechanism. The same properties, and zig-zag sparks, their similar action on conducting substances, the power of rending, inflaming, and dispersing in every direction the substances on which lightning acts with power, the giving polarity to ferruginous matter, &c. all concur to shew their identity. But independent of these similarities, the fact is proved by the plainest and clearest evidence; when the atmosphere is charged with thunder clouds, we can by an electrical kite draw from it the matter of lightning, and with this matter perform every electrical experiment with which we are acquainted. There is not indeed a single phenomenon of the one, but may be imitated by the other. Lightning destroys edifices, trees, and animals; it goes through the best conductors that it meets within its course, and if its passage be obstructed by electrics, or less perfect conductors, it rends them, tears them to pieces, and disperses them in all directions. Lightning melts metals, and burns inflammable substances, &c. all of which effects can be produced by electricity. The air at some distance from houses, trees, masts of ships, &c. is commonly electrified positively, especially in frosty and clear weather. It is also electrified in foggy weather. "Clouds as well as rain, snow, and hail, says Mr. Cavallo, are almost constantly electrified, but oftener negatively than positively. How they come to be so, is not yet clearly ascertained, unless upon the principle of electricity produced by evaporation and condensation of lightning is the effect of their electricity, which darting from a cloud, or a number of clouds, highly electrified, strikes into another cloud, or upon the earth; preferring the most lofty and pointed places, and thus producing all those dreadful effects which are known to be occasioned by it," and of which it may not be improper to give a description, with an instance or two. When lightning is accompanied with thunder, it is well defined, and has generally a zig-zag form; sometimes it only makes one angle like the letter V, sometimes it appears like the arch of a circle. But the most formidable and destructive form which lightning is ever known to assume, is that of balls of fire. The motion of these is very often perceptible to the eye; but wherever they fall, much mischief is the result of their explosion. The next to this, in its destructive effects, is the zig-zag kind; for that species, whose flashes are indistinct, and whose form cannot easily be observed, is seldom known to do much hurt. The colour of lightning is also an indication of its power to do mischief, the palest and brightest flashes being most destructive in their effects. The zig-zag kind of lightning, when near, is remarkable for a kind of omnipresent property. If two persons be standing in a room, looking different ways, and a loud clap of thunder happens, accompanied with the zig-zag lightning, they will both distinctly see the flash, not only by that indistinct kind of illumination of the atmosphere, which is occasioned by fire of any kind, but the very form of the lightning itself, and every angle it makes in its course will be as distinctly perceptible, as though they had looked directly at the cloud from whence they proceeded. If a person happened at that time to be reading, he would distinctly see the form of the lightning between himself and the book. Lightning usually confines its effects to a small space; seldom exhibiting phenomena like those which ac-

company explosions of gunpowder, or of inflammable air in mines. Instances, however, of terrible explosions have occurred. The following is perhaps one of the most remarkable; "August 2, 1763, about six in the evening, there arose at Anderlight, about a league from Brussels, a conflict of several winds born upon a thick fog. This conflict lasted four or five minutes, and was attended with a frightful hissing noise, which could be compared to nothing but the yellings of an infinite number of wild beasts. The cloud then opening, discovered a kind of very bright lightning, and in an instant the roofs of one side of the houses were carried off and dispersed at a distance; above 1000 large trees were broke off, some near the ground, others near the top, some torn up by the roots; and many of the branches and tops carried to the distance of 60, 100, or 120 paces. Whole coppices were laid down, as corn is by ordinary winds; and the glass of the windows, situated near the spot, was shivered to atoms." It is not unusual for thunderstorms to produce most violent whirlwinds, such as are by some philosophers attributed to electricity; nay, even to occasion an agitation in the waters of the ocean itself; and all this too after the thunder and lightning has ceased. Of this the following instance happened at Great Malvern, October 26, 1761: at a quarter past four in the afternoon, the people were surprised with a most shocking and dismal noise; 100 forges, all at work at once, could scarce equal it. Upon the side of the hill, about 400 yards to the S. W. there appeared a prodigious smoke, attended with the same violent noise, as if a volcano had burst out of the hill; it soon descended, and passed on within about 100 yards of the south end of the house; it seemed to rise again in the meadow just below it, and continued its progress to the east, rising in the same manner for four different times, attended with the same dismal noise as at first; the air being filled with a nauseous and sulphureous smell. It gradually decreased till it was quite extinguished in a turnip field, about a quarter of a mile below the house; the turnip leaves, with leaves of trees, dirt, sticks, &c. filled the air, and flew higher than any of the hills. The thunder ceased before this happened, and the air soon afterwards became calm and serene." After the identity of lightning and the electric fluid was discovered, electricians began to describe other phenomena, formerly unaccounted for, to atmospherical electricity. Among these the aurora borealis was naturally, and with reason, ascribed to this cause. See AURORA BOREALIS. This conclusion was drawn not only from the imitation of its light by the electrical spark, but also from the observation, that the aurora borealis, when very strong, has been known to disturb the polarity of the magnetic needle. (See Phil. Trans. vol. lxx. p. 88.) The late Mr. Canton made several experiments in confirmation of this idea, by collecting considerable quantities of the electric fluid, during the time of an aurora borealis. His apparatus was very simple; it consisted of an insulated fishing-rod, with a wire twisted round it, erected on the top of his house. From his experiments performed with the atmospherical electrometer, and the electrometer for the rain, Mr. Cavallo deduces the following conclusions, respecting the electricity of the atmosphere:

"I. That there is in the atmosphere, at all times, a quantity of electricity; for whenever I use the above-mentioned instrument, it always acquires some electricity.

"II. That the electricity of the atmosphere, or fogs, is always of the same kind, namely, positive; for the electrometer is always negative, except when it is evidently influenced by heavy clouds near the zenith.

"III. That, in general, the strongest electricity is observable in thick fogs, and also in frosty weather; and the weakest, when it is cloudy, warm, and very near raining; but it does not seem to be less by night than in the day.

"IV. That in a more elevated place the electricity is stronger than in a lower one; for having tried the atmospherical electrometer both in the stone and iron gallery on the cupola of St. Paul's cathedral, I found that the balls diverged much more in the latter, than in the former less elevated place. Hence it appears, that if this rule takes place at any distance from the earth, the electricity in the upper regions of the atmosphere must be exceedingly strong."

OF THE ADVANTAGES DERIVED FROM ELECTRICITY.

Under this head, to which M. Cavallo devotes a whole chapter of his excellent treatise, he observes, that "besides the field that

electricity has opened for farther discoveries, and for the satisfaction of that curiosity, which before attended the contemplation of so many wonderful phenomena as have been explained by this science, there are two great advantages derived from electricity; the one is a defence against the direful effects of lightning, and the other a remedy for many disorders incident to the human body. 'In order to guard edifices or ships from being damaged by lightning, it was judiciously proposed by Dr. Franklin, to raise a metallic conductor some feet above the highest part of the building, and continue it down the wall till it penetrated some feet into the ground; by this means the house could never receive any damage; for whenever the lightning should happen to fall upon it, it is evident that the conductor, being of metal, and higher than any part of the building, would certainly attract it, and, by conducting it to the ground, hinder that building from receiving any damage; it being well known that electricity always strikes the nearest and best conductors that it meets within its way. 'The reasonableness and truth of this assertion has been confirmed by numberless facts, and the practice of raising such conductors has been found exceedingly useful, particularly in hot climates, where thunder-storms are very frequent, and the damages occasioned by the same, too often experienced. In regard to the construction of such conductors, there have been some controversies among electricians; and the most advantageous manner of using them has not, without a great many experiments, and but very lately, been ascertained. Some philosophers have asserted, that such conductors should terminate in a blunt end, that they might the less invite the lightning from the clouds; for a blunt end will not attract electricity from so great a distance as a sharp point. But other philosophers have thought a pointed termination to be much preferable to a blunt one; and their assertion seems, on the following accounts, founded on much better reasoning. A sharp-pointed conductor, it is true, will attract electricity from a greater distance than a blunt one, but at the same time will attract and conduct it by little and little, or rather by a continued stream, in which manner a remarkably small conductor is capable of conducting a very great quantity of electricity; whereas a blunt terminated conductor attracts the electricity in a full separate body or explosion, in which manner it is often made red hot, melted, and even exploded in smoke, and by such a quantity of electricity as perhaps would not have at all affected it, if it had been sharply pointed. A sharp-pointed conductor certainly invites the matter of lightning easier than a blunt one; but to invite, receive, and conduct it in small quantities, never endangers the conductor: and the object of fixing a conductor to a house, is to protect the house from the effects of, and not the conductor from transmitting the lightning. It is an observation much in favour of sharp-pointed conductors, that such steeples of churches, and edifices in general, as are terminated by pointed metallic ornaments, have very seldom been known to be struck by lightning; whereas others that have flat or blunt terminations, and have a great quantity of metal in a manner insulated on their tops, are often struck by it, and it is but seldom that they escape without great damage. However, it happened not long ago, that a building furnished with many sharp conductors was struck by lightning. Besides these considerations, a sharp-pointed conductor, by the same property of attracting electricity more than a blunt one, may actually prevent a stroke of lightning, to do which a blunt-ended one is absolutely incapable. For an edifice of a moderate size, one conductor is perhaps sufficient; but, in order to secure a large building from sustaining any damage by lightning, there should be two, three, or more, conductors, in proportion to the extent of the building. In ships a chain has often been used for this purpose, which, on account of its pliability, has been found very convenient, and easy to be managed among the rigging of the vessel; but as the electricity finds a great obstruction in going through the several links, for which reason chains have been actually broken by the lightning, so their use has now been almost entirely laid aside; and, in their stead, copper-wires a little thicker than a goose-quill have been substituted, and found to answer very well. One of these wires should be elevated two or three feet above the highest mast in the vessel; this should be continued down the mast, as far as the deck, where, by bending, it should be adapted to the surface of such parts, over which it may most conveniently be placed, and, by continuing it down the side of the vessel, it should be always made to communicate with the water of the sea.

In regard to personal security, in case a thunder-storm were to happen while a person is in a house not furnished with a proper conductor, it is advisable not to stand near places where there is any metal, as chimnies, gilt frames, iron casements, or the like; but to go into the middle of a room, and endeavour to stand or sit upon the best non-conductor that can be found at hand, as an old chair, a stool, &c. If a storm was to happen whilst a person is in the open fields, and far from any building, the best thing he can do is to retire within a small distance of the highest tree or trees he can get at; he must by no means go quite near them, but should stop at about fifteen or twenty feet from their outermost branches; for if the lightning should fall thereabout, it will very probably strike the trees; and in case a tree was to be split, he is safe enough at that distance from it. We shall conclude this section with a short extract from the earl of Stanhope's learned work, entitled Principles of Electricity, containing the requisites necessary for the proper construction of conductors for lightning, in order to preserve buildings from its depredations; and which are quoted with approbation by Mr. Cavallo. These requisites are, "1. That the rods be made of such substances as are the best conductors of electricity. 2. That the rods be uninterrupted and perfectly continuous. 3. That they be of a sufficient thickness. 4. That they be perfectly connected with the common stock. 5. That the upper extremity of the rods be as acutely pointed as possible. 6. That it be very finely tapered. 7. That it be prominent. 8. That each rod be carried in the shortest convenient direction, from the point at its upper end to the common stock. 9. That there be neither large nor prominent bodies of metal upon the top of the building proposed to be secured, but such as are connected with the conductor by some proper metallic communication. 10. That there be a sufficient number of high and pointed rods; and, 11. That every part of the building be very substantially erected." He also advises that the upper 15 or 20 inches of the rod should be copper, as iron is subject to rust, and rust is a bad conductor.

THEORY OF ELECTRICITY.

The mind of man is not satisfied with a simple knowledge of the facts, which an attention to the phenomena of nature presents to his view. He wishes to account for them; to trace the causes from their effects; and although philosophers and sages have been repeatedly, and almost constantly, foiled in their endeavours to discover first causes, yet the same principle still excites the inquisitive investigator to build theory after theory, and to erect one hypothesis upon the ruins of another. We cannot, therefore, be surprised that the wonderful phenomena of electricity should have excited this active principle of human nature to account for them, upon the first observation of them. In fact, this was even attempted by Thales, who first observed the attractive power of amber. At this property he was so much surprised, that he reckoned the amber to be animated. With regard to the conjectures of Theophrastus on this subject, we are entirely in the dark; but, among the succeeding electricians, all the phenomena were derived from unctuous effluvia emitted by the excited electric. These were supposed to fasten upon all bodies in their way, and to carry back with them all that were not too heavy. For, at that time, effluvia of every kind were supposed to return to the bodies from which they were emitted; as nobody could otherwise account for the substance not being sensibly wasted by the constant emission. When these light bodies, on which the unctuous effluvia had fastened, were arrived at the excited electric, a fresh emission of the effluvia was supposed to carry them back again. But this effect of the effluvia was not thought of till electric repulsion, as well as attraction, had been fully observed. The discovery of a difference between conducting and non-conducting substances, threw considerable difficulties in the way of those who maintained the hypotheses of unctuous effluvia. When the Newtonian philosophy began to be pretty generally received, the terms attraction and repulsion were quickly introduced into electricity, as well as other branches of philosophy; and the electric effluvia, instead of being of an unctuous nature, were said to be of an attractive or repulsive one. At the same time, the apparent stop which is put to the progress of these effluvia by any electric substance, introduced a question not yet well decided, viz. Whether electric bodies are penetrable by the fluid or not? When M. Du Fay discovered the two opposite species of electricity, at that time distinguished

tinguished by the names of vitreous and resinous, and afterwards by those of plus and minus, or positive and negative, he formed the idea of two distinct electric fluids. Both of these were supposed to have a repulsive power with respect to themselves, but an attractive one with regard to one another. As long as electrical attraction and repulsion were the only phenomena to be accounted for, this theory served the purpose well enough. To account for attraction and repulsion by an attractive and repulsive power, was indeed no explication at all; but it afforded a change of terms, which is too frequently mistaken for an explanation both in electricity and other parts of philosophy. At last, however, M. Du Fay dropped his opinion concerning the existence of two electric fluids, and thought that all the phenomena might be accounted for from the action of a single one. The vitreous or positive electricity, which was supposed to be the stronger, he thought might attract the negative, or weaker electricity. It is indeed true, that in many experiments, the positive electricity doth manifest a superiority in strength over the negative, something like that superior degree of vigour which is observed in one of the poles of a loadstone over the other. According to M. Du Fay's own principles, however, had this been the case, a body positively electrified ought to have attracted one electrified negatively more weakly than one not electrified at all; which is contrary to experience. During all this time, it was imagined that the electric matter, whether it consisted of one or more fluids, was produced from the electric body by friction; but by a discovery of Dr. Watson's, it became universally believed that the glass globes and tubes served only to set the fluid in motion, but by no means to produce it. He was led to this discovery by observing, that, upon rubbing the glass tube, while he was standing upon cakes of wax or rosin (in order, as he expected, to prevent any discharge of the electric matter upon the floor), the power was, contrary to his expectation, so much lessened, that no snapping could be observed upon another person's touching any part of his body; but that, if a person not electrified held his hand near the tube while it was rubbed, the snapping was very sensible. The event was the same when the globe was whirled in similar circumstances. For, if the man who turned the wheel, and who, together with the machine, was suspended upon silk, touched the floor with one foot, the electric fire appeared upon the conductor; but if he kept himself free from any communication with the floor, little or no fire was produced. He observed, that only a spark or two would appear between the hand and the insulated machine, unless he at the same time formed a communication between the conductor and the floor; but that then there was a constant and copious flux of the electric matter observed between them. From these, and some other experiments of a similar kind, Dr. Watson discovered what he calls the complete circulation of the electric matter. When he found, that by cutting off the communication of the glass globe with the floor, all electric operations were stopped, he concluded that the electric fluid was conveyed from the floor to the rubber, and from thence to the globe. For the same reason, seeing the rubber, or the man who had a communication with it, gave no sparks but when the conductor was connected with the floor, he as naturally concluded that the globe was supplied from the conductor, as he had before concluded that it was supplied from the rubber. From all this he was at last led to form a new theory of electricity, namely, that, in electric operations, there was both an afflux of electric matter to the globe and the conductor, and likewise an efflux of the same electric matter from them. Some time after, however, the doctor retracted this opinion concerning the afflux and efflux, and supposed that all the electric phenomena might be accounted for by the excess or diminution of the quantity of electric matter contained in different bodies. This theory was afterwards adopted by Dr. Franklin, and continues to be generally received. One great difficulty with which the first electricians were embarrassed (and which is yet scarcely removed), was to ascertain the direction of the fluid. At first, all electric powers were supposed to reside in the excited globe or glass tube. The electric spark, therefore, was imagined to proceed from the electrified body towards any conductor that was presented to it. It was never imagined that there could be any difference in this respect, whether it was amber, glass, sealing-wax, or any thing else that was excited. This progress of the electric matter was thought to be quite evident to the senses; and, therefore, the ob-

servation of electric appearances at an insulated rubber occasioned the greatest astonishment. In this case the current could not be supposed to flow both from the rubber and the conductor, and yet the first appearances were the same. To provide a supply of the electric matter, therefore, philosophers were obliged to suppose, that, notwithstanding appearances were in both cases much the same, the electric fluid was really emitted in one case by the electrified body, and received by it in the other. But now being obliged to give up the evidence from sight for the manner of its progress, they were at a loss, whether, in the usual method of electrifying by excited glass, the fluid proceeded from the rubber to the conductor, or from the conductor to the rubber. It was, however, soon found that the electricity at the rubber was the reverse of that at the conductor, and in all respects the same with that which had before been produced by the friction of sealing-wax, sulphur, rosin, &c. Seeing, therefore, that both the electricities were produced at the same time, by one and the same electric, and by the same friction, all philosophers were naturally led to conclude, that both were modifications of one fluid; though in what manner that fluid was modified throughout the immense variety of electric phenomena, was a matter not easily to be determined. On this subject the Abbé Nollet adopted the doctrine of afflux and efflux. He supposed, that, in all electrical operations, the fluid is thrown into two opposite motions; that the afflux of this matter drives all light bodies before it by impulse upon the electrified body, and its efflux carries them back again. He was, however, very much embarrassed in accounting for facts where both these currents must be considered; as in the quick alternate attraction and repulsion of light bodies by an excited glass tube, or other excited electric. To obviate this difficulty, he supposes that every excited electric, and likewise every body to which electricity is communicated, has two orders of pores, one for the emission of the effluvia, and another for the reception of them. M. De Tour improved upon Nollet's hypothesis, and supposed that there was a difference between the affluent and effluent current, and that the particles of the fluid are thrown into vibrations of different qualities, which makes one of these currents more copious than the other, according as sulphur or glass is used. It is impossible, however, that suppositions so very arbitrary could be at all satisfactory, or received as proper solutions of electric phenomena. Various other theories were proposed and maintained by different philosophers, but the theory invented by Dr. Franklin, and which had been first suggested by Dr. Watson, is generally received, as it is more simple than any other which has been proposed, and better accounts for the most remarkable electrical phenomena. This theory may be resolved into the following axioms:

- 1st. The electric matter is one and the same in all bodies, and is not of two distinct kinds.
- 2d. All terrestrial bodies contain a quantity of this matter.
- 3d. The electric matter violently repels itself, but attracts all other matter.
- 4th. Glass and other substances, denominated electrics, contain a large portion of this matter, but are not to be penetrated by it.
- 5th. Conducting substances are permeable by it, and do not conduct it merely over their surface.
- 6th. A body may contain a superfluous quantity of the electrical fluid, when it is said, according to this theory, to be in a positive state, or electrified plus; and when it contains less than its proper share, it is said to be negative, or electrified minus.
- 7th. By exciting an electric, the equilibrium of the fluid is broken, and the one body becomes overloaded with electricity, while the other is deprived of its natural share.

Thus, according to the Franklinian theory, that electricity, which was before called vitreous, is now called positive electricity; and that which was termed the resinous, is now denominated negative electricity. This theory, however, is not without its defects, and many electrical appearances remain as yet unexplained. We shall here propose another theory more simple even than that of Dr. Franklin, though in some things agreeing with it. And we hope to shew the cause of several electrical phenomena hitherto reckoned among the arcana of electricity. The theory which we here speak of, may be expressed in the five following articles, which may be considered as axioms in electricity.

1. The phenomena of electricity depend on one extremely subtle fluid, called the electric fluid.

2. The electric fluid is attracted by all other bodies, in some inverse ratio of the distance, and there is a repulsion exerted between its own particles, varying also in some inverse ratio of their distance.

3. All bodies while undisturbed possess a certain quantity of the fluid, called their natural quantity, which is in proportion to their attraction for the fluid.

4. Electrics have a stronger attraction for the fluid than non-electrics; and each particle of an electric is capable of receiving a small additional quantity of the fluid without communicating it to the next particle.

5. Bodies or parts of bodies having a greater proportion of the fluid than the contiguous bodies, the excess being such that they are emitting the fluid, or would be emitting it if an uninsulated conductor were presented, are said to be electrified positively; and if they have a less proportion, so that they are receiving the fluid, or would be receiving it, were a conductor presented, they are said to be electrified negatively.

Hypothesis is here excluded as far as the subject will admit. That there is according to the first article a subtle fluid concerned is exceedingly evident to the senses, that there is only one fluid can hardly be called an hypothesis since we see always the same effect produced by it under the same circumstances. The second article is founded on the general principles of attraction, which are well established by physical writers; and since the electric fluid is a material substance, it must be subject to the general laws: and the force of attraction has always been observed to be less at a greater distance. And that the fluid is elastic, or that its particles repel one another, is evident from its rapid motions and diffusion, and that the repulsion is greatest when the particles are nearest together, appears from the increased intensity of its action when compressed. The third article is only a corollary from the two foregoing, for since this fluid is subtle and elastic, it will be diffused; and bodies in their natural state and undisturbed, will each detain a quantity in proportion to its attraction for the fluid. Electrics have been found to contain a greater quantity of the fluid than non-electrics, and therefore, according to the third article, they must have a greater attraction for it; hence the fourth article is true; or, its truth appears from this, that electrics retain the fluid they receive more powerfully than non-electrics do; and that different bodies have different attractions for the same body is well known to chemists. That the electric fluid is attracted and held by the particles of glass may be thus shewn by experiment. Take a plate of thin glass, apply a loose coating to each side, and charge it in the common way; remove the coatings, and apply the knobs of the discharger to the opposite sides, the discharge will be partial; apply them to other parts, and these will be likewise partially discharged. This shews that the fluid near the parts where the conductor was applied, finding, as above stated, little resistance, was carried through the conductor to restore the equilibrium, but that the more distant fluid was retained there by some force, which we can attribute to no other cause than that of the attraction of the glass, for had a conductor covered the whole of the charged surface, it would have been conveyed away at once. The fifth article states, by way of definition, what is to be understood according to this theory by positive and negative electricity; and this, we apprehend, conveys a more accurate and just idea of these terms, as applied to this science, than the explanations hitherto given; for the phenomena of electricity must depend more on the state of bodies in respect of those contiguous to them, than in respect of their own natural quantity of fluid. It is in this article chiefly that our theory differs from Dr. Franklin's above-mentioned. That this theory will solve every phenomenon which can be accounted for on Dr. Franklin's theory is very evident, and the following propositions shew its use in solving those which that theory cannot account for. The positions here laid down are exceedingly consonant to nature, and are contradicted by no phenomena that we are acquainted with, and are therefore easily admitted; indeed the greater part of them are constantly evinced by electrical experiments. We shall here notice, in the way of propositions, the principal phenomena not well accounted for by electricians, and apply our theory to the explanation of them.

PROP. I. Electrics do not admit the passage of the electric fluid through them, or they admit it very slowly, and with difficulty,

i. e. they are non-conductors; non-electrics give very little resistance to the passage of the fluid, i. e. they are conductors. This appears from innumerable experiments. The cause of these phenomena has not as yet been fully ascertained; however it has been said to depend on the attraction of the electric for the fluid. This, we apprehend, is deficient as it only assigns one part of the cause; the other part is the elasticity of the fluid, and by considering these jointly we may easily shew the reason why some bodies are conductors and others non-conductors. Thus when a non-electric, communicating with the earth, is presented to a body emitting the fluid, (ax. 5,) very little resistance will be given to its passage along the non-electric, that is, it will not detain the fluid, because its attraction to it is weak, (ax. 4,) therefore it will be propelled through it by its elastic force, (ax. 1 and 2,) hence non-electrics are conductors, and the reason is, their attraction for the fluid being weak they are not capable of detaining an additional dose, without communication to the next particles. Again, let a non-conductor be presented, it likewise receives a portion of the fluid; but since the particles presented by their strong attraction for the fluid, will retain more than their natural quantity without communication to the next particles, suppose them to have received as much as they can thus contain, and their increased atmospheres of fluid will by its repulsive force cause the fluid of the next particles to recede somewhat to the opposite side, if an additional quantity of fluid be thrown on the first particles, the next will begin to receive a portion of it, and on a still farther increase the next to these in order will begin to receive, and so on in succession, till the intensity of the fluid on the first particles; and consequently its elasticity at length becomes so increased that it effectually prevents or opposes the further entrance of the fluid; if the intensity be increased on the body emitting the fluid, it will also be soon increased proportionally on the presented electric, whence its progress is prevented, and this fully explains the cause of its being a non-conductor. It is evident from this explanation, that the more perfect the electric is, the less will be the distance that the fluid will proceed before it is arrested; which will also happen from the less intensity of the insulated conductor. It is evident also from this, and ax. 4, that conductors and non-conductors, as well as non-electrics and electrics, will be more or less perfect according to their attraction for the fluid. For an account of the order, &c. of the conductors and non-conductors see above.

SCHOLIUM. It is very probable that conductors and non-conductors of heat depend on similar principles.

PROP. II. The electric fluid is received principally, and in greatest abundance, from the earth. For when the electric and rubber are insulated it will exhibit small signs of the electrical appearances; and when the communication is made by a conductor having small interruptions, by means of electrics, the fluid will be rendered visible in its passage between the earth and the rubber. The cause of this may be thus shewn. Since the earth is a large body containing in itself a very great number of substances; which have an attraction for the fluid, (ax. 2,) it will constitute a great and general reservoir for the fluid, (ax. 3,) and since the earth contains also a great many conductors; when the rubber emits the fluid the equilibrium will be restored by means of these conductors, (Prop. I.) to the rubber. When the rubber receives the fluid it will by the same means be conveyed to the general reservoir; when the excited bodies are insulated this supply is cut off; (Prop. I.)

PROP. III. A greater or less quantity of the electric fluid may be contained in electrics or insulated conductors than naturally belongs to them. Bodies in returning to their natural state after excitation are observed in some cases to be receiving the fluid, and in other cases to be emitting it. That this should take place appears from ax. 2 and 4, and Prop. I.

PROP. IV. When bodies or parts of bodies are contiguous, and some of them have a surcharge, or deficiency of the electric fluid; or if some of them have a surcharge, and others a deficiency; or if one of them be in its natural state: and if there be a considerable difference in their proportionate quantity of fluid: then of those contiguous bodies that which has the greater quantity of the fluid in proportion to its natural quantity will communicate a part of it to the other. This is exceedingly manifest in many experiments; thus, if the air have more than its natural quantity, and be contiguous to a body having less than its natural quantity, or more than

than its natural quantity, but in a less proportion than the contiguous air, and if the difference of the proportionate quantities be sufficiently great, the body will receive part of the fluid from the air. The reverse of this is also true. The phenomenon is produced partly by the attraction of the contiguous body, and partly by the repulsive force of the fluid, (ax. 2,) by which it is propelled towards the part where it is least resisted.

Cor. From this, according to ax. 5, it follows that bodies emitting the fluid are electrified positively, and bodies receiving it are electrified negatively, and vice versa.

PROP. V. When a body is electrified either positively or negatively, the bodies which are near it will be electrified with the contrary electricity, if the bodies be not insulated. This is a phenomenon exhibited in all electrical experiments. The cause has hitherto been reckoned among the desiderata of electricity. No phenomenon in electricity seems to be more difficult to solve, than the question, Why positive electricity induces the negative kind on any body within its sphere of action, and why the negative kind produces the positive in similar circumstances? Mr. Tytler pronounces it totally insolvable, unless we give up the idea of accumulation and deficiency of the electric fluid in different bodies. On Dr. Franklin's principles no solution hath been attempted. Mr. Cavallo places this among the properties of electricity, for which he doth not pretend to account, but gives us the causes of other phenomena. On the theory here proposed this difficulty entirely vanishes, for since when one body is emitting the fluid another which is near that body must be receiving it, and vice versa. Therefore, (ax. 5, and Prop. IV.) when a body is electrified the adjacent bodies will be electrified with the contrary power, till its quantity of fluid bears a certain proportion to that of the body, by which it is electrified. Hence, if the body placed near that which is electrified be a conductor, it will continue in the opposite state.

PROP. VI. Two bodies, at liberty to move in the air, will, when electrified either positively or negatively, appear to repel each other; but when one is positive, and the other negative, they appear to attract each other. This is well known to electricians, but the cause of the repulsion of two bodies negatively electrified has not been well explained. We hope the following will be satisfactory: Let two bodies, as two cork balls, be suspended in the air, and 1, let them be electrified positively: then since they are emitting the fluid there will be a re-action of the air against the fluid which is leaving the bodies, and the air will be driven outward and react against the balls. It is evident that this re-action will be greatest between the balls, for since it proceeds from the two adjacent surfaces the air will be impelled or driven outward from both surfaces, and consequently will re-act with a greater force, and thus the balls will be repelled. 2. Let the two balls be electrified negatively, then the motion of the fluid towards the balls by its action on the air will cause a pressure at the surfaces of the balls on all sides towards the centre, that is, the fluid moving towards the balls will cause some degree of motion in the air towards them; and since this motion is towards both the adjacent surfaces, the force will be increased on each, while the opposite sides remain unaltered, and thus they will be repelled or driven asunder. And here it may be observed, that the repulsion in positive electricity is caused by the reaction of the air, which is driven outward, or from the balls: but in negative electricity it is occasioned by the action of the air, which is driven inward, or towards the balls. Also other things being the same, the effect will be greater in positive electricity than in the negative, for that is caused by an excess of fluid, and this by a deficiency of the fluid. 3. Let one of the bodies be electrified positively, and the other negatively; then, at the adjacent surfaces, the fluid which is given out from one supplies the deficiency of the other, and thus no motion of the air between them is produced either inward or outward; but the forces remain on the two opposite sides, and therefore the balls will be driven together, that is, they will apparently attract each other, with considerable force.

PROP. VII. If an insulated conductor free from points be put within a certain distance of an electrified body, the end presented will be electrified with the contrary power, and the more distant end with the same power. This appearance is observed by all electricians, but no good reason has been assigned for it. We offer the following on the principles above laid down. Let the body,

to which the insulated conductor is presented, be electrified positively, then the contiguous air is receiving the fluid, and since the air is an electric the atmospheres of fluid on the particles of the air will extend on the more distant sides of the particles, as explained in Propositions 1 and 6, and in like manner will the end of the presented conductor be influenced, but because of its weak attraction for the fluid, its particles cannot retain the atmosphere on their more distant sides, and thus it is conducted to the further end where it affects the particles of the contiguous air by its endeavour to escape; and thus the nearer end is negative and the other positive. The effect is contrary if the body, to which it is presented, be negative. This also accounts for the effects of the electrophorus.

PROP. VIII. If one side of the Leyden phial, or of a thin plate of coated glass, be presented to a conductor electrified positively, and if the other side communicate by conductors with the earth, the glass will become strongly charged, and if the two coatings be then connected by a conductor an explosion will take place. This curious phenomenon may be thus explained. Because the coating is a conductor, as it receives the fluid, it disperses it over the coated surface, and the particles of glass at this coating obtain an additional dose of the fluid by which the atmospheres of fluid on the next particles stand more to the other side, and thus, if the fluid on the positive conductor be sufficiently intense, and the glass very thin, the particles at the other coating will be affected, and since this coating is a conductor and communicates with the earth, the atmosphere propelled to this side will be carried off; and thus the pressure or resistance is partly removed from the side which is receiving the fluid; so that it will receive still more, and also more will be carried away from the side connected with the earth, and the operation being continued, the maximum of difference will be at length attained, and the glass is charged. Now if the two coatings be connected by a conducting substance the fluid will by means of its elasticity pass from the positive side to the negative, since there is nothing on either side, or in the discharger, to prevent the equilibrium from taking place. It is evident from the above principles and propositions that the maximum of difference, or greatest charge, will depend on the goodness of the electric plate, on its thickness, and on the intensity of the electrified body by which it is charged; thus, 1. If a worse electric plate be used, other things being the same, the charge will be less, for the particles which receive the fluid will not retain so great a quantity before they communicate a portion to the next in order. 2. If the thickness of the electric plate be increased other things remaining the same the charge will be less, for the fluid on the side which receives it will not so much displace the atmospheres of fluid on the other side according to what was explained in Prop. I. 3. If the intensity of the electrified conductor be less, other things being the same, the charge will be less, for the intensity of the side of the plate which receives the fluid will sooner equal it, and therefore the fluid on the other side will be less affected, and hence the charge will be less. These consequences of the above principles are found to agree with phenomena. And here we may observe that an insulated plate is in the case of a very thick electric, and therefore will not receive a charge.

PROP. IX. If the conductor, to which the coated plate as in the last proposition is presented, be negative, the plate will receive a charge. For a portion of fluid being taken away from the side presented, the pressure is taken from the next particles, and the fluid will lie towards that deficient side: now since the atmospheres of the particles at the coating connected with the earth are removed from that coating to the other side of the particles, these particles will receive an additional quantity from the earth, and the operation being continued, a maximum of difference will take place, and the glass will be charged. Note, a little reflection will shew that the whole quantity of fluid on the glass is less than in the case last mentioned, since this is by an abstraction, and that by a redundancy of fluid.

PROP. X. While an electric plate is charging positively, both sides will be in a positive state; but after it is charged, the side which is presented is positive, and the other negative. For the side which is presented receives the fluid at one part, and this fluid being dispersed over the coated surface, it will from its redundancy of fluid begin and continue to discharge it to the surrounding air, and is therefore positive. Also the other side by the pressure of the fluid on it, as above explained, parts with some of its natural quantity,

quantity, and thus it is positive; but after the charge the first side continuing to give out the fluid, because of its redundancy, is still positive, but as this is given out, the pressure is taken from the other side, and hence its deficiency begins to be supplied, or it begins to receive the fluid, or is negative.

PROP. XI. While an electric plate is charging from a negative conductor, both sides are negative, but after the charge the side which was presented is negative and the other positive. For the fluid is taken from one part of the side presented, and hence there is a deficiency as far as the coating extends; and hence it begins to receive, or is negative, and the pressure being taken from the opposite side it will also receive or be negative; and after the charge the side which had been presented will continue to receive, or will still be negative, and hence the pressure will return to the other side which will begin to give out what it had received, that is, it will be positive, however in a weak charge the positive electricity is scarcely perceptible, because in this case it had received very little during the charge.

PROP. XII. When a pointed body is strongly electrified positively the electric fluid is rendered visible in a diverging stream from the electrified point, when negatively electrified the appearance is that of a small star. The electric fluid, when sufficiently dense and in rapid motion through the air, exhibits the electric light, and the air can oppose little resistance to a point; hence the fluid will move with rapidity from the positively electrified point, and from its elasticity will tend to diverge, it is immediately followed by other fluid from the point, which forces it in ramifications through the air and renders the streams visible to some distance. The case is different at the negative point, for since the fluid is entering from the air the fluid is not impelled by that which follows, and hence will become visible only near the point, and at an equal distance from all parts, which will give the appearance of the small star. We have thought proper to explain the above phenomena to elucidate, and shew the utility of our theory, but our limits will not permit us to proceed thus to expatiate upon the very numerous electrical appearances which have been observed, we shall therefore notice the principal of them, and leave the explanation for the most part to the ingenuity of the reader.

PRACTICE OF ELECTRICITY.

OF THE ELECTRICAL APPARATUS IN GENERAL.

The practical part of electricity naturally divides itself into two branches, viz. the apparatus employed, and the experiments made with it; but the use and application of the former being best illustrated by the latter, we thought it improper to separate them. Mr. Cavallo subdivides the former into three classes, viz. 1. The instruments necessary to produce electricity: 2. Those proper to accumulate, retain, and employ it: and 3. Those necessary to measure its quantity, and ascertain its quality. The instruments principally used to produce electricity are called by way of emphasis, Electrical Machines. They are made in so many different forms, that it would be tedious and difficult to give only a very short description of them all. We shall therefore first lay down the most necessary rules for constructing electrical machines in general; and then give a particular description of those which are most generally useful, and contain the latest improvements. The principal parts of the electrical machine are the electric, the moving engine, the rubber, and the prime conductor, *i. e.* an insulated conductor, which immediately receives the electricity from the excited electric. Electrics were formerly used of different substances, as glass, rosin, sulphur, sealing-wax, &c. Their forms were also various, as globes, cylinders, spheroids, &c. The reason of this variety was, 1st, that it was not then ascertained what substance acted most powerfully; and 2dly to produce a positive or negative electricity at pleasure. At present, globes, cylinders, and plates of smooth glass, are chiefly used; for when the machine has an insulated rubber, the operator may produce positive or negative electricity at his pleasure, without changing the electric; which clearly proves the falsity of those systems of electricity, which are founded upon the supposition of a specific difference between vitreous and resinous electricity, as arising from the nature of the different substances producing them. The best cement for electrical purposes is made with two parts of rosin, two of bees-wax, and one of the powder of red ochre. These ingre-

dients are melted, and mixed together in any vessel over the fire; and afterwards kept for use. This kind of cement sticks very fast, and is much preferable to rosin only, as it is not so brittle, and at the same time insulates equally well. The cylinders are made with two necks: they are used to the greatest advantage without any axis; and their common size is from four inches diameter and eight inches long, to twelve inches diameter and two feet long. Very large cylinders should be strengthened by a glass axis, viz. a solid stick of glass from the one cap to the other. The glass generally used is the best flint; though it is not absolutely determined which kind of metal is the best for electrical machines. The thickness of the glass seems immaterial, but perhaps the thinnest is preferable. It has often happened that glass globes and cylinders, in whirling, have burst in pieces with great violence, and with no small danger to the by-standers. Those accidents, are supposed to happen when the globes or cylinders, after being blown, are suddenly cooled. The workmen should therefore be enjoined to let them pass gradually from the heat of the glass-house, to the temperature of the atmosphere. Electricians are not agreed, whether a lining of some electric substance, as rosin, turpentine, &c. on the inside surface of the glass, has any effect to increase its electrical power; but it seems pretty well determined, that if it do not increase the power of a glass globe, or cylinder, at least it considerably improves a bad one. The most improved composition for this purpose is made with four parts of Venice turpentine, one part of rosin, and one part of bees wax. This composition must be boiled for about two hours over a gentle fire, and stirred very often: afterwards it is left to cool, and reserved for use. When a globe or cylinder is to be lined with this mixture, a sufficient quantity of it is to be broken into small pieces, and introduced into glass; then, by holding the glass near the fire, the mixture is melted, and equally spread over all its internal surface to about the thickness of a sixpence. In this operation, care must be taken that the glass be made hot gradually, and be continually turned so that it may be heated equally in all parts, otherwise it is apt to break in the operation. As to the engine which is to give motion to the electric, multiplying wheels have been generally used, which, properly adapted, might give the electric a quick motion, while they are conveniently turned by a winch. However some turn the machine simply with a winch, without any accelerated motion: and this method, on account of its simplicity and easy construction, may in most cases be preferred.

The RUBBER, as it is now made, (says Mr. Cavallo,) is nothing more than a silk cushion stuffed with hair; and over this is put a piece of leather, on which some amalgam has been rubbed, so as to stick as fast as possible to the leather. Sometime ago it was generally used, and it is now customary also, to make the rubber of red Basil skin stuffed with hair; but the silk one, as above described (which is an improvement of Dr. Nouth's) is much preferable. If this silk cushion, on account of adapting it to the surface of the glass, is to be fixed upon a metal plate, then care should be taken to make the plate free from sharp points, edges, or corners, and it should be as much as possible concealed, or covered with silk. In short to construct the rubber properly, it must be made in such a manner, that the side of it, which the surface of the glass enters in whirling, may be as perfect a conductor as it can be made, in order to supply electricity as quick as possible; and the opposite part should be as much a non-conductor as possible, that none of the fluid may return back to the rubber; which has been found to be the case, when the rubber is not made in a proper manner; for which reason a piece of silk is also added to the extremity of the leather. Mr. Nairne's rubber consists of silk only put over the leather cushion, and very little amalgam is used with it. The following is still more simple; let a piece of wood be fitted to the surface intended to be subjected to friction, and covered first with two or three thicknesses of elastic cloth, then with smooth leather, and lastly with a flap of silk, pasted upon the edge at which the glass in its rotation arrives, and let it pass loose over the face of the cushion, and thence upon the surface of the glass, as far as the commencement of the prime conductor. To the line of contact of the rubber and electric, a little amalgam ought to be applied, since it renders the excitation much more active. Any metal dissolved in quicksilver, will do for an amalgam; but the one that has been generally used is made with two parts of quicksilver, and one of tin-foil, with a small quantity of powdered chalk

chalk mixed together in a mass like paste. The best kind of amalgam is that of Dr. Higgins, composed of zinc and quicksilver; if a little of the latter be added to melted zinc, it renders it easily pulverable, and more quicksilver must be added to the powder, if we want to make a very soft amalgam. It is apt to crystallize by keeping, which seems in some measure to be prevented by triturating it with a small proportion of grease: and it is always of advantage to triturate it before using. The proportion prescribed by Dr. Higgins, is one part of zinc to four or five parts of mercury. Aurum mosaicum, or mosaic gold, will answer nearly as well, though it is not quite so cleanly. The rubber should be supported by a spring; by which it will easily suit any inequalities that may be on the surface of the glass; and by a screw, it may be made to press more or less as occasion requires. It should also be insulated in the most perfect manner; as, when insulation is not required, it may be easily taken off by a chain or wire hung upon it, and thus communicate with the earth or any electrified body; but where there is no contrivance for insulating the rubber, it is impossible to perform many of the most curious electric experiments.

The PRIME CONDUCTOR, is an insulated conducting substance, furnished with one or more points at one end, to collect the electricity immediately from the electric. When it is wanted of a moderate size, it is usual to make it of hollow brass; but when it is intended to be very large, then, on account of the price of the materials, it is made of pasteboard covered with tin-foil or gilt paper. It is generally cylindrical, and should always be made perfectly free from points or sharp edges: and if holes are to be made in it, which on many accounts are very convenient, they should be well rounded, and made perfectly smooth. That end of it which is at the greatest distance from the electric ought to be made larger than the rest, as the strongest exertion of the electric fluid to escape from the conductor is always at that end. The larger the prime conductor is, the longer and denser a spark can be drawn from it, the quantity of electricity discharged in a spark, being nearly proportional to the size of the conductor. On this account, the prime conductor is now made much larger than formerly. Its size, however, may be so large, that the dissipation of the electricity from its surface, may be greater than the electric can supply; in which case, the increase of size would only render it an unwieldy and unnecessary incumbrance. Besides the above mentioned parts, it is necessary to have a strong frame to support the electric, the rubber, and the wheel. The prime conductor should be supported by pillars of glass or baked wood, and not by silk strings, which admit of continual motion. In short, the machine, the prime conductor, and any other apparatus actually used, should be made to stand as steady as possible, otherwise many inconveniences will arise. Every electrician should be provided with glass tubes of different sizes, a pretty large stick of sealing-wax, or a glass tube covered with sealing-wax, for the negative electricity. He should, at least, not be without a glass tube about three feet long, and one and a half inch in diameter. This tube should be closed at one end, and at the other end should have fixed a brass cap with a stop-cock; which is useful in case it should be required to condense or rarefy the air within the tube. The best rubber for a tube of smooth glass is the rough side of black oiled silk, especially when it has some amalgam rubbed upon it; but the best rubber for a rough glass tube, a stick of baked wood, sealing-wax, or sulphur, is soft new flannel. The most proper instruments for what is called the accumulation of electricity are coated electrics; among which, glass coated with conductors obtains the principal place: on account of its strength, it may be formed into any shape, and it will receive a very great charge. The form of the glass is immaterial with respect to the charge it will contain; its thickness only is to be considered: for the thinner it is, the more easily will it receive the utmost charge it can bear; but it is at the same time more subject to be broken. For this reason, a thin coated jar or plate may be used very well by itself, and it is very convenient for many experiments; but when large batteries are to be constructed, it is necessary to use glass a little thicker, and care should be taken to have them perfectly well annealed. The most useful jars are thin cylindrical glass vessels, about four inches in diameter, and fourteen in height, coated within and without with tin-foil, which is stuck on with gum-water, paste, or wax, excepting two inches of the rim or edge, which is left bare, to prevent the communication between the coatings. A-

bout four inches from the bottom, within, is a large cork, that receives a thick wire, ending in several ramifications, which touch the inside coating; the upper end of the wire terminating with a knob, considerably above the mouth of the jar, Plate LXIII, fig. 3. When it is required to be charged, it may be held in the hand, or placed on an uninsulated table, and the knob of the wire applied to the conductor; the inside coated surface becomes possessed of the electricity of the conductor, and the external surface acquires the contrary electricity, by means of its uninsulated coating. When a jar of this kind is highly charged, it will discharge spontaneously over the uncoated surface, and seldom through the glass, whereas, when the uncoated surface is large, it is more apt to break by that means, and become useless. Yet, there is no certainty that a jar, which has discharged itself over its surface, will not at another time break by a discharge through the glass, as the contrary often happens. If paper covered with tin-foil be used for the coating, with the paper next the glass, the jar will be less liable to break. A jar of considerable thickness, with a neck like a bottle, in which is cemented a thick tube to receive the wire, will sustain a very high charge, and produce much greater effects than one of the last description. The charging wire being inserted loosely into the tube, will fall out on inverting the jar, and the charge will remain for several weeks without much loss. A jar thus charged, may be put into the pocket, and applied to many purposes that the common jar cannot be used for. If the inside of the jar be considerably damped, by blowing into it, through a tube reaching to the bottom, it will take a charge nearly one-third greater than in the ordinary state.

If A BATTERY be required of no very great power, as containing about eight or nine square feet of coated glass, common pint or half-pint phials may be used. They may be easily coated with tin-foil, sheet lead, or gilt paper, on the outside, and brass filings on the inside: they occupy a small space, and, on account of their thinness, hold a very good charge. But when a large battery is required, these phials cannot be used, for they break very easily; and for that purpose, cylindrical glass jars of about 15 inches high, and four or five inches in diameter, are the most convenient. See Plate LXIII, fig. 4. In coating glass plates or jars, which have a sufficiently large opening, the best method is to coat them with tin-foil on both sides, which may be fixed upon the glass with varnish, gum water, bees wax, book-binder's paste, &c. but if the jars have not an aperture large enough to admit the tin-foil, and an instrument to adapt it to the surface of the glass, then brass filings may be advantageously used. These may be stuck on with gum water, bees wax, &c. but not with varnish, for this is apt to be set on fire by the discharge. Care must be taken that the coatings do not come very near the mouth of the jar, for that will cause the jar to discharge itself. If the coating be about two inches below the top, it will in general do very well: but there are some kinds of glass, especially tinged glass, that when coated and charged, have the property of discharging themselves more easily than others, even when the coating is five or six inches below the edge. When a jar discharges itself, the electric fluid runs from the inside to the outside coating over the surface of the glass where it leaves an indelible mark all along its path, generally of a zig-zag form. There is another sort of glass, like that of which Florence flasks are made, which, on account of some unvitrified particles in its substance, is not capable of holding the least charge. On these accounts, therefore, when a great number of jars are to be chosen for a large battery, it is advisable to try some of them first, so that their quality and power may be ascertained. Many attempts have been made by electricians to find some other electric, which might answer better than glass for this purpose, at least in point of cheapness; but, except Father Beccaria's method, which may be used very well, no remarkable discovery has been made relating to this point. He took equal quantities of very pure colophonium, and powder of marble, sifted exceedingly fine, and kept them in a hot place a considerable time, where they became perfectly free from moisture: he then mixed them, and melted the composition in a proper vessel over the fire; and, when melted, poured it upon a table, upon which he had previously stuck a piece of tin-foil, reaching within two or three inches of the edge of the table. He then, with a hot iron spread the mixture all over the table as equally as possible, to the thickness of one-tenth of an inch: he afterwards coated it with another piece of tin-foil reaching within about two inches of the edge of the mixture: in short, he coated a plate of this mixture like

like a plate of glass. This coated plate seems to have had a greater power than a glass plate of the same dimensions, even when the weather was not very dry: and if it is not subject to break very easily by a spontaneous discharge, it may be very conveniently used; for it doth not very readily attract moisture, and consequently may hold a charge of electricity better and longer, than glass: besides, if broken, it may be repaired by a hot iron; which is not the case with glass. For discharging a jar, battery, or any coated electric without receiving the shock, two instruments have been contrived, one called the common Discharging Rod, (Plate LXIII. fig. 5,) which is nothing more than a semi-circular brass wire, furnished with two brass balls, one at the end of each wire. The other, which is of very extensive use in electrical experiments, is called the Jointed Discharging Rod, (fig. 6.) It is furnished with a glass handle: the legs are moveable, and may be set to any distance that may be convenient. When the electrician is to use this instrument, he holds it by the handle; and touching one of the coated sides of the charged electric with one knob, and approaching the other knob to the other coated side, or some conducting substance communicating with it, he completes the communication between the two sides, and thus discharges the electric. Henley's universal discharger consists of two wires, supported by glass feet, with a small table between them to support any thing that may be the object of the experiment. It is found to be a very useful instrument for a variety of purposes, and is composed of the following parts: A (fig. 7.) is a flat board, about fifteen inches long, four broad, and one thick. BB are two glass pillars, cemented in two holes upon the board A, and furnished at top with brass caps, each of which has a turning joint, and supports a spring tube, through which the wires DD slide. Each of the caps is composed of three pieces of brass, connected so that the wires DD, besides their sliding through the sockets, have a horizontal and vertical motion. Each of the wires DD is furnished with an open ring at one end, and at the other it has a brass ball, which, by a short spring socket, is slipped upon the pointed extremity, and may be removed. E is a circular piece of wood, having on its surface a slip of ivory inlaid, and furnished with a foot, which is fastened in the middle of the bottom A. The instruments for measuring the quantity, and ascertaining the quality, of electricity, are called Electrometers. The simplest of all is a pair of little balls of cork, or rather of the pith of the elder, which is still lighter, and suspended by silk and sometimes by linen threads. When brought into contact with an electrified body, the balls will immediately diverge, and according to the degree of divergence, a judgement is formed of the degree in which the body in question is electrified. A similar effect will be produced by a light and downy feather. The pith-balls have received the name of Canton's electrometer, from the ingenious electrician who first employed them for this purpose, and they are found useful in many experiments. See fig. 28. For a more accurate admeasurement, Henley's quadrant electrometer is in most general use. It consists of a perpendicular stem formed at top like a ball, and furnished at its lower end with a brass ferule and pin, by which it may be fixed in a hole made in the conductor, or at the top of a Leyden bottle. To the upper part of the stem, a graduated ivory semicircle is fixed, about the middle of which is a brass arm or cock, to support the axis of the index. The index is a very slender stick, which reaches from the centre of the graduated arch to the brass ferule; and to its lower extremity is fastened a small pith-ball nicely turned in a lathe. When this electrometer is in a perpendicular position, and not electrified, the index hangs parallel to the pillar; but when it is electrified, the index recedes more or less, according to the quantity of electricity. See fig. 8. Lane's discharging electrometer is employed chiefly by the practitioners of medical electricity. It is represented by FDE, in fig. 9, and is fixed to the wire that proceeds from the inside of the jar Z. The ball B touches the prime conductor A, which is supposed to stand before an electrical machine. The electrometer consists in a glass rod FD, furnished with brass caps F, D: from the latter proceeds a strong brass wire, to which is attached an horizontal spring-socket: through this, the wire CE, having the ball C at one end, and the open ring E at the other, may be slid backwards and forwards, so as to place the ball C at any required distance from the ball B. Suppose the distance between B and C to be one-eighth of an inch or less, and that by means of a chain X, a communication be formed from E

to the outside coating of the jar. When the jar is charged so high that the fluid can leap from B to C, the discharge will take place, and the stroke pass through X from the inside to the outside of the jar. When the shocks are to be given through any part of the body, as the arm, then, instead of the chain X, wires EL and IL are to be fastened, one to the ring E, and the other to a hook at I of the stand HI which communicates with the outside of the jar. The other extremities of the wire must be fastened to the directors K, L, which consist of brass wires and balls as L fastened into glass handles as shewn at K. The mode of operation is easily understood from a view of the figure, for when the chain X is away, the electric fluid must, in passing from the inside of the jar to the outside, go through the wire EL; the brass of the director; the part of the arm between the balls of the directors; and through the wire LI. By moving C nearer to, or farther from B, the strength of the shocks will be regulated to any degree. If a plate of glass be laid upon an uninsulated plate of metal, the upper surface may be rendered electric by friction, or by applying an electrified body successively to its parts. Part of this electricity may be taken off by touching the upper surface with an uninsulated metallic plate of the same dimensions as that upon which the glass is placed. After this, if a plate of metal, to which a glass handle is affixed, be laid upon the glass, this small quantity of electricity will influence the metal, and, without actually communicating the electric matter, will cause it to exhibit a similar state. If this be taken off, by drawing the spark, and the metal then removed, by means of the glass handle, it will be found possessed of the contrary state of electricity, and another spark may be obtained. The metallic plate may be then again applied to the surface of the glass, and the process again repeated, and so on for a great number of times, without any sensible difference in the event. For the electricity at the surface of the glass being almost in the natural state, as to condensation, does not disappear for a very long time, and on the very near approach of the metal it causes the fluid in the metal to recede to one side, and thus makes it capable of giving or receiving the spark according as the glass is positive or negative; and hence when it is removed, it is electrified without having affected the excited electric. It consists of two plates, (fig. 10,) made of a circular form, from eight to eighteen inches in diameter, or upwards. The upper plate is generally made of brass; but a tin plate, with a wire turned in upon its edge, will answer exceedingly well. At the centre of this plate a glass handle nine or ten inches long is fixed. A thin board, covered with tin-foil, and suspended by silken strings, will answer well, when the electrophorus is wanted of a large diameter. The under plate may be made of glass, sealing-wax, or the following composition, viz. four parts rosin, three parts pitch, three parts shell-lac, two parts Venice turpentine, melted together over a gentle fire. It may be poured and spread upon a thin linen cloth, to about one-fourth of an inch thick. The linen cloth must be stretched upon a hoop, and made as tight as possible. If the surface is a little rough, it will be no worse. The manner of using this machine is as follows: Rub the coated side of the under plate with fine new flannel, or a hare's or cat's skin; and when it is excited as much as possible, set it on a table, and place the upper plate upon it, and put your finger on the upper plate; then remove your finger, and take hold of the top of the glass handle, and apply it to the knob of a coated jar. Repeat this operation for 30 or 40 times, and the jar will become charged. Cavallo mentions one of the above kind made by him, with which he charged a coated phial several times, by once exciting, so strong as to pierce a hole through a card at every discharge. In fig. 1, Plate LXIII. A represents the glass cylinder of a machine, turned by P, the handle. Its surface rubs against C, the cushion, from which proceeds D, the silk flap, and the electricity is conveyed to E, the prime conductor. The supports of the cylinder, the cushion, and (indispensably) of the prime conductor, are made of glass or baked wood, in order that the electricity may not be conveyed to the earth, unless when the operator chooses to make the communication by some conducting body. A prime conductor is sometimes applied to the rubber. Fig. 2 shews the plate machine, with Nicholson's cylinder improvements for changing the two states at pleasure; as adapted by Dr. Van Marum, of Haerlem. The glass plate GG, is fastened to the axis BB, by means of a screw on the axis passing through a hole in the centre of the plate, and secured by a nut C, on the opposite

opposite side. The axis is supported by a single pillar A, which for this purpose is provided with a bearing piece K, on which are two brass collar pieces, that carry the axis; and on the end of the axis, opposite the glass, is a counterpoise O, of lead, to prevent too great a friction in the collar nearest the handle. The arc of the conductor EE, which carries the two small receiving conductors FF, is fixed to an axis turning in the ball H. On the other side of the plate is the other arc I, of brass wire, fixed in the bearing piece K, but so as to admit of being turned round like the arc EE. P is a copper tube, moving like a radius on the stem of the ball S, which, being screwed into the conductor H, serves to confine the arm P, in any position that may be required. The dissipation of electricity along the glass supports is prevented by a kind of cap T, of mahogany, which affords an electrical well or cavity underneath, and likewise effectually covers the metallic cap into which the glass is cemented. The lower extremity of the pillar is guarded in the same manner by a hollow piece or ring of mahogany V. The three glass pillars are set in sliding pieces WWW, adjustable by screws; at each extremity of the horizontal diameter of the plate are two rubbers X, one on each side, pressed regularly and uniformly against the plate by means of a spring Y, the force of pressure of which is regulated by means of a screw. To these rubbers are attached silk flaps ZZ, those of one pair of rubbers descending, and those of the other pair ascending, in the direction in which the plate is worked. A piece of fine dry writing paper, as long as the rubber, and half an inch broader, so as to cover the seam that fastens the silk to the leather, allows greater pressure to be employed by diminishing the friction, and prevents both the glass and silk from being soiled by the amalgam, so that the excitement is more powerful, and the amalgam requires to be renewed less frequently. As the semicircular branch of the prime conductor is moveable, it may be made to exhibit the electricity of the rubber at any time, by placing the cylindrical ends in contact with the cushions, the semicircular wire I, being at the same time turned so as to cross it at right angles, which insulates the cushions. When the conductor is required to give electricity from the glass, the arc I must be in contact with the cushions, and the arc EE perpendicular to the horizon. It may not be improper here to mention the extraordinary large and powerful machine in Teyler's Museum at Haarlem; which was constructed by Mr. John Cuthbertson, an English mathematical instrument-maker. It consists of two circular plates of glass, each 65 inches in diameter, and made to turn upon the same horizontal axis, at the distance of $7\frac{1}{2}$ inches from one another. These plates are excited by 8 rubbers, each $15\frac{1}{2}$ inches long. Both sides of the plates are covered with a resinous substance to the distance of $16\frac{1}{2}$ inches from the centre, both to render the plates stronger, and likewise to prevent any of the electricity from being carried off by the axis. The prime conductor consists of several pieces, and is supported by three glass pillars 57 inches in length. The plates are made of French glass, as this is found to produce the greatest quantity of the electricity next to the English flint, which could not be produced of sufficient size. The conductor is divided into branches which enter between the plates, but collect the fluid by points only from one side of the plate. The force of two men is required to work this machine; but when it is required to be put in action for any length of time, four are necessary. At its first construction nine batteries were applied to it, each having fifteen jars, every one of which contained about a foot square of coated glass; so that the grand battery formed by the combination of all these contained 135 square feet. Dr. Van Marum, who principally made experiments with this machine, imagining that it was still capable of charging an additional quantity of coated glass, afterwards added to it 90 jars of the same size with the former; so that it now contains a coated surface of 225 feet, and the effects are found to be proportionable.

OF THE METHOD OF USING THE ELECTRICAL APPARATUS.

Young electricians often find cause to complain that the experiments described in treatises on electricity do not succeed with them, though possessed of very good apparatus for making them. Besides the want of practice, which time and patience can only supply, this is frequently owing to their not attending to some slight and seemingly trifling circumstances; such as dust or moisture about the instruments; some small part of them being out of

order; the weather being too hot, or rainy, or the like. The following directions should therefore be particularly attended to by every student of electricity: Until he has acquired a very considerable degree of perfection by practice and habit, he should not commence his operations in all kinds of weather. When the weather is clear and the air dry, especially if it be serene and frosty, the electrical machine will always work well. In such weather the young electrician will run no risk of being disappointed. But when the weather is very hot, the machine is not very powerful; nor will it work in damp weather, unless it be brought into a warm room, and the cylinder, stands, jars, discharges, &c. be made perfectly dry. Before the electrical machine is put in motion, examine those parts which are liable to wear, either from the friction of one surface against another, or to be injured by the dirt, that may insinuate itself between the rubbing surfaces. If any grating or disagreeable noise is heard, the place from whence it proceeds must be discovered, wiped clean, and rubbed over with a small quantity of tallow; a little of which should also be occasionally applied to the axis of the cylinder itself. The screws by which the frame is fixed should also be examined, and if they are loose, they should be made tight. The machine being examined and put in order, the glass cylinder, and the pillars which support the cushion and conductor, should be well wiped with a dry old silk handkerchief, to free them from the moisture which glass attracts from the air; being particularly attentive to leave no moisture on the ends of the cylinder, as any damp on these parts carries off the electric fluid, and lessens the force of the machine: in very damp weather it will be proper to dry the whole machine, by placing it at some little distance from the fire. Particular care should be taken that no dust, loose threads, or filaments, adhere to the cylinder, its frame, the conductors, or their insulating pillars; because these will gradually dissipate the electric fluid, and prevent the machine from acting powerfully. When satisfied of this, rub the glass cylinder first with a clean, coarse, dry, warm, cloth, or a piece of wash leather, and then with a piece of dry, warm soft silk; do the same to all the glass insulating pillars of the machine and apparatus; these pillars must be rubbed more lightly than the cylinder, because, being varnished, they may be damaged by too much friction. In some cases it is proper to place a hot iron on the foot of a conductor, to evaporate the moisture which would otherwise injure the experiments. After exciting the electrical machine, greasing the cylinder, and applying Dr. Higgins's amalgam, &c. as above described, proceed to work it by turning the winch or handle. When the prime conductors and other instruments are removed from the machine, it will soon be perceived, upon holding the knuckle of the fore-finger near the surface of the cylinder, that the electric fluid comes like a wind from the cylinder to the knuckle, and if the motion be continued, sparks and cracklings will soon follow. This indicates that the machine is in good order, and the electrician may proceed with his experiments. But if no wind be found upon the knuckle, the fault will probably be in the rubbers. To remedy this, loosen the screws on the back of the rubber, remove it from its glass pillar, and keep it a little near the fire, that its silk part may be dried; then pass a little tallow from a candle over the leather of the rubber, spread a small quantity of the amalgam over it, and force it into the leather as much as possible: after which, replace the rubber upon the glass pillar, and wipe the cylinder once more, and the machine will be fit for use. The following directions of Mr. Adams, relative to exciting the machine, will be found very useful. "To excite your machine, clean the cylinder, and wipe the silk. Grease the cylinder by turning it against a greasy leather, till it is uniformly obscured. The tallow of a candle may be used. Turn the cylinder till the silk flap has wiped off so much of the grease as to render it semi-transparent. Put some amalgam on a piece of leather, and spread it well, so that it may be uniformly bright: apply this against the turning cylinder, the friction will immediately increase, and the leather must not be removed until it ceases to become greater. Remove the leather, and the action of the machine will be very strong. The pressure of the cushion cannot be too small, when the excitation is properly made." Sometimes the machine will not work well because the rubber is not sufficiently supplied with electric fluid. This happens when the table upon which the machine stands, and with which the chain of the rubber is connected, is in a bad conducting state from being too dry.

dry. Even the floor and the walls of the room are, in very dry weather, bad conductors, and cannot supply the rubber sufficiently. In this case, the chain of the rubber must be connected by a long wire with some water, moist ground, or the iron work of a water-pump; which will soon supply the rubber with a sufficiency of the electric fluid. When the heat of the cylinder exceeds 110° , it will not act properly. If the machine does not work well, when a sufficient quantity of amalgam has been accumulated upon the leather of the rubber, then, instead of adding more amalgam, it will be proper to take off the rubber, and to scrape a little off that which is already upon the leather. The cylinder, when used for some time, frequently contracts black spots, occasioned by the amalgam or some foulness of the rubber. These spots must be carefully taken off, otherwise they will increase in size, and greatly obstruct the electric power of the cylinder: which, to prevent contracting them, must be often wiped. When any experiment is to be performed which requires but a small part of the apparatus, the remaining part of it should be placed at a distance from the machine, the prime conductor, and even from the table, if that is not very large. Candles, particularly, should be placed at a considerable distance from the prime conductor, for the effluvia of their flames carry off much of the electric fluid.

OF CHARGING AND DISCHARGING ELECTRIC JARS AND BATTERIES.

The phial being placed on the table, so that the ball on the top of its wire may be about one-eighth of an inch from the ball of the prime conductor, turn the machine, and sparks will fly from the ball of the conductor to the ball of the jar. Continue turning as long as you perceive the fire pass between the conductor and ball of the jar; but when it ceases, you may leave off turning, and consider the jar as charged. This done, take hold of the discharger by the middle, and apply one knob to the outside coating near the bottom, and keeping it there, put the other to the ball of the jar, and it will be discharged of its fire with a loud snap; but the person who holds the discharger feels nothing from the discharge. If you charge the jar again, and touch the outside coating with one hand, and then bring the other to the ball of the jar, you will act the part of the wire discharger, and receive a shock through your arms and breast, and the phial will be discharged. The same will be effected if a large company form a circle, by joining their hands, and the person at one extremity of the circle touch the outside coating, while he, who is at the other extremity, touches the ball of the jar. All the persons who form this circle are struck at the same time, and with the same degree of force nearly. If you place a Leyden bottle upon the insulated stand, forming a communication between it and the conductor, and give the machine a few turns, both sides of the bottle will be electrified with the positive electricity, as may easily be proved by touching them with down, or a small ball suspended by silk; for when this is electrified by touching the outside, it will be also repelled by the ball which communicates with the inner surface. Having placed an insulated bottle so that the ball may communicate with the conductor; let a wire also be connected with the coating, so as to form a communication with the table. Next turn the machine, and, 1. On applying a cork ball, you will not find any signs of electricity in the coating, but you will find the ball (or inside) electrified with the positive power. 2. Remove the wire communicating with the table, and you will find the coating also electrified with the positive power; and this as often as you remove the wire, till the bottle is full charged. 3. When the bottle is full charged, remove its communication both with the conductor and table, touch the coating, and the cork ball will remain suspended by it, without any sign of being electrified; then touch the knob of the bottle with your hand, the cork ball will be strongly repelled from the coating, and be electrified with negative electricity. 4. Take another cork ball suspended by silk, and touch the knob of the bottle therewith, and the cork ball will be electrified with positive electricity, and be repelled. 5. Now touch the coating with your finger, and the cork ball will be repelled much further by the ball; but that which was repelled from the coating, now flies towards it, and remains at rest, till you touch the knob of the bottle with your finger; it will then be electrified as at first, and be violently repelled; the ball which

was electrified by the knob of the bottle will now fly towards it. This change takes place almost instantaneously as often as the ball or coating is touched. The knob of the bottle may be made to connect with the conductor by a wire, suspending a cork ball so as to touch the conductor; then, on touching the coating, the ball will be repelled from the conductor, while that next the coating is attracted; touch the knob of the bottle, and the ball will be repelled from the coating, and attracted by the conductor, and so on as often as you please. In charging electric jars in general, it is to be observed, that every machine will not charge them equally high. Those machines which are strongest will always charge the jars highest. If the coated jars, before they are made use of, be made somewhat warm, they will receive and retain the charge better. If several jars be connected together, among which there is one that is apt to discharge itself very soon, then the other jars will also soon be discharged with it, although they may be capable of holding a very great charge by themselves. When electric jars are to be discharged, the electrician must be cautious, lest by some circumstance not adverted to, the shock should pass through any part of his body; for an unexpected shock, though not very strong, may occasion disagreeable accidents. In making the discharge, care must be taken that the discharging rod be not placed on the thinnest part of the glass, as that may cause the breaking of the jar. When a jar, and especially a battery, has been discharged, the electrician ought not to touch its wires with his hand, before the discharging rod be applied to its sides a second and even a third time; as there generally remains a residuum of the charge, which is sometimes very considerable. All the above-mentioned phenomena are the more remarkable in proportion to the power of the machine. That used in Teyler's Museum is astonishing in its effects, which are as follows: On presenting a very sharp steel point to the prime conductor, a luminous stream of about half an inch was perceived between them. On fixing the point to the conductor so as to project three inches from it, streams of light were thrown out from the point six inches long when a ball of three inches in diameter was presented, but only two inches in length on presenting another point. The sensation, called the spider's web, on the face of the bystanders is often felt at the distance of eight feet from the prime conductor. This is a sensation always produced by strong electricity, something resembling the creeping of insects or the motion of a light body, such as a spider's web, over the skin. It seems to proceed from the attraction and electrification of the small hairs with which the body is covered. A thread six feet long was sensibly attracted at the distance of thirty feet from the prime conductor, and a pointed wire appeared luminous at the distance of twenty-eight feet; a cork ball electrometer diverged at the distance of forty feet. A single spark from the conductor melted a considerable length of gold leaf; gunpowder and other combustibles, inclosed in a paper cartridge, with a sharp point in the middle, were fired; and when another conductor communicating with the earth was placed at the distance of twenty-one, or sometimes twenty-four inches from the prime conductor of the machine, a stream of fire was perceived between them. This was crooked, and darted out many lateral brushes of a very large size. A Leyden phial, containing about one square foot of coated surface, was so fully charged, by about half a turn of the winch, as to discharge itself; and by repeated trials it was found, that in one minute it discharged itself seventy-six, seventy-eight, and frequently eighty times. Lastly, it was found, that though the conductor, which received the sparks from the prime one of the machine, communicated with the earth by a wire three-eighths of an inch in diameter, this wire would give small sparks to any conducting body brought near it, as if even this wire had not been sufficient to conduct the quantity of electricity it received from the machine very readily to the earth.

EXPERIMENTS EXHIBITING ELECTRIC ATTRACTION AND REPULSION.

THE ELECTRIFIED CORK-BALL ELECTROMETER. Fix at the end of the prime conductor a knobbed rod, and hang on it two small cork-balls suspended by threads of equal length. The balls will now touch one another, the threads hanging perpendicularly, and parallel to each other. But if the cylinder of the machine be whirled by turning the winch, then the cork-balls will repel one another, more or less according as the electricity

city is more or less powerful. If the electrometer be hung to a prime conductor negatively electrified, *i. e.* connected with the insulated rubber of the machine, the cork balls will also repel each other. If, in this state of the repulsion, the prime conductor is touched with some conducting substance not insulated, the cork balls will immediately come together. But if, instead of the conducting substance, the prime conductor is touched with an electric, as a stick of sealing-wax, a piece of glass, &c. then the cork balls will continue to repel each other; because the electric fluid cannot be conducted through that electric; hence we have an easy method of determining what bodies are conductors and what electric. This electrical repulsion is also shewn by a large downy feather, which will appear beautifully swelled by the divergency of its down.

ATTRACTION AND REPULSION OF LIGHT BODIES. Connect with the prime conductor, by the hook H, the two parallel brass plates F, G, fig. 11, Plate LXIII. at about three inches from one another: and upon the lower plate put any kind of light bodies, as bran, bits of paper, bits of leaf gold, &c.; then work the machine, and the light bodies will soon move between the two plates, leaping alternately from one to the other with great velocity. If, instead of bran or irregular pieces of other matter, small figures of men or other things cut in paper and painted, or rather made of the pith of alder, be put upon the plate, they will generally move in an erect position, but will sometimes leap one upon another, or exhibit different postures, so as to afford a pleasing spectacle to an observing company. When bran or other substances of that kind are made use of, it will be proper to inclose both plates in a glass cylinder, by which the bran will be kept from dispersing and flying about the room. The phenomena of electric attraction and repulsion may be exhibited also with a glass tube, or a charged bottle, and some of them in a manner more satisfactory than with the machine.

The ELECTRICAL SPIDER, Fig. 12, Plate LXIII. represents an electric jar, having a wire C D E fastened on its outside, which is bended so as to have its knob E as high as the knob A.—B is a spider made of cork, with a few short threads run through it to represent its legs. It is fastened at the end of a silk thread, proceeding from the ceiling of the room, or from any other support, so that it may hang mid-way between the two knobs A and E, when the jar is not charged. Let the place of the jar upon the table be marked; then charge the jar, by bringing its knob A in contact with the prime conductor, and replace it in its marked place. The spider will now begin to move from knob to knob, and continue this motion for a considerable time, sometimes for several hours. The inside of the jar being charged positively, the spider is attracted by the knob A, which communicates to it a small quantity of electricity; the spider then becoming possessed of the same electricity with the knob A, is repelled by it, and runs to the knob E, where it discharges its electricity, and is then attracted by the knob A, and so on. Thus the jar is gradually discharged; and when the discharge is nearly completed, the spider finishes its motion.

The ELECTRICAL JACK is an invention of the celebrated Dr. Franklin's, and turns with considerable force, so that it may sometimes be used for the purposes of a common jack. A small upright shaft of wood passes at right angles through a thin round board of about 12 inches diameter, and turns on a sharp point of iron fixed in the lower end, while a strong wire in the upper end, passing through a small hole in a thin brass plate, keeps the shaft truly vertical. About 30 radii, of equal length, made of window glass cut into narrow slips, issue horizontally from the circumference of the board, the ends most distant from the centre being about four inches apart. On the end of every one a brass thimble is fixed. If now the wire of an electrified bottle be brought near the circumference of this wheel, it will attract the nearest thimble, and so put the wheel in motion. That thimble, in passing by, receives a spark; and thereby being electrified, is repelled, and so driven forwards; while a second, being attracted, approaches the wire, receives a spark, and is driven after the first; and so on, till the wheel has gone once round; when the thimbles before electrified approaching the wire, instead of being attracted, as they were at first, are repelled, and the motion presently ceases. But if another bottle which had been charged through the coating, or otherwise negatively electrified, is placed near the same wheel its wire will attract the thimble repelled by the first, and thereby

double the force that carries the wheel round. The wheel therefore moves very swiftly, turning 12 or 15 times in a minute, and with such force, that a large fowl spitted on the upper shaft may be roasted by it.

The SELF-MOVING WHEEL. This appears more surprising than the last experiment, though constructed upon the same principles. It is made of a thin round plate of window glass 17 inches in diameter, well gilt on both sides, all but two inches next the edge. Two small hemispheres of wood are then fixed with cement to the middle of the upper and under sides, centrally opposite; and in each of them a strong thick wire eight or ten inches long, which together make the axis of the wheel. It turns horizontally on a point at the lower end of its axis, which rests on a bit of brass cemented within a glass salt-cellar. The upper end of its axis passes through a hole in a thin brass plate, cemented to a long and strong piece of glass; which keeps it six or eight inches distant from any non-electric, and has a small ball of wax or metal on its top to keep in the fire. In a circle on the table which supports the wheel, are fixed 12 small pillars of glass, at about 11 inches distance, with a thimble on the top of each. On the edge of the wheel is a small leaden bullet, communicating by a wire with the gilding of the upper surface of the wheel; and about six inches from it is another bullet communicating in like manner with the under surface. When the wheel is to be charged by the upper surface, a communication must be made from the under surface to the table. As soon as it is well charged, it begins to move. The bullet nearest to a pillar moves towards the thimble on that pillar: and, passing by, electrifies it, and is then repelled from it. The succeeding bullet, which communicates with the other surface of the glass, more strongly attracts that thimble on account of its being electrified before by the other bullet; and thus the wheel increases its motion, till the resistance of the air regulates it. It will go half an hour; and make, one minute with another, 20 turns in a minute; which is 600 turns in the whole; the bullet in the upper surface giving in each turn 12 sparks to the thimbles, making in all 2500 sparks; while the same quantity of fire is thought to be received by the under bullet. The whole space moved over by these bullets in the mean time is 2500 feet. If, instead of two bullets, you put eight, four communicating with the upper, and four with the under surface, the force and swiftness will be greatly increased, and the wheel will make about 50 turns in a minute; but then it will not continue moving so long. These wheels may be applied to the ringing of chimes, and the moving of small orreries, &c.

The ELECTRIFIED BELLS, Fig. 13, Plate LXIII. represents an instrument having three bells, which are made to ring by electric attraction and repulsion. B is a brass rod, furnished with a ring, A, of the same metal, by which it is suspended from another rod fixed in the prime conductor. The outer bells C and E are suspended by brass chains; but the middle bell D and the two small brass clappers G and H are suspended by silk threads. From the concave under part of the bell D a chain proceeds, which falls upon the table, and has a silk thread F, at its extremity. When this apparatus is hung to the conductor by the ring A, and the cylinder of the machine gently turned, the clappers will fly from bell to bell with a rapid motion, and the bells will ring as long as they are kept electrified. The two bells C and E being suspended by brass chains are first electrified: hence they attract the clappers, communicate to them a little electricity, and repel them to the unelectrified bell D; upon which the clappers deposit their electricity, and move again to the bells C E, from which they acquire more, and so on. If, by holding the silk thread F, the chain of the middle bell be raised from the table, the bells after ringing a little while will stop; because the bell D will have no opportunity of conveying the electricity it receives from the clappers to the ground, being insulated by the silk thread. In the dark, sparks will be seen between the clappers and bells. Fig. 14 represents a set of bells more elegantly mounted, and which produce a better sound. In these the knob a must communicate with the conductor when the apparatus is made use of. Fig. 15 represents a set of eight bells otherwise constructed. The clapper h is here suspended by a silken thread from the fly a b c d: the axis of the fly rests in a small hole on the top of a glass pillar; and its upper part moves freely in, and is confined by a hole in the brass arm g. To make use of the bells these must be applied to the cylinder of the machine, or at least brought very near it when the con-

ductor is removed: so that the fly *abcd* may be about the height of the centre of the cylinder. The latter being then put in motion, the electricity from it proceeding to the fly, will cause it to turn round and the clapper attracted by each of the bells alternately in its rotation; which, if they are properly tuned, will produce a pleasing and harmonious sound.

EXPERIMENTS EXHIBITING ELECTRIC LIGHT and FIRE.

The following experiments require to be made in the dark: for although the electric light in several circumstances may be seen in the day-light, yet its appearance in this manner is very confused; and that the electrician may form a better idea of its different appearances, it is absolutely necessary to perform such experiments in a darkened room.

THE STAR and PENCIL of ELECTRIC LIGHT. When the electrical machine is in good order, and the prime conductor is situated with the collector sufficiently near the glass cylinder, turn the winch, and you will see a lucid star at each of the points of the collector. This star is the constant appearance of the electric fluid that is entering a point. At the same time you will see a strong light proceeding from the rubber, and spreading itself over the surface of the cylinder; and if the excitation of the cylinder is very powerful, dense streams of fire will proceed from the rubber, and, darting round almost half the circumference of the cylinder, will reach the points of the collector. If the prime conductor is removed, the dense streams of fire will go quite round the cylinder; reaching from one side of the rubber to the other. If the chain of the rubber is taken off, and a pointed body, for instance the point of a needle or a pin, be presented to the back of the rubber, at the distance of about two inches, a lucid pencil of rays will appear to proceed from the point presented, and diverge towards the rubber. If another pointed body be presented to the prime conductor, it will appear illuminated with a star; but if a pointed wire or other pointed conducting body be connected with the prime conductor, it will throw out a pencil of rays.

DRAWING SPARKS. Let the prime conductor be situated in its proper place, and electrify it by working the machine; then bring a metallic rod with a round knob at each end, or the knuckle of a finger, within a proper distance of the prime conductor, and a spark will be seen between that and the knuckle or knobbed wire. The longer and stronger spark is drawn from that end of the prime conductor which is farthest from the cylinder, or rather from the extremity of the knobbed rod fixed at its end. This spark appears like a long line of fire, reaching from the conductor to the opposed body, and often (particularly when the spark is long, and different conducting substances are near the line of its direction) it will have the appearance of being bended to sharp angles in different places resembling a flash of lightning. It often darts brushes of light sideways in every direction.

THE ARTIFICIAL LIGHTNING. Let two persons, one standing upon an insulated stool, and communicating with the prime conductor, and another standing upon the floor, each hold in one of his hands a metal plate, so that the plates may stand back to back in a parallel situation, and about two inches asunder. Let the winch of the machine be turned, and the flashes of light between the two plates will appear so dense and frequent, that one may easily distinguish any thing in the room. By this experiment the electric light is exhibited in a very copious and beautiful manner, and bears a striking resemblance to lightning.

TO FIRE INFLAMMABLE SPIRITS. The power of the electric spark to set fire to inflammable spirits, may be exhibited easily thus: Hang to the prime conductor a short rod having a small knob at its end; then pour some spirits of wine, a little warmed, into a spoon of metal; hold the spoon by the handle, and place it in such a manner, that the small knob on the rod may be about one inch above the surface of the spirits. In this situation, if, by turning the winch, a spark be made to come from the knob, it will set the spirits on fire. It will generally be found more advantageous to fix the dish containing the spirits upon the prime conductor, as represented fig. 16, Plate LXIII. This experiment may be varied different ways, and may be rendered very agreeable to a company of spectators. A person standing upon an electric stool, and communicating with the prime conductor, may hold the spoon with the spirits in his hand, and another person, standing upon the floor, may set the spirits on fire by bringing his finger within a small distance of it. Instead of his finger, he may fire the spirits with a

piece of ice, when the experiment will seem much more surprising. If the spoon is held by the person standing upon the floor, and the insulated person brings some conducting substance over the surface of the spirits, the experiment succeeds as well.

THE LUMINOUS CONDUCTOR. Fig. 17, Plate LXIII. represents a prime conductor invented by Mr. Henly, which shews clearly the direction of the electric fluid passing through it, from whence it is called the luminous conductor. The middle part EF of this conductor is a glass tube about 18 inches long and three or four inches in diameter. To both ends of this tube the hollow brass pieces FD, BE, are cemented air-tight, one of which has a point C, by which it receives the electric fluid, when set near the excited cylinder of the electrical machine, and the other has a knobbed wire G, from which a strong spark may be drawn; and from each of the pieces FD, BE, a knobbed wire proceeds within the cavity of the glass tube. The brass piece FD, or BE, is composed of two parts; *i. e.* a cap F cemented to the glass tube, and having a hole with a valve, by which the cavity of the glass tube is exhausted of air; and the ball D, which is screwed upon the cap F. The supporters of this instrument are two glass pillars fastened in the bottom board H, like the supporters of the prime conductor. When the glass tube of this conductor is exhausted of air by an air-pump, and the brass ball is screwed on, as represented in the figure, then it is fit for use, and may serve for a prime conductor to an electrical machine. If the point C of this conductor is set near the excited cylinder of the machine, it will appear illuminated with a star; at the same time the glass tube will appear all illuminated with a weak light; but from the knobbed wire that proceeds within the glass tube from the piece FD, a lucid pencil will issue out, and the opposite knob will appear illuminated with a star, which, as well as the pencil rays, is very clear, and discernible among the other light that occupies the greatest part of the cavity of the tube. If the point C, instead of being presented to the cylinder, be in contact with the rubber of the machine, the appearance of light within the tube will be reversed; the knob which communicates with the piece FD appearing illuminated with a star and the opposite one with a pencil of rays; because in this case the direction of the electric fluid is just the contrary of what it was before; it then going from D to B, and now coming from B and going to D. If the wires within the tube EF, instead of being furnished with knobs, be pointed, the appearance of light is the same; but it seems not so strong in this as in the other case.

THE CONDUCTING GLASS TUBE. Take a glass tube of about two inches diameter, and about two feet long; fix to one of its ends a brass cap, and to the other a stop-cock or a valve; then exhaust it of air by an air-pump. If this tube be held by one end, and its other end be brought near the electrified prime conductor, it will appear to be full of light whenever a spark is taken by it from the prime conductor, and much more so if an electric jar be discharged through it. This experiment may also be made with the receiver of an air-pump. Take a tall receiver, clean and dry, and through a hole at its top insert a wire, which must be cemented air-tight. The end of the wire within the tube must be pointed, but not very sharp; and the other end must be furnished with a knob. Put this receiver upon the plate of the air-pump, and exhaust it. If now the knob of the wire at the top of the receiver be touched with the prime conductor, every spark will pass through the receiver in a dense and large body of light, from the wire to the plate of the air-pump. When the air-pump, or any thing not very portable, is to be touched with the prime conductor, the communication between them may be made by means of a rod furnished with an electric handle.

THE ARTIFICIAL AURORA BOREALIS. Take a phial nearly of the shape and size of a Florence flask; (fig. 18, Plate LXIII.) fix a stop-cock or a valve to its neck, and exhaust it of air as much as possible with a good air-pump. If this glass be rubbed in the common manner used to excite electrics, it will appear luminous within, being full of a flashing light, which plainly resembles the aurora borealis or northern light. This phial may also be made luminous, by holding it by either end, and bringing the other end to the prime conductor; in this case, all the cavity of the glass will instantly appear full of flashing light, which remains in it for a considerable time after it has been removed from the prime conductor. Instead of the glass phial a glass tube exhausted of air and hermetically sealed may be used, and perhaps with more advantage. The most remarkable circumstance of this experiment is,

that

that if the phial, or tube, after it has been removed from the prime conductor (and even several hours after its flashing light has ceased to appear), be grasped with the hand, strong flashes of light will immediately appear within the glass, which often reach from one end of it to the other.

The **VISIBLE ELECTRIC ATMOSPHERE**, is an experiment of Signior Beccaria. GI, fig. 19, Plate LXIII. represents the receiver with the plate of an air-pump. In the middle of the plate IF, a short rod is fixed, having at its top a metal ball B nicely polished, whose diameter is nearly two inches. From the top of the receiver, another rod AD, with a like ball A, proceeds, and is cemented air-tight in the neck C; the distance of the balls from one another being about four inches, or rather more. If, when the receiver is exhausted of air, the ball A be electrified positively, by touching the top D of the rod AD with the prime conductor, or an excited glass tube, a lucid atmosphere appears about it, which although it consists of a feeble light, is yet very conspicuous, and very well defined; at the same time, the ball B has not the least light. This atmosphere does not exist all round the ball A; but reaches from about the middle of it, to a small distance beyond that side of its surface which is next the opposite ball B. If the rod with the ball A be electrified negatively, then a lucid atmosphere, like the above described, will appear upon the ball B, reaching from its middle to a small distance beyond that side of it that is towards the ball A; at the same time, the negatively electrified ball A remains without any light. The operator in this experiment must take care not to electrify the ball A too much; else the electric fluid will pass in a spark from the one ball to the other, and the experiment will fail. "By this elegant experiment of the celebrated F. Beccaria, says Mr. Cavallo, we have an ocular demonstration of the theory of a single electric fluid. We see that electricity consists of one uniform homogeneous fluid, and not of two, viz. the vitreous and resinous, as some have supposed; for, if the positive and negative electricity were two distinct fluids, attractive of one another, there should in the above experiment always appear two atmospheres, *i. e.* one about the ball A, and another about the ball B; for when the ball A is overcharged with either fluid, it should shew that superfluous fluid on its surface, and this fluid should attract towards the ball A an atmosphere of the contrary fluid from the ball B. But this is not the case, for the lucid atmosphere is always on one ball, namely, that which is overcharged with the electric fluid: thus when the ball A is electrified positively, the superfluous fluid is visible on that part of it which is nearest to the ball B, because B, being in a contrary state of electricity, endeavours to attract it; but when the ball A is electrified negatively, it will attract the fluid proper to the ball B, which fluid on that account appears on the surface of B, just in the act of leaping to the ball A."

The **SPIRAL TUBES**. Fig. 20, Plate LXIII. represents an instrument composed of two glass tubes CD, one within another, and closed with two knobbed brass caps A and B. The innermost of these has a spiral row of small round pieces of tin-foil stuck upon its outside surface, and lying at about one-30th of an inch from each other. If this instrument be held by one of its extremities, and its other extremity be presented to the prime conductor, every spark it receives from the prime conductor will cause small sparks to appear between all the round pieces of tin-foil stuck upon the innermost tube; which in the dark affords a pleasing spectacle, the instrument appearing encompassed by a spiral line of fire. Fig. 21 represents several spiral tubes placed round a board, in the middle of which is screwed a glass pillar, and on the top of this pillar is cemented a brass cap with a fine steel point. In this a brass wire turns, having a brass ball at each end, nicely balanced on the wire. To make use of this apparatus, place the middle of the turning wire under a ball proceeding from the conductor, so that it may receive a succession of sparks from the ball; then push the wire gently round; and the balls in their relative motions will give a spark to each tube, and thereby illuminate them down to the board, which from its brilliancy and rapid motion affords a most beautiful and pleasing sight. The small pieces of tin-foil are sometimes stuck on a flat piece of glass ABCD, fig. 22, so as to represent various fanciful figures. Upon the same principle is the luminous word **LIGHT** produced. It is formed by the small separations of the tin-foil pasted on a piece of glass fixed in a frame of baked wood, as represented fig. 23. To use this, the frame

must be held in the hand, and the ball G presented to the conductor. The spark then will be exhibited in the intervals composing the word; from whence it passes to the hook at *h*, and thence to the ground by a chain. The brilliancy of this is equal to that of the spirals. A similar effect will be produced by the jar, fig. 8, Plate LXIV, coated by detached pieces of tin-foil; it will exhibit the electric light passing from piece to piece, both while charging and discharging.

TO FIRE A PISTOL OR CANNON BY INFLAMMABLE AIR. Fig. 24 represents a brass pistol for inflammable air. It consists principally of a chamber, to the mouth D of which a cork is fitted: a glass tube F is cemented into the top of the chamber, through which a brass wire passes, and is bent within side so as to approach within an 8th part of an inch of the side. On the outside end of this wire is screwed a brass ball A, which serves to receive a spark from the conductor of the machine, and conduct it in that form to the inside of the pistol. The inflammable air with which the pistol is to be charged may be made in a common stone-ware or glass bottle, by mixing a handful of iron-filings with about two wine-glassfuls of water and near one of oil of vitriol. The air, when thus made, should be kept in a bottle corked up. To use the pistol, take out the cork from the bottle, and instantly apply the mouth of the pistol to the mouth of the bottle; and in about ten seconds it will be sufficiently charged: then remove it, and cork both the pistol and bottle with the utmost expedition: then bring the ball A near the prime conductor or the knob of a charged jar; and the spark that passes through the ball, and between the end of the wire within the side of the chamber, will fire the inflammable air with a loud report, and drive the cork to a considerable distance. Instruments to fire inflammable air are often made in the form of a cannon with its carriage, as in fig. 25.

TO ILLUMINATE IVORY OR BOX-WOOD. Place an ivory ball on the prime conductor of the machine, and take a strong spark, or send the charge of a Leyden bottle through its centre, the ball will appear perfectly luminous; but if the charge be not taken through the centre, it will pass over the surface of the ball and corrode it. A spark taken through a ball of box-wood not only illuminates the whole, but makes it appear of a beautiful crimson or rather fine scarlet colour.

TO ILLUMINATE WATER. Connect one end of a chain with the outside of a charged jar, and let the other lie upon the table. Place the end of another piece of chain at about one quarter of an inch from the former; then set a decanter of water on these separated ends; and on making a discharge, the water will appear perfectly and beautifully luminous.

EXPERIMENTS WITH THE LEYDEN PHIAL.

The **LEYDEN VACUUM** is an invention of the late Mr. Henly. Fig. 26 and 27, Plate LXIII. represent two small phials coated on the outside, about three inches up the sides, with tin-foil; at the top of the neck of each, a brass cap is cemented, having a hole with a valve, and from the cap a wire proceeds a few inches within the phial, terminating in a blunt point. When this phial is exhausted of air, a brass ball is screwed upon the brass cap, which is cemented into its neck, so as to defend the valve, and prevent any air from getting into the exhausted glass. This phial exhibits clearly the direction of the electric fluid, both in charging and discharging; for if it be held by its bottom, and its brass knob be presented to the prime conductor positively electrified, it will be seen that the electric fluid causes the pencil of rays to proceed from the wire within the phial, as represented fig. 26; and if it is discharged, a star will appear in the place of the pencil, as represented in fig. 27. But if the phial is held by the brass cap, and its bottom be touched with the prime conductor, then the point of the wire on its inside will appear illuminated with a star when charging, and with a pencil when discharging. If it be presented to a prime conductor electrified negatively, all these appearances, both in charging and discharging, will be reversed.

The **APPARATUS**, represented fig. 7, Plate LXIV. will be found very convenient for the various experiments upon the luminous conductor, Leyden vacuum, jars charged positively or negatively, with their different states of insulation. A is an insulating pillar of glass, which is screwed to the wooden foot B; and on this pillar all the apparatus may be screwed alternately. CD is an exhausted tube of glass, furnished at each end with brass caps; at the

end D is a valve properly secured under the brass plate; a brass wire with a ball projects from the upper cap; a pointed wire proceeds from the bottom plate; and this tube is called the luminous conductor. The flask represented at E is called the Leyden Vacuum. It is furnished with a valve under the ball E; to come at which the more readily, the ball may be unscrewed: a wire, with a blunt end, projects to within a little of the bottom of the flask, the latter being coated with tin-foil: and a female screw is cemented to the bottom, to screw it on the pillar A.—F is a syringe to exhaust the air occasionally, either from the luminous conductor or the Leyden vacuum. To do this, unscrew the ball of the Leyden vacuum, or the plate of the luminous conductor, and then screw the syringe in the place of either of these pieces, being careful that the bottom of the female screw G bears close against the leather which covers the shoulders *ab* or *ed*; then work the syringe, and in a few minutes the glasses will be sufficiently exhausted. H and I are two Leyden bottles; each of which has a female screw fitted to the bottom, that they may be conveniently screwed on the pillar A; and the bottle H is furnished with a belt by which it may be screwed sidewise to the same. K and L are two small wires, to be screwed occasionally either into the ball E, the knobs *c* or *f*, the cap C, or the socket *g* on the top of the pillar: the balls may be unscrewed from these wires, which will then exhibit a blunt point. M is a wooden table to be screwed occasionally on the glass pillar.

TO PIERCE VARIOUS SUBSTANCES WITH THE ELECTRIC EXPLOSION. Take a card, a quire of paper, or the cover of a book, and keep it close to the outside coating of a charged jar; put one knob of the discharging rod upon the card, quire of paper, &c. so that between the knob and coating of the jar the thickness of that card, or quire of paper, only is interposed; lastly, by bringing the other knob of the discharging rod near the knob of the jar, make the discharge, and the electric matter will pierce a hole (or perhaps several) quite through the card or quire of paper. This hole has a bur raised on each side, except the card, &c. be pressed hard between the discharging rod and the jar; which shews that the hole is not made in the direction of the passage of the fluid, but in every direction from the centre of the resisting body. If instead of paper, a very thin plate of glass, rosin, sealing-wax, or the like, be interposed between the knob of the discharging rod and the outside coating of the jar, on making the discharge, this will be broken in several pieces. Small insects may also be killed in this manner. They may be held between the outside coating of the jar and the knob of the discharging rod, like the above card; and a shock of a common phial sent through them, will instantly deprive them of life, if they are pretty small; but if larger, they will be affected in such a manner, as to appear quite dead on first receiving the stroke; but will, after some time, recover: this, however, depends on the quantity of the charge sent through them.

EFFECT OF THE SHOCK SENT OVER THE SURFACE OF A CARD OR GLASS. Put the extremities of two wires upon the surface of a card, or other body of an electric nature, so that they may be in one direction, and about one inch distant from one another; then, by connecting one of the wires with the outside of a charged jar, and the other wire with the knob of the jar, the shock will be made to pass over the card or other body. If the card be made very dry, the lucid track between the wires will be visible upon the card for a considerable time after the explosion. If a piece of common writing paper be used instead of the card, it will be torn by the explosion into very small bits. If the explosion be sent over the surface of a piece of glass, it will be marked with an indelible track, which generally reaches from the extremity of one of the wires to the extremity of the other. In this manner, the piece of glass is very seldom broken by the explosion. But Mr. Henly discovered a very ingenious method to increase the effect of the explosion upon the glass, by pressing with weights that part of the glass which lies between the two wires, *i. e.* the part over which the shock is to pass. He put a thick piece of ivory upon the glass, and placed upon it a weight, from one quarter of an ounce to six pounds. The glass in this manner is generally broken by the explosion into innumerable fragments, and some of it is absolutely reduced into an impalpable powder. If the glass be very thick, and resist the force of the explosion, so as not to be broken, it will be marked with the most lively prismatic colours, which are thought to be occasioned by very thin laminæ of the glass, partly

separated from it by the shock. The weight laid upon the glass is always shaken by the explosion, and sometimes it is thrown quite off from the ivory. This experiment may be most conveniently made with the universal discharger, fig. 7, Plate LXIII. In this experiment, Mr. Cavallo says, "if small representations of houses, &c. be laid upon a board, placed on the piece of ivory, that, being shook by the explosion, will give a very natural idea of an earthquake." As to the direction of the electric fluid, the following experiments have been thought to prove directly the passage of the fluid outward from the positive and inward to the negative side of the phial. Fig. 8, Plate LXIV. represents an electric jar, whose exterior coating is made up of small pieces of tin-foil placed at a little distance from each other. It is to be charged in the usual manner, when small sparks of the electric fluid will pass from one piece of tin-foil to the other, in various directions, forming a very pleasing spectacle. The separation of the tin-foil is the cause of this visible passage of the fluid from the outside to the table, and the experiment is similar in appearance to that of the spiral tube above-mentioned. If the jar be discharged by bringing a pointed wire gradually to the knob, T, the unsealed part of the glass between the wire and knob will be agreeably illuminated with a crackling noise of the sparks. If the jar be suddenly discharged, the whole outside will be illuminated. The jar, in this experiment, must be very dry when used. Fig. 22 represents two jars, or Leyden phials, placed one over the other, by which several curious experiments may be made. Bring the outside coating of the bottle A in contact with the prime conductor, and turn the machine till the bottle is charged; then place one ball of the discharging rod upon the coating of B, and with the other touch the knob of the jar A, which will cause an explosion; now place one ball of the discharger on the knob A, and bring the other ball to its coating, and you have a second discharge. Again, apply one ball of the discharger to the coating of B, and carry the other to the coating of A, and it will produce a third discharge. A fourth is obtained by applying the discharger from the coating of A to its knob. The outer coating of the upper jar communicating with the inside of the upper one, conveys the fluid from the conductor to the large jar, which is therefore charged positively: the upper jar does not charge, because the inside cannot part with any of its electric fluid; but when a communication is formed from the outside of A to the inside of B, part of the fire on the inside of A will be conveyed to the negative coating of B, and the jar will be discharged. The second explosion is occasioned by the discharge of the jar A; but as the outside of this communicates, by conducting substances, with the positive inside of the jar B, if the ball of the discharging rod remain for a little time after the discharge on the knob of A, part of the fire of the inside of A will escape, and be replaced by an equal quantity on the outside from the jar B, by which means A is charged a second time; the discharge of this produces the third, and of B the fourth explosion. Fig. 23 is an electric jar, which serves to illustrate the direction of the fluid while charging a Leyden phial. BB is the tin-foil coating; C a stand which supports the jar; D a socket of metal, carrying the glass rod E, a bent brass wire pointed at each end, and fixed at the end of the rod G; which rod is moveable in the spring tube N at pleasure: that tube being fixed by a socket on the top of the glass rod E the jar is charged by the inside wire, which communicates with the different divisions of the inside coating by horizontal wires. Place the jar to the conductor as usual; and, when charging, a luminous speck will appear upon the upper point of the wire at F, clearly shewing, according to the commonly received opinion, that the point is then receiving the electric fluid. From the upper ring of the coating B, on the outside of the jar, a fine stream or pencil of rays will at the same time fly off, beautifully diverging from the lower point of the wire F upon the bottom ring of the coating of the jar. When the appearances cease, which they do when the jar is charged, let a pointed wire be presented towards the conductor: this will soon discharge the jar silently; during which the point will be illuminated with a small spark, while the upper point of the wire will throw off a pencil of rays diverging towards the upper ring of the coating.

TO DISCHARGE A JAR SILENTLY.

When a large jar is fully charged, which would give a terrible shock, put one of your hands in contact with its outside coating; with

with the other hold a sharp-pointed needle, and keeping the point directed towards the knob of the jar, proceed gradually near it, until the point of the needle touches the knob. This operation discharges the jar entirely; and you will either receive no shock at all, or so small a one as can hardly be perceived. The point of the needle, therefore, has silently and gradually drawn all the superfluous fluid from the inside surface of the electric jar.

THE ELECTRIFIED COTTON.

Take a small lock of cotton, extended in every direction as much as conveniently can be done; and by a linen thread about five or six inches long, or by a thread drawn out of the same cotton, tie it to the end of the prime conductor: then turn the winch of the machine, and the lock of cotton, on being electrified, will immediately swell, by repelling its filaments from one another, and will stretch itself towards the nearest conductor. In this situation let the winch be kept turning, and present the end of your finger, or the knob of a wire, towards the lock of cotton, which will then immediately move towards the finger, and endeavour to touch it; but take with the other hand a pointed needle, and present its point towards the cotton, a little above the end of the finger, and you will observe the cotton immediately to shrink upward, and move towards the prime conductor. Remove the needle, and the cotton will come again towards the finger. Present the needle, and the cotton will shrink again, which clearly proves that the needle draws off the electric fluid from the cotton.

THE ELECTRIFIED BLADDER.

Take a large bladder well blown, and cover it with gold, silver, or brass leaf, sticking it with gum-water: suspend it at the end of a single thread, at least six or seven feet long, hanging from the ceiling of the room; and electrify the bladder, by giving it a strong spark with the knob of a charged bottle: this done take a knobbed wire, and present it to the bladder when motionless; and you will perceive, that as the knob approaches the bladder, the bladder also moves towards the knob, and, when nearly touching it, gives it the spark which it received from the charged phial, and thus it becomes unelectrified. Give it another spark, and, instead of the knobbed wire, present the point of a needle towards it, and the bladder will not be attracted by, but rather recede from, the point, especially if the needle be very suddenly presented towards it. This is one of Mr. Henry's experiments.

THE DANCING BALLS.

Fix a pointed wire upon the prime conductor, with the point outward; then take a glass tumbler, grasp it with your hands, and present its inside surface to the point of the wire upon the prime conductor while the machine is in motion: the glass in this manner will soon become charged; for its inside surface acquires the electricity from the point, and the hands serve as a coating for the outside. This done put a few pith balls upon the table, and cover them with this charged glass tumbler. The balls will immediately begin to leap up along the sides of the glass as represented, fig. 1, Plate LXIV. and will continue their motion for a considerable time.

THE ELECTRIC FLIES.

These flies are composed of small brass wires, figs. 2 and 3, Plate LXIV. fixed into a cap of brass, easily moveable upon an axis of the same metal, and exactly balanced, so that they may turn with the smallest force. The ends, which ought to be very sharp, are all bent one way, with regard to one another, as those belonging to *a, b*, in the figure; though the two sets of points constituting the two flies there represented, are contrary to each other; so that the whole flies must have a contrary motion. Fixing the axle with the two flies upon the prime conductor, and working the machine, both will begin to turn very swiftly, each in a direction contrary to that of the points. In this manner, with a powerful machine, several flies may be made to turn either in the same or in contrary directions; and by their gradual increase or decrease in size may represent a cone or other figure; for the course of each will be marked by a line of fire, and thus the whole will exhibit a beautiful appearance in the dark. The light is said to be more brilliant when the ends are slightly covered with sealing-wax, grease, or other electric matter. The flies, in this expe-

rimment, turn the same way whether the electricity be positive or negative; the reason will easily be conceived from the theory above laid down, viz. that in positive electricity the fluid issues from the body electrified, and that in negative electricity it enters into it. In the former case, the force of the fluid, which acts equally on the air and on the point from whence it issues, must continually put the point the contrary way; and in negative electricity, when the point solicits a continual draught of electric matter from the air, the direct impulse of the former must also produce a motion in the point in the course in which the fluid itself moves. In vacuo no motion is produced; because there is no air on which the fluid may act when it issues from the point. In like manner, when air is inclosed in a glass vessel, the motion of the electric fly soon stops; because the air and the glass soon becomes so much electrified, that the escape of the fluid from the point is prevented, and therefore its motions are impeded, and in a little time entirely stopped. On applying a conductor to the outside of the glass, the fly renews its motion; because an opportunity is now given to the fluid to escape, by running through the glass. But this must soon cease, because, when the glass is thus charged, no more can be carried from the outside. Fig. 4 shews another fly which turns perpendicularly by the same electric power. By means of the stream of electricity issuing from a point, many other amusing experiments have been contrived: such is the electrical orrery, shewing the motion of the sun, earth, and moon. The sun and earth go round the common centre of gravity between them in a solar year; and the earth and moon go round the common centre of gravity between them in a lunar month. These motions are represented by an electrical experiment as follows: The ball *S*, fig. 5, represents the sun, *E* the earth, and *M* the moon, connected by wires *a c* and *b d*: *b* is the centre of gravity between the earth and moon. These three balls, and their connecting wires, are hung and supported on the sharp point of a wire *A*, so that the whole may turn on the point *a*. In like manner *E* and *M* are supported at the point *b*, round which they turn. And as *E* and *M* are light when compared with *S* and *E*, there is much less friction on the point *b*, than on the point *a*. The weights of the balls may be adjusted so, that *E* and *M* may go twelve times round *b*, in the time that *S* and *E* go once round *a*. This affords an amusing experiment in electricity; but it is so far from proving that the motions of the planets in the heavens are owing to a like cause, that it plainly proves they are not; for the real sun and planets are not connected by wires or bars of metal, and consequently there can be no such metallic points as *c* and *d* between them. And without such points, the electric fluid would never cause them to move; for, take away these points in the above-mentioned experiment, and the balls will continue at rest, let them be ever so strongly electrified. Fig. 6 represents a water-mill for grinding corn, turned by a stream of electricity. *A* is the water-wheel, *B* the cog-wheel on its axis, *C* the trundle turned by that wheel, and *D* the running mill-stone on the top of the axis of the trundle. It may easily be contrived and turned also by electricity, if instead of the round plate *D* for the mill-stone, there is a horizontal wheel on the trundle *C*, with spur-cogs, which will turn two trundles placed on its opposite sides: and on the top of each of these trundles' axis, may be a round plate representing a mill-stone; so that this model has all the working parts of a double water-mill, turning two mill-stones. Set the mill near the prime conductor, and place the crooked wire so that its point may be directed towards the uppermost side of the great wheel *A*. Then turn the glass globe by the winch, and the stream of fire that issues from the point of the wire will turn the wheel, and consequently all the other working parts of the mill. Small boats or swans are sometimes made of light wood or cork, and they may be attracted and made to swim in any direction, by applying a finger towards them; or they may have the addition of sails, and will then be made to sail briskly before an electrical gale from a wire held in the hand of the operator.

THE THUNDER HOUSE.

Fig. 9, Plate LXIV. is an instrument representing the side of a house, either furnished with a metallic conductor, or not; by which both the bad effects of lightning striking upon a house not properly secured, and the usefulness of metallic conductors, may be clearly represented. *A* is a board about three quarters of an

†

inch

inch thick, and shaped like the gable end of a house. This board is fixed perpendicularly upon the bottom board B, upon which the perpendicular glass pillar, C D, is also fixed in a hole about eight inches distant from the basis of the board A. A square hole I L M K, about a quarter of an inch deep, and nearly one inch wide, is made in the board A, and is filled with a square piece of wood; which is made nearly of the same dimensions, because it must go so easily into the hole, that it may drop off by the least shaking of the instrument. A wire L K is fastened diagonally to this square piece of wood. Another wire I H of the same thickness, having a brass ball H, screwed on its pointed extremity, is fastened upon the board A; so also is the wire M N, which is shaped in a ring at O. From the upper extremity of the glass pillar C D, a crooked wire proceeds, having a spring-socket F, through which a double knobbed wire slips perpendicularly, the lower knob G of which falls just above the knob H. The glass pillar D C must not be made very fast into the bottom board; but it must be fixed so as it may be pretty easily moved round its own axis; by which means the brass ball G may be brought nearer or farther from the ball H, without touching the part E F G. Now when the square piece of wood L M I K (which may represent the shutter of a window or the like) is fixed into the hole so, that the wire L K stands in the dotted representation I M, then the metallic communication from H to O is complete, and the instrument represents a house furnished with a proper metallic conductor: but if the square piece of wood L M I K is fixed so, that the wire L K stands in the direction L K, as represented in the figure, then the metallic conductor H O, from the top of the house to its bottom, is interrupted at I M, in which case the house is not properly secured. Fix the piece of wood L M I K so, that its wire may be as represented in the figure, in which case the metallic conductor H O is discontinued. Let the ball G be fixed at about half an inch perpendicular distance from the ball H; then, by turning the glass pillar D C, remove the former ball from the latter; by a wire or chain connect the wire E F with the wire Q of the jar P, and let another wire or chain, fastened to the hook O, touch the outside coating of the jar. Connect the wire Q with the prime conductor, and charge the jar; then, by turning the glass pillar D C, let the ball G come gradually near the ball H; and when they are arrived sufficiently near one another, the jar will explode, and the piece of wood L M I K will be pushed out of the hole to a considerable distance from the thunder house. Now the ball G, in this experiment, represents an electrified cloud, which, when it is arrived sufficiently near the top of the house A, the electricity strikes it; and as this house is not secured with a proper conductor, the explosion breaks off a part, *i. e.* knocks off the piece of wood I M. Repeat the experiment with only this variation, *viz.* that this piece of wood I M is situated so, that the wire L K may stand in the situation I M, in which case the conductor H O is not discontinued; and then the explosion will have no effect upon the piece of wood L M, this remaining in the hole unmoved; which shews the usefulness of the metallic conductor. Again, unscrew the brass ball H from the wire I H, so that this may remain pointed. With this difference only in the apparatus, repeat both the above experiments; and you will find that the piece of wood I M is in neither case moved from its place, nor any explosion will be heard; which not only demonstrates the preference of the conductors with pointed terminations to those with blunted ones; but also shews that a house furnished with sharp terminations, although not furnished with a regular conductor, is almost sufficiently guarded against the effects of lightning. This apparatus is sometimes made in the shape of a house, as represented fig. 10, where, for the sake of distinctness, the side and part of the roof next the eye are not represented. The gable end A C represents that of the thunder house, and may be used in the same manner with that above described, or more readily by the following method. Let one ball of the discharging rod touch the ball of the charged jar, and the other the knob A of the conductor A C of the thunder house: the jar will then of course explode, and the fluid will act upon the conductor just mentioned. The conducting wire at the windows *h h* must be placed in a line. The sides and gable, A C, of the house, are connected with the bottom by hinges; and the building is kept together by a ridge on the roof. To use this model, fill the small tube *a* with gunpowder, and ram the wire *c* a little way into the

tube; then connect the tube *c* with the bottom of a large jar, or battery. When the jar is charged, from a communication from the hook at C, on the outside, to the top of the jar, by the discharging rod; the discharge will fire the powder, and the explosion of the latter will throw off the roof, with the sides, back, and front, so that they will all fall down together. Fig. 11 represents a small ramrod for the tube *a*, and fig. 12 a pricker for the touch-hole at C. Fig. 13 represents a mahogany pyramid, by means of which the same experiment may be exhibited. It is used in a manner similar to that just now described, the piece at *a* being thrown out by the discharge; by which means the upper part falls down in three pieces. Mr. Jones of Holborn makes the front of the common thunder houses, as well as the powder house above described, with two pieces of wood or windows *h h*, which, by being placed in proper situations, the one to conduct and the other to resist the fluid, will illustrate by one discharge the usefulness of good conductors for securing buildings or magazines from the explosion of thunder, as well as the danger of using imperfect ones.

To shew that the ELECTRIC FLUID prefers a SHORT PASSAGE through the air, to a LONG one through good conductors, Dr. Priestley invented the following experiment: Bend a wire about five feet long in the form represented in fig. 14, Plate LXIV. so that the parts A and B may approach within half an inch of each other; and connect its extremities with the hook of the battery, and the discharging rod. Upon sending the explosion of a battery through it, a spark will be seen between A and B, which proves that the electric fluid, prefers the short passage through the air to the long one through or along the wire. The whole charge, however, does not run from A to B, but part of it runs through the wire, which is proved by placing a slender wire between A and B; for with only this addition to the apparatus, the small wire will be scarcely made red-hot; whereas if the large bent wire be cut at C, so as to interrupt the circuit A C B, the small wire will be melted, and even exploded, by the same charge which, before the wire was cut, hardly made it red hot. By this experiment Dr. Priestley says, the different degrees of conducting power in different metals may be tried, by using metallic circuits of equal length and thickness, and observing the difference of the passage in each through the air. Dr. Van Marum, by the grand electrical machine and battery in Teyler's Museum at Haarlem, tried to communicate magnetism to needles made out of watch springs of three, and even six, inches in length; as well as to steel bars nine inches long, from a quarter to half an inch in breadth, and about the twelfth part of an inch in thickness. The result was, that when the bar or needle was placed horizontally in the magnetic meridian, which ever way the shock entered, the end of the bar that stood toward the north acquired the north polarity, and the opposite end acquired the south. If the bar, before it received the shock, had some polarity, and was placed with its poles contrary to the usual direction, then its natural polarity was always diminished, and often reversed; so that the extremity of it, which in receiving the shock looked towards the north, became the north pole, &c. When the bar or needle was struck standing perpendicularly, its lowest end became the north pole, in any case, even when the bar had some magnetism before, and was placed with the south pole downwards. All other circumstances being alike, the bars seemed to acquire an equal degree of magnetic power, whether they were struck while standing horizontally in the magnetic meridian, or perpendicular to the horizon. When a bar or needle was placed in the magnetic equator, whichever way the shock entered, it never gave it any magnetism; but if the shock was given through its width, then the needle acquired a considerable degree of magnetism, and the end of it which lay towards the west became the north pole, and the other end the south pole. If a needle or bar, already magnetic, or a real magnet, was struck in any direction, its power was always diminished. For this experiment they tried considerable large bars; one being 7.08 inches long, 0.26 broad, and 0.05 thick. When the shock was so strong, in proportion to the size of the needle, as to render it hot, then the needle generally acquired no magnetism at all, or very little. To determine whether electricity and fire act upon metals in the same manner, Dr. Van Marum caused wires of different metals to be drawn through the same hole, of one-thirty-eighth part of an inch in diameter, and observed how many inches of each could be melted by the explosion of his battery; taking care, in all these experiments,

to charge it to the same degree as ascertained by his electrometer. The results were as follow:—Of lead he melted 120 inches; of tin 120; of iron 5; of gold $3\frac{1}{2}$; of silver, copper, and brass, not quite a quarter of an inch. These different lengths of wire, of the same diameter, melted by equal explosions, indicate, the Dr. thinks, the degree in which each metal is fusible by the electrical discharge. On comparing these with the fusibility of the same metals by fire, a very considerable difference will be observed. By the experiments of the academicians of Dijon, to melt tin required a heat of 170° of Reaumur's thermometer; lead 230; silver 430; gold 563; copper 630; and iron 696. Thus tin and lead appear to be equally fusible by electricity, but not by fire; and iron, which by fire is less fusible than gold, is much more so by the electrical explosion. From these and some other experiments of the same kind, Dr. Van Marum concludes, that, in melting metals, the electrical fluid acts upon them in a manner very different from the action of fire, and that the supposed analogy between these two powerful agents cannot be proved, either from the fusion of metals, or the ignition of combustible substances.

OF THE ELECTRICAL KITE.

The justly celebrated Dr. Franklin was the first who made use of the electrical kite, to draw the electric fluid from the clouds. Since his first successful attempt, various methods have been tried by different electricians to improve the construction of this instrument. The most convenient size is found to be about four feet in length, and two in breadth: and the best covering is common varnish, or well boiled linseed oil. Paper for the body of the kite is preferable to silk or linen, both for convenience and cheapness. But, though some eminent electricians cover the back part of the straiter with tin-foil, and furnish its upper extremity with a slender pointed wire, to draw the electricity from the clouds more effectually; yet it is acknowledged, that in general neither of these improvements affect the electricity at the string, or increase it in the smallest degree. Mr. Cavallo, who has made many experiments in atmospherical electricity, observes that the whole power of this machine lies in the string. A common school boy's kite answers the purpose as well as any other. The best method of making the string is by twisting two threads of common twine with one of that copper thread which is used for trimmings. When a kite constructed in this manner was raised, he says, he always observed the string to give signs of electricity, except once. The weather was warm, and the wind so weak, that the kite was raised with difficulty, and could hardly be kept up for a few minutes. Afterwards, however, when the wind increased, he obtained, as usual, a pretty strong positive electricity. Concerning the management of this kite he gives the following directions: "In raising the kite, when the weather is very cloudy and rainy, in which time there is danger of meeting with a great quantity of electricity, I generally use to hang upon the string AB (Plate LXIV. fig. 15,) the hook of a chain C, the other extremity of which falls on the ground. Sometimes I use another caution besides, which is to stand upon an insulated stool; in which situation, I think, that if any quantity of electricity, suddenly discharged by the clouds, strikes the kite, it cannot much affect any person. As to insulated reels, and other such like instruments, that some gentlemen have used to raise the kite without any danger of receiving a shock; fit for the purpose as they may appear in theory, they are yet very inconvenient to be managed. Except the kite be raised in the time of a thunder storm, there is no great danger for the operator to receive any shock. Although I have raised my electrical kite hundreds of times, without any caution whatever, I have very seldom received a few exceedingly slight shocks in my arms. In time of a thunder storm, if the kite has not been raised before, I would not advise a person to raise while the stormy clouds are just over head; the danger at such a time being very great, even with the precautions above mentioned: at that time the electricity of the clouds may be observed, without raising the kite, by a cork-ball electrometer held in the hand in a open place, or, if it rain, by the electrometer for rain, to be described hereafter. When the kite has been raised, I generally introduce the string through a window in a room of the house, and fasten it to a strong silk lace, the extremity of which is generally tied to a heavy chair in the room. In Plate LXIV. fig. 16, AB represents part of the string of the kite, which comes within the room; C re-

presents the silk lace; DE, a small prime conductor, which, by means of a small wire, is connected with the string of the kite; and F represents the quadrant electrometer, fixed upon a stand of glass covered with sealing-wax, which I used to put near the prime conductor, rather than to fix it in a hole upon the conductor, because the string, AB, sometimes shakes so as to pull the prime conductor down: in which case the quadrant electrometer remains safe upon the table, otherwise it would be broken, as I have often experienced before I thought of this method. G represents a glass tube, about eighteen inches long, with a knobbed wire cemented to its extremity, with which instrument I use to observe the quality of the electricity, when the electricity of the kite is so strong, that I think it not safe to come very near the string. The method is as follows:—I hold the instrument by that extremity of the glass tube which is farthest from the wire, and touch the string of the kite with the knob of its wire, which being insulated acquires a small quantity of electricity from it; which is sufficient to ascertain its quality, when the knob of the instrument is brought near an electrified electrometer." Mr. Cavallo, however, with all his caution, could not always avoid danger, even when there was no thunder; as appears from the circumstances he informs us attended some of his experiments. And other electricians have in experiments with the kite sometimes been surprised by very singular phenomena, attended with evident danger, hence the greatest circumspection is required. The general laws deduced by Mr. Cavallo, from his experiments with the kites, are as follow:

"I. The air appears to be electrified at all times; its electricity is constantly positive, and much stronger in frosty than in warm weather; but it is by no means less in the night than in the day time.

"II. The presence of the clouds generally lessens the electricity of the kite; sometimes it has no effect upon it: and it is very seldom that it increases it a little." To this the above-mentioned instance is a most remarkable exception.

"III. When it rains, the electricity of the kite is generally negative, and very seldom positive.

"IV. The aurora borealis seems not to affect the electricity of the kite.

"V. The electric spark taken from the string of the kite, or from any insulated conductor connected with it, especially when it does not rain, is very seldom longer than a quarter of an inch; but it is exceedingly pungent. When the index of the electrometer is not higher than 20° , the person that takes the spark will feel the effect of it in his legs; it appearing more like the discharge of an electric jar than the spark taken from the prime conductor of an electrical machine.

"VI. The electricity of the kite is generally stronger or weaker, according as the string is longer or shorter; but it does not keep any exact proportion to it. The electricity, for instance, brought down by a string of a hundred yards, may raise the index of the electrometer to twenty, when, with double that length of string, the index of the electrometer will not go higher than twenty-five.

"VII. When the weather is damp, and the electricity is pretty strong, the index of the electrometer, after taking a spark from the string, or presenting the knob of a coated phial to it, rises surprisingly quick to its usual place; but in dry and warm weather it rises exceedingly slow."

The principal use of the electrical kite is to shew the electricity of the atmosphere; and it is perhaps the only instrument that will do this at all times with certainty, though several others have been invented for that purpose, as will be noticed in the next section. But another use to which electrical kites have been applied, is to bring down quantities of the electric fluid from the upper regions of the atmosphere, for the purpose of supplying that deficiency of electricity, which is supposed to be hurtful to vegetation. The Abbé Bertholon advises for this purpose to erect conductors, or launch paper kites on mountains, in order to seek out and direct this fluid towards the surface of the earth. "These (he adds) will immediately and at all times obtain an electricity so much the more strong as the height of the atmosphere shall be the more considerable." With this view he even proposes to double the kites. "Upon a high mountain (says he) there were launched two electric paper kites, one of which was fixed to the inferior extremity of the other, thus gaining a double advantage in point of height;

the consequence of which was, that the electric effects were incomparably greater than those produced by a single instrument."

Several instruments have been invented for ascertaining the state of the atmosphere with respect to the quantity of electricity it may contain, at any given time. The best of them are improvements upon Canton's electrometer, which is made by inclosing the pith-balls, or rather two slips of gold leaf, in a cylindrical glass vessel, to prevent their being affected by the wind. Bennet's electrometer, Plate LXIV. fig. 18, is a very delicate instrument, and capable of distinguishing small quantities of electricity. It consists of two slips of leaf gold A, suspended in a glass B. The foot C may be of wood or metal; the cup D of metal. The cup is made flat on the top, that plates, books, evaporating water, or other things to be electrified, may be conveniently placed upon it. The cup is about an inch wider in diameter than the glass, and its rim about three quarters of an inch broad; which hangs parallel to the glass, to turn off the rain, and keep it sufficiently insulated. Within this is another circular rim, about half as broad as the other, which is lined with silk or velvet, and fits close upon the outside of the glass; thus the cap fits well, and may be easily taken off to repair any accident happening to the leaf gold. Within this rim is a tin tube, hanging from the centre of the cap, somewhat longer than the depth of the inner rim. In the tube a small peg is placed, and may be occasionally taken out. To the peg, which is made round at one end, and flat at the other, the slips of leaf gold are fastened with paste, gum-water, or varnish. These slips suspended by the peg, and that in the tube fast to the centre of the cap, hang in the middle of the glass, about three inches long, and a quarter of an inch broad. On one side of the cap there is a small hole to place wires in. It is evident, that without the glass, the leaf gold would be so agitated by the least motion of the air, that it would be useless: and if the electricity should be communicated to the surface of the glass, it would interfere with the repulsion of the leaf gold; therefore two long pieces, H H, of tin-foil are fastened with varnish on opposite sides of the internal surface of the glass, where the leaf gold may be expected to strike, and in connection with the foot. The upper end of the glass is covered and lined with sealing-wax as low as the outermost rim, to make its insulation more perfect. The sensibility of this instrument is so great as even to astonish the most experienced electricians who have been witnesses of its effects. The brush of a feather, the throwing of chalk, hair-powder, or dust, against its cap, evince strong signs of electricity. The electricity of vapour is elegantly shewn by pouring a tea-spoonful of water on an ignited coal placed in a metallic cup upon the cap of this electrometer; and a very great and pleasing variety of other experiments may be made with this excellent instrument. In performing several atmospheric-electrical experiments about the year 1776, I found," says Mr. Cavallo, "that the use of Canton's cork-ball electrometer was much obstructed by the wind, in consequence of which I attempted to inclose it in a bottle, and after a variety of trials and alterations, the instrument was, in the year 1777, brought to the state which is represented in fig. 19. The three parts of the figure represent the instrument in its case, the same out of the case, and a section of its brass cap and neck. CDMN is an open glass vessel narrower at top than at bottom, and cemented into the wooden piece A B, by which part the instrument is held when it is to be presented to the atmosphere, or it may be rested upon a table for other experiments. This wooden piece also serves to screw the instrument into its wooden case O. The upper part of CDMN is tapering like the neck of a phial; and a short glass tube is cemented into it, so as to project a little above, and a little within the neck of the former: then the upper part of the instrument from C D to L, is covered with sealing-wax, by means of heat, which gives it the appearance of one continue body. The inner part G of the small glass tube is also covered with sealing-wax. Into this tube a brass wire is cemented, the lower part H of which is flattened, and is perforated with two holes; the upper part L is formed into a screw, upon which the brass cap E F is screwed. The office of this cap is to defend the upper part of the instrument from the rain. The conical, or oval, or globular, corks P of this electrometer, are as small as can be made, and are suspended by exceedingly fine silver wires, the upper parts of which are formed in rings, which pass through the holes at H, and are thereby so loosely suspended, that they are caused to diverge

when the brass cap E is exposed to a very slightly electrified atmosphere. I M and K N are two narrow slips of tin-foil stuck to the inside of the glass, and communicating with the wooden bottom A B; they serve to carry off that electricity, which, when the corks touch the glass, is communicated to it, and if accumulated would disturb the free motion of the corks." Mr. Cavallo's electrometer for rain is represented in fig. 17. Of this he gives the following description: "In principle it is nothing more than an insulated instrument to catch the rain, and by a pith ball electrometer, to shew the quantity and quality of its electricity. A B C I is a strong glass tube about 2½ feet long, having a tin funnel D E cemented to its extremity, which funnel defends part of the tube from the rain. The outside surface of the tube from A to B is covered with sealing-wax; so also is the part of it which is covered by the funnel. F D is a piece of cane, round which brass wires are twisted in different directions, so as to catch the rain easily, and at the same time to make no resistance to the wind. This piece of cane is fixed into the tube; and a slender wire proceeding from it goes through the bore of the tube, and communicates with the strong wire A G, which is thrust into a piece of cork fastened to the end, A, of the tube. The end, G, of the wire A G, is formed in a ring, from which I suspend a more or less sensible pith ball electrometer as occasion requires. This instrument is fastened to the side of the window-frame, where it is supported by strong brass hooks at C B; which part of the tube is covered with a silk lace, in order to adapt it better to the hooks. The part F C is out of the window, with the end F elevated a little above the horizon. The remaining part of the instrument comes through a hole in one of the lights of the sash within the room, and no more of it touches the side of the window than the part C B. When it rains, especially in passing showers, this instrument, standing in the situation above described, is frequently electrified; and, by the diverging of the electrometer, the quantity and quality of the electricity of the rain may be observed without any danger of mistake. With this instrument I have observed, that the rain is generally, though not always, electrified negatively; and sometimes so strongly, that I have been able to charge a small coated phial at the wire A G. This instrument should be fixed in such a manner that it may be easily taken off from the window, and replaced again as occasion requires; for it will be necessary to clean it very often, particularly when a shower of rain is approaching." One of the best electrometers, if not the very best hitherto invented, for measuring artificial electricity, is that of Mr. A. Brook of Norwich. It is acknowledged by electricians to be constructed on the only true principle on which machines for measuring the quantity of electricity can be made. The mere attraction of any light body shews indeed that the substance which attracts it is electrified; but this property is by no means calculated to discover the comparative strength of it, on account of its continual variation. Thus, if we hold any body within the electrified atmosphere of another, though it be first attracted pretty strongly, yet that attraction will be constantly diminishing, and at last changed into a repulsive power; but the latter, after it has once taken place, continues invariable as long as any degree of electric charge remains. Fig. 20, and 21, Plate LXIV. represent an electrometer, or rather two, nearly similar to Mr. Brook's. These two instruments are used either conjoined or separately. The arms F M f k; fig. 21, when used, are placed as much as possible out of the atmosphere of a jar, battery, prime conductor, &c. The arm F M, and the ball K, are made of copper, and as light as possible. The divisions on the arm F M are each exactly a grain. They are ascertained at first by placing grain weights on a brass ball which is within the ball L; (this ball is an exact counterbalance to the arm F M, and the ball K, when the small slide on this arm is at the first division,) and then removing the slide till it, together with the ball K, counterbalances the ball L, and the weight laid on it. A, fig. 20, is a dial-plate, divided into 90 equal parts. The index of this plate is carried once round, when the arm B C has moved through 90°, or a quarter of a circle. That motion is given to the index by the repulsive power of the charge acting between the ball D and the ball B. (Phil. Trans. vol. lxxxii. p. 384.) The arm B C being repelled, shews when the charge is increasing, and the arm F M shews what this repulsive power is, between two balls of this size, in grains, according to the number the weight rests at, when lifted up by the repulsive power of the charge:

charge: at the same time the arm BC points out the number of degrees to which the ball B is repelled; so that, by repeated trials, the number of degrees answering to a given number of grains, may be ascertained, and a table formed from these experiments, by which the electrometer, fig. 20, may be used without that of fig. 21.

MEDICAL ELECTRICITY.

OF THE ORIGIN, IMPROVEMENT, AND ADVANTAGES, OF MEDICAL ELECTRICITY.

The application of the electric fluid to medical purposes took its rise not long after the discovery of the electrical machine. The first idea of its probable utility, in this respect, appears to have arisen from observing the effects produced by it, upon those who, from curiosity, submitted to be electrified; although the fear natural to persons, who first venture to make such experiments, doubtless led them to magnify these effects, and to ascribe to electricity all those consequences which probably arose from their own apprehensions; such as increase of pulsation, heat, perspiration, &c. Mr. Cavallo says, that "the number of patients electrified at that time is prodigious, and the pretended cures effected by it were wonderful indeed. Accounts of those miracles performed by electricity were published in various parts of Europe, together with the method of electrifying the patients; to which were added such theories as, allowance being made for the infancy of electricity at that time, would seem impossible ever to have been proposed to the public. These theories were usually enforced by the account of experiments which often proved false upon examination. But at present a much better acquaintance with the science of electricity than philosophers had about 30 or 40 years ago, and less faith in the accounts of the generality of those persons, whose interest it is to promote the use of electricity in medicine, has pointed out the effects of that power upon the human body, in various circumstances, and has shewn how far we may confide in it; establishing upon indisputable facts, that the power of electricity is neither that admirable panacea it was considered by some fanatical and interested persons, nor so useless an application as others have asserted; but that when properly managed, it is a harmless remedy, which sometimes instantaneously removes divers complaints, generally relieves, and often perfectly cures, various disorders, some of which could not be removed by the utmost endeavours of physicians and surgeons. When the first rumour occasioned in Europe by the accounts of many pretended, and of a few real wonders, performed by electricity, had in some measure subsided, many creditable and experienced physicians, who justly considering it as their duty, had undertaken to examine the power of this new remedy, published some unsuccessful applications of electricity in divers diseases; in which cases they had not only prescribed the electrization, but the operation had been performed either by themselves or under their inspection. These publications gave a new turn to the reputation of medical electricity; and since that time the generality of physicians and surgeons had not the least regard for its medical application; so that the practitioners of it were rather considered as fanatics and impostors. However, an attentive examination of this subject, after several trials, and after overcoming in a great measure the rooted prejudice among physicians, began to establish anew the reputation of medical electricity; and shewed that many applications of electricity, published in the above-mentioned accounts, had proved unsuccessful, because the operation was not managed properly: so that it had been the abuse, and not the use, of electricity, that had proved unsuccessful, and in some cases even detrimental; for at that time, strong shocks and strong sparks were generally administered, which a long series of experiments and observations has proved to be generally useless or hurtful. Mr. Lovet, who practised medical electricity for a long time was, as far as I know, the first who protested against the use of strong shocks; and in an essay of his intitled "Subtil Medium proved," asserts, the shocks to be used in medical electricity should be very small; by which treatment he hardly ever failed of curing or at least relieving, his patients. One thing, however, appears to be a little remarkable in favour of electricity, as a medicine, that though it has often fallen into the hands of very unskilful and injudicious persons, who have applied it at random in all cases, without being capable of distinguishing

either the nature of the disorder, or the degree in which it ought to be administered yet it has seldom been known to be attended with any bad effects; the patient has generally been relieved, and very frequently cured, but the ill consequences have been even more rare than those of inoculation. Electricity differs from other medical applications in this, that it requires not so much a thorough knowledge of the distemper, as a peculiar nicety in conducting the operation. For, however paradoxical this may appear, it is certain that the electric shock is by no means prejudicial to persons in health, and therefore to electrify a sound part of the body along with a diseased one, can do no harm. The degree of electrization must be regulated rather by the patient's feelings, than by the species of disease, and therefore nosology is not an indispensably necessary branch of science to the medical electrician. There can be no doubt, however, that medical electricity will have every chance of being best applied, as well as improved by skilful physicians or surgeons, whose knowledge of anatomy, as well as of nosology, will enable them to direct the electrical fluid, to the most proper part of the body, and to pass it through the most minute vessels, according to the nature of the disease and the part of the body affected. And it is to be hoped, that in such skilful hands, this useful branch of the science may be brought to perfection, by the discovery of easier and more certain methods of applying the electric fluid with the best effects, in different diseases. "The superiority of electricity," says Mr. Cavallo, "over other remedies, in many cases, may appear from considering, that medicines in general cannot always be confined to a particular part of the body, and to let them pass through other parts is often dangerous, for which reason they cannot be used; besides that after those medicines have exerted their required power, they are with great difficulty, if at all, separated from the body. But it is of no consequence, whether the power of electricity passes through this or that other part of the body, in order to come at the seat of the disease; and after having exerted its action, it is instantly dispersed. Hence it appears why electricity has often cured such obstinate disorders as have not yielded to any other treatment."

OF THE APPARATUS NECESSARY FOR THE MEDICAL APPLICATION OF ELECTRICITY.

The apparatus for medical electricity, besides the electrical machine, consists of the following articles: 1. An insulating stool with glass feet, or, what is much better, an arm chair, well rounded at the edges of the wooden parts, and fixed on a large stool with glass feet, which should be at least nine or ten inches in length; for the longer the feet are, the better will the insulation be. The inside part of the back of the chair should move on an hinge, that it may be occasionally let down to the stool, and the back of the patient be thus electrified more conveniently; the arms of the chair should be made longer than ordinary. 2. A Leyden bottle with a discharging electrometer. 3. A pair of directors of considerable size, with glass handles and wooden points. 4. A large metallic ball of brass or copper, with a metallic handle to receive the sparks. The ball should be unscrewed, and the wire long and sharp-pointed to receive the stream of electric fire. 5. A few glass tubes of different bores, some of them with capillary points. 6. Several yards of brass wire or chain; or, which is much better, several lengths of wires with loops at the end: the part of the wire between these being covered with some non-conducting substance, as a silk ribbon, &c. The directors are represented on Plate LXIV. fig. 24, the handles being of glass, one of them having a ball on its end represented by A; the other is without the ball, having its wire bent for the convenience of conducting the electric stream on the eye, &c. Either of the balls may be unscrewed from the wires, and the wooden point B screwed in its place, or the pointed end of the brass wire used. The glass handles should be held as far from the brass work as possible. To convey the electric fluid to the ear or throat, glass tubes with sliding brass wires through them should be made use of, such as are represented in fig. 25, and 26. Fig. 27 represents the electric forceps, which is thought by some electricians to be more convenient for giving the shock than the directors. Fig. 9, plate LXIII. is the medical jar, with an electrometer, above described, that regulates the strength of the shock, and enables the operator to give a succession of them of nearly equal force. In using this medical jar, the ball B must be placed in contact with the conductor of the electrical machine,

or at least be connected with it by a wire; after which it is to be charged in the usual manner. If wires proceed from LL, to the outside coating, the jar will be immediately discharged, as the accumulation of the electric fluid is sufficiently powerful to pass through the space of air between the two balls: hence a shock may be communicated to the arm by means of the wires and directors as in the figure, and it will be stronger in proportion as the distance of the ball C from B is augmented. This electrometer acts in the manner of the common discharging rod, and therefore has received the name of the discharging electrometer.

In fig. 28, Plate LXIV. *g* represents the BOTTLE-DIRECTOR. It is hollow, and coated like a common jar, acting as such, and in some cases is looked upon as very convenient. With this, as with the common director, it is proper to press the ends against the part where the shock is to be applied. The instrument represented in fig. 30, has been used successfully in the cure of the tooth-ach. *A* is a strong piece of box-wood in which the wires *a b* and *e f* are fixed and then bent, the tooth and gum are placed between *c* and *f*, and the circuit between the outside and inside of the jar is to be made by means of the chains *g* and *h*.

A small pocket electrical apparatus is represented on Plate LXIV. fig. 29, which may sometimes be of use for other purposes as well as medical. It is packed up in a very small size, being only five inches long, two broad, and one deep. It is capable of a tolerably strong charge of electricity, and will give a small shock to one, two, three, or a great number of persons. *A* is the Leyden phial that holds the charge; *B* is the discharger to discharge the jar when required without electrifying the person that holds it; *C* is a silk ribbon prepared by a coating of varnish, so as to be excited, and communicate its electricity to the jar; *D* are two hare skin rubbers, which are to be placed on the first and middle fingers of the left hand, and serve to excite the ribbon *C*.

In order to CHARGE the JAR, place the two finger-caps, *D*, on the first and middle finger of the left hand; hold the jar, *A*, at the same time at the joining of the red and black, *E*, on the outside between the thumb and first finger of the same hand; then take the ribbon in the right hand, and steadily and gently draw it upwards between the two rubbers *D*, on the two fingers, taking care at the same time the brass ball of the jar is kept nearly close to the ribbon while it is passing through the fingers. By repeating this operation 12 or 14 times the electrical fire will pass into the jar, which will become charged; and by placing the discharger, *C*, against it, as in the plate, a sensible spark will be seen to pass from the ball of the jar to that of the discharger. If the apparatus is dry and in good order, the crackling of the fire will be heard when the ribbon is passing through the fingers, and the jar will discharge at some distance.

OF THE DIFFERENT METHODS OF APPLYING THE ELECTRICAL FLUID TO THE HUMAN BODY.

It appears somewhat remarkable, that, when a small power of medical electricity is to be used, large machines should be recommended; whereas not long ago when strong shocks were administered, small machines were used. The reason is, that when shocks are given, a very small electrical machine can charge a Leyden phial much stronger than is necessary; whereas, when the stream is used, which is now found to be most efficacious in the cure of diseases, then the small machines are mostly useless. In general the power of the machine should be so regulated, as to apply every degree of it with ease and readiness; beginning with the more gentle operations, by a stream issuing from a metal point; next using a wooden point; then small sparks, stronger sparks, and lastly small shocks, in proportion to the strength and constitution of the patient, and the nature of the disease. The common method of electrifying a person is well known. Desire the patient to take the jar in one hand, and with the other touch the knob of it: or, if diversion is intended to accompany the medical effect, desire him to smell at the knob, *A*, in expectation of smelling the scent of a rose or a pink. This last method has occasioned it to be sometimes called the magic smelling bottle. But the principal methods by which electricity may be applied to the human body with a medical intention, are the following:

I. By placing the patient in an insulated chair, and connecting him with the prime conductor. When the machine is in action, he will thus be filled with the electric fluid, which will be continually dis-

sipated from the points and edges of his clothes: and though the effects of this are probably too slow to be rendered very advantageous, yet a sedentary person may derive some benefit from sitting in an insulated chair, having before him an insulated table, the chair to be connected with the ball of a large charged jar or battery; by which means a small quantity of the fluid will be continually passing through those innumerable capillary vessels, on the right state of which our health very much depends.

II. By throwing the fluid upon, or extracting it from, a patient, by means of a wooden point. This may be effected in a twofold manner: 1st, By insulating the patient, and connecting him either with the cushion or the positive prime conductor, the operator presenting the point. 2d, Let the patient stand upon the ground, and the wire of the director be connected either with the positive or negative parts of the machine. The sensation produced by the fluid when acting in this manner is mild and pleasing, resembling the soft breezes of a gentle wind; generating a genial warmth, and promoting the secretion and dissipation of tumours, inflammations, &c.

III. By the electric friction. Cover the part to be rubbed with woollen cloth or flannel. The patient may be seated in an insulated chair, and rubbed with the ball of a director that is in contact with the conductor; or he may be connected with the conductor, and rubbed with a brass ball which communicates with the ground. The friction thus produced is evidently more penetrating, more active, and more powerful, than that which is communicated by the flesh brush; and there is very little fear of being thought too sanguine. This, when used but for a few minutes, will be found more efficacious than the other after several hours application. Electricity applies here with peculiar propriety to spasm, pleurisy, and some stages of the palsy; and in every case answers the end of blistering, where the discharge is not wanted, being the most safe and powerful stimulant we know.

IV. By taking strong sparks from the patient. Here, as in every other case, the operator may connect the ball of the director with the positive or negative conductor, or he may connect the patient with either of these and the ball with the ground. Now it is clear from what has been already observed, that if the director be connected with the positive conductor, the fluid is thrown upon the patient; if with the cushion the fluid is extracted from him. Let the patient be insulated, and the action is in some measure reversed; if he is joined to the negative conductor or cushion, he will receive a spark from a person standing on the floor; but if he communicates with the positive conductor, he will give the spark to the person on the ground.

V. By causing a current of the electric fluid to pass from one part of the body, and thus confining and concentrating its operation without communicating the shock. Place the patient in an insulated chair, and touch one part of the body with a director, joined to a positive conductor; then with a brass ball communicating with the ground touch another part; and when the machine is in action the fluid will pass through the required part from the conductor to the ball; the force of the stream will be different according to the strength of the machine, &c. Or connect one director with the cushion, and the other with the positive conductor, and apply these to the part through which the fluid is to pass, and when the machine is in action the electricity will pass from one ball to the other. It is not necessary to insulate the patient in this case.

VI. By the electrical shock. The shock may be given to any part of the human body, by introducing that part of the body into the circuit which is made between the outside and inside of the bottle. This is conveniently effected, by connecting one director by a piece of wire with the electrometer, and the other with the outside of the bottle; then hold the directors by their glass handles, and apply the balls of them to the extremity of the parts through which the shocks are to be passed. The force of the shock is augmented or diminished by increasing or lessening the distance between the two balls, which must be regulated by the operator to the strength and sensibility of the patient. Instead of the common bottle, we may have a small one with a glass tube proceeding from it, through which proceeds a wire and hook to hang it upon the machine, with a longer one from the outside coating, and which is to be carried by means of a director to the patient. When this is used as a common bottle, both wires are to

be left there, and the shock is communicated by two directors, one connected with the bottom, the other with the top. The operator will often find himself embarrassed in giving small shocks, the fluid passing from the conductor to the ball of the electrometer, instead of going through the circuits he desires: when this happens, which may be known by the chattering noise of the sparks, the resistance formed to the discharge is so great, that the fluid cannot force its way through the circuit: to remedy this, pass two metallic pins through the cloathing, so that they may be in contact with the skin, which will lessen the resistance, and conduct the fluid.

VII. By a sensation between a shock and the spark, which does not communicate that disagreeable feeling attending the common shock. This is effected by taking out the long wire from the small medical bottle, and leaving the shorter one which is connected with the tube in its place, the directors to be connected and used as before. The effect of this species of shock, if it may be called one, is to produce a great vibration in the muscular fibres, without inducing that pungent sensation which the shock effects. It is therefore applicable to some stages of palsy and rheumatism; it may also serve as an artificial means of exercise.

VIII. By the bottle director. Insulate the patient, and place the ball *g*, (Plate LXIV. fig. 28,) in contact with him; by which means this director is charged. If a wire is conveyed from the bottom of this to the top of another director, the bottle director will be discharged whenever the other ball *h* is brought in contact with the patient; so that by bringing it down with rapidity, any number of small shocks may be procured in a minute; or connect the insulated patient with the top or inside of a large charged jar, and then this apparatus used in the foregoing manner will discharge from the large jar at each spark its own contents, and by repetition it will discharge the whole jar: thus a number of shocks may be given without continually turning the machine or employing an assistant.

IX. By passing the whole fluid contained in the Leyden phial through a diseased part without giving the shock. Connect a director, by means of a wire, with the ball of a Leyden jar; charge the jar either completely or partially, and then apply the ball or point of the conductor to the part intended to be electrified, and the fluid which was condensed in the phial will be thrown on the part in a dense slow stream, attended with a pungent sensation which produces a considerable degree of warmth. If a wire that communicates with the ground is placed opposite to the end of the director, the passage of the fluid will be rendered more rapid, and the sensation stronger. Or insulate the patient, connect him with the top of a jar, charge this, and then apply a metal wire or piece of wood to the part through which you wish to make the fluid pass. It is obvious, that in this case the circuit between the inside and the outside of the jar is not completed, therefore the shock will not be felt. The condensed fluid passes in a dense slow stream through the required part, while the outside acquires a sufficient quantity from substances near it to restore the equilibrium.

GENERAL RULES FOR THE ADMINISTRATION OF MEDICAL ELECTRICITY.

It is impossible to prescribe the exact degree of electrization requisite for various diseases. Persons of different constitutions, though afflicted with the same disease, often require different degrees of electrification. The following general rules for practice are laid down by that learned electrician Mr. Cavallo:

"I. It should be attentively observed, to employ the smallest force of electricity that is sufficient to remove or alleviate any disorder. Thus the shocks should never be used, when the cure may be effected by sparks; the sparks should be avoided, when the required effect can be obtained by only drawing the fluid with a wooden point; and even this last treatment ought to be omitted, when the fluid drawn by a metal point may be thought sufficient. The difficulty consists in distinguishing the proper strength of electric power that is required for a given disorder, the sex and constitution of the patient being considered.—The surest rule is to begin by the most gentle treatment. When this has been found ineffectual for a few days, which is denoted by the disease not abating, and the application of electricity not causing any warmth, then the operator may gradually increase the force of electricity till he finds the proper degree of it.

"II. In judging of cases proper to be electrified, experience

shews, that in general all kinds of obstructions, whether of motion, of circulation, or of secretion, are very often removed, or alleviated by electricity. The same may also be said of nervous disorders; both which include a great variety of diseases. The application of electricity has seldom intirely cured diseases of a long standing, although it generally relieves them. To persons afflicted with the venereal disease, or to pregnant women, electrization has been thought to be pernicious; but even in those cases it may be used without fear, if judiciously managed. When pregnant women are to be electrified, the shocks should be forbidden; and even when the other more gentle treatments are used, a constant attention should be given to any phenomena that may appear in the course of the electrization; the method of which should be increased, diminished, or suspended, as circumstances may indicate.

"III. In cases of gathering tumours, the best method is to draw the fluid by means of a wooden point; or, if that prove painful, by a metal point. Sparks in these cases, and also shocks, are often hurtful. In stiffnesses, paralyties, and rheumatism, small sparks, especially through a double flannel, and also very small shocks (as most of one tenth of an inch) may be used. Stronger shocks may be sometimes, though seldom, administered for a violent tooth-ach, and for some internal spasm of no long standing.

"IV. When any limb of the body is deprived of motion, it must be observed, that the privation of motion is not always occasioned by a contraction of the muscles; but that it is often the effect of relaxation. Thus for instance, if the hand is bent inwardly, and the patient has no power of straightening it, the cause of it may be a weakness of the outward muscles, as well as a contraction of the inward ones. In such cases, as it is often difficult, even for good anatomists to discover the real cause, the surest method is to electrify not only those muscles, which are supposed to be contracted, but also their antagonists; for to electrify a sound muscle is by no means hurtful.

"V. When the stream of electric fluid is thrown either with a wooden or metal point, the length of the operation should be from three to ten minutes, more or less, according as occasion may require. When shocks are administered, their greatest number should not exceed a dozen or 14, except when they are to be given to the whole body in different directions. The number of sparks, when they are used, may generally exceed the number of shocks mentioned above.

"VI. Lastly, when children must be electrified upon the insulating chair, as it is difficult to let them remain quiet, the most convenient method is, to let another person sit in the insulating chair, and hold the child while the operator is electrifying him." On the whole, the electric fluid, issuing from a wooden point (which should not be split, or too short,) has a power intermediate between that of the stream proceeding from a metal point, and that of the spark; and is therefore in general the most proper and effectual method of electrification. It consists of a vast number of exceedingly small sparks, accompanied with a little wind, which gently stimulates the part affected, and gives a degree of warmth very agreeable to the patient. Even this gentle method of electrifying, however, is sometimes too strong when applied to open sores upon delicate parts. In such cases, therefore, the metal point must be used instead of the wooden, and the director must be kept at a greater distance, than when the wooden piece was upon it. The electric fluid issuing out of this pointed wire of the director, occasions only a very gentle wind upon the part to which it is directed, which proves agreeable even to persons of the utmost delicacy. Mr. Cavallo says, "it might naturally be suspected, that so gentle and nearly insensible a treatment could hardly be of any efficacy; but my reader may be assured, that to my certain knowledge, deduced from the practice of persons who have had long experience in this subject, this method of electrization, viz. the throwing of the fluid with a metal point, has often mitigated pains, and cured obstinate and dangerous diseases, which could not be removed by any other remedy that was tried. The stream, (he adds,) issuing both out of the wooden and of the metal points acts even through the cloaths, if they are not too thick. Hence it may be used without incommoding the patient; but when it is convenient to uncover the part which is to be electrified, it is much preferable to direct the fluid immediately upon the skin."

OF THE ADMINISTRATION OF MEDICAL ELECTRICITY IN PARTICULAR DISEASES.

Although it belongs properly to the article Medicine, to treat of the

the cure of diseases by electricity, as well as by other means, yet there would be a manifest defect in this branch of our subject, were we not to mention the particular method of applying the electric fluid in several of the most common diseases, in which medical electricity has been found efficacious.

"**RHEUMATIC** disorders even of long standing, "says Mr. Cavallo, "are relieved, and generally quite cured by only drawing the electric fluid with a wooden point from the part, or by drawing sparks through flannel. The operation should be continued for four or five minutes, repeating it once or twice every day.

"**DEAFNESS**, except when occasioned by obliteration, or other improper configuration of the parts, is either intirely or partly cured by drawing the sparks from the ear with the glass tube director, or by drawing the fluid with a wooden point. Sometimes it is not improper to send exceedingly small shocks from one ear to the other. Whenever the ear is electrified, the discharge of the wax is considerably promoted.

"The **TOOTH-ACH**, occasioned by cold rheumatism, or inflammation, is generally relieved by drawing the electric fluid with a point, immediately from the part, and also externally from the face. But when the body of the tooth is affected, electrization is of no use.

"**SWELLINGS**, in general, which do not contain any matter, are mostly cured by drawing the electric fluid with a wooden point. In some cases of white swellings, quite cured by electricity, even the bones and cartilages were disfigured. The operation should be continued for three or four minutes every day.

"**INFLAMMATIONS** of every sort are generally relieved by a very gentle electrization.

"In **INFLAMMATIONS OF THE EYES**, the throwing of the electric fluid by a wooden point is constantly attended with great benefit; the pain being quickly abated and the inflammation generally dissipated in a few days. In these cases, the eye of the patient must be kept open, and care taken not to bring the point very near it. Sometimes it is sufficient to throw the fluid with a metal point; for in these cases too great an irritation should be avoided. After throwing the fluid for about half a minute, a short time may be allowed to the patient to rest, and to wipe his tears: then the operation may be continued for another half minute, and so on for four or five times every day.

"The **GUTTA SERENA** has been sometimes cured by electrization; but electricity has proved ineffectual in many such cases. The best method of administering electricity in such cases, is first to draw the fluid with a wooden point for a short time, and then to send about half a dozen shocks of one-20th of an inch, from the back and lower part of the head to the forehead, very little above the eye.

"All the cases of **FISTULA LACHRYMALIS**, as far as I am informed, that have been electrified by persons of ability for a sufficient time, have been entirely cured. The method generally practised has been that of drawing the fluid with a wooden point; and to take very small sparks from the part. The operation may be continued for about three or four minutes every day.

"**PALSIES** are seldom effectually cured by electricity, but are generally relieved to a certain degree. The method is to draw the fluid with a wooden point, and to draw sparks through flannel, or through the usual coverings, if not too thick, for about five minutes per day.

"**ULCERS** or open sores of every kind, even of long standing, are generally disposed to heal by electrization. The general effects are a diminution of the inflammation; and a discharge of matter, which gradually lessens till the sore is quite cured. The gentlest electrization must be used. To draw or throw the fluid with a wooden or metal point, for three or four minutes per day, is quite sufficient.

"**CUTANEOUS ERUPTIONS** have been successfully treated with electrization, but if the wooden point is kept too near the skin, so as to cause any considerable irritation, the eruption will sometimes spread more: but if kept at about six inches distance, the eruptions will be gradually diminished till they are quite cured. A warmth about the electrified part is a sign that the electrization is rightly administered.

"The application of electricity has perfectly cured various cases of **St. Vitus's Dance**, or of that disease commonly called

so. Shocks of about one-10th of an inch may be sent through the body in various directions, and sparks may be taken.

"**SCROFULOUS TUMOURS**, when just beginning, are generally cured by drawing the electric fluid with a wooden or metal point from the part.

"In **CANCERS**, the pains only are mostly alleviated by drawing the electric fluid with a wooden or metal point. I know of one case only, in which a most confirmed cancer of very long standing, on the breast of a lady, has been much reduced in size. This patient was so far relieved by drawing the fluid with a metal point from the part, that the excruciating pains she had suffered for many years, did almost entirely disappear. When the electric fluid was drawn by a wooden point, the pains rather increased. This person, when I heard of her last, was still under the electricity, and the cancer seemed not unlikely to be perfectly cured, contrary to the expectations even of the judicious physician who electrified her.

"**ABSCESSSES**, when beginning, and when there is any tendency to form matter, electrization dispersed. Lately, in a case in which matter was formed upon the hip, called the lumbar abscess, the disease was perfectly cured by electricity. The sciatica has also been often cured by it. In all such cases the electric fluid must be sent through the part, by means of two directors applied to opposite parts, and in immediate contact either with the skin, or with the coverings, when very thin.

"In cases of **PULMONARY INFLAMMATIONS**, when beginning, electrization has sometimes been beneficial; but in confirmed diseases of the lungs, I do not know that it ever afforded any unquestionable benefit.

"**NERVOUS HEAD-ACHS**, even of long standing, are generally cured by electrization. The electric fluid must be thrown with a wooden and sometimes even with a metal point, all round the head successively. Shocks can seldom be used, because the nerves of persons subject to this disease are so very irritable, that the shocks, the sparks, &c. throw them into convulsions.

"The application of electricity has often been found beneficial in the **DROPSY** when just beginning, but it has never been of any use in advanced dropsies. The electric fluid is sent through the part in various directions; and sparks are drawn across the flannel, or cloaths, for at least ten minutes. Perhaps a simple electrization, (viz. to insulate the patient, and connect him with the prime conductor, while the machine is in action,) continued for an hour or two, would be more beneficial.

"The **GOUT** has been cured by electricity in various instances. The pain has been generally mitigated, and sometimes the disease has been removed so effectually as not to return. In those cases the electric fluid has been thrown by a wooden point, though sometimes, when the pain was too great, a metal point only was used.

"**AGUES** very seldom fail of being cured by electricity, so that sometimes one electrization or two have been sufficient. The most effectual method is drawing sparks through flannel or the cloaths for about ten minutes, either at the time of the fit, or a short while before it is expected.

"The **SUPPRESSION OF THE ORDINARY PERIODICAL FLUXES** of women has often been cured by electricity, even when the disease has been of long standing, and after the most powerful medicines have proved ineffectual. Small shocks of one-20th of an inch may be sent through the pelvis; sparks may be taken through the cloaths from the parts adjacent to the seat of the disease; and the electric fluid may be transmitted by applying the metallic or wooden extremities of two directors to the hips, in contact with the cloaths. The number of shocks may be about 12 or 14. The other applications may be continued for two to three minutes, repeating the operation every day. But strong shocks should be avoided."

We shall conclude this account of medical electricity with observing that there are two general effects of electricity on the human body, of which it should seem, that physicians might greatly avail themselves. These are, that it promotes insensible perspiration and glandular secretion. The former is effected by simple electrification, and the latter by taking sparks from the glands or parts contiguous to them on which it acts like a stimulus.

ELECTRICS,

ELECTRICS, substances which by rubbing exhibit electrical appearances, or the presence of the electrical fluid. See **ELECTRICITY**.

ELECTRIDES, in ancient geography, islands in the Adriatic sea, so named from the quantity of amber which they produced. They were at the mouth of the Po, according to Apollonius of Rhodes, but some historians doubt their existence.

ELECTRIFICATION, or **ELECTRIZATION**, the state of being electrified.

ELECTRIFY, to communicate to a body the powers of attraction and repulsion, or any other electrical property. To electrify a person, signifies to give one a flash, spark, or shock, of electricity.

ELECTROMETER, and **ELECTROPHORUS**, instruments used in electrical experiments. See **ELECTRICITY**.

ELECTUARY, a form of medicine made of conserves and powders, in the consistence of honey. Vossius observes, that all the remedies prescribed for the sick, as well as the confections taken by way of regale, were called by the Greeks *ἐλεκτάρια*, and *ἐλεκτα*, of the verb *ἐλεγχω*, I lick; whence, says he, was formed the Latin *electarium*, and afterwards *electuarium*. This conjecture he supports from the laws of Sicily. See **PHARMACY**.

ELEEMOSYNA ARATRI, **ELEEMOSYNA CARUCARUM**, or **PRO ARATRIS**, in our ancient customs, a penny which king Ethelred ordered to be paid for every plough in England towards the support of the poor. It is also called *elemosyna regis*, because first appointed by the king.

ELEEMOSYNARIUS, in old records, the almoner, or officer who received the eleemosynary rents and gifts, and distributed them to charitable uses.

ELEGANCE, in oratory and composition, an ornament of politeness and agreeableness, with such a choice of rich and happy expressions, as to rise above the common manners, so as to strike people of a delicate taste. It has been observed, that elegance, though irregular, is preferable to regularity without elegance; and that, by being too scrupulous about grammatical construction, we lose certain licences wherein the elegance of language consists. But, on the other hand, it is to be feared, that an affectation of such elegance is in danger of corrupting a language, by introducing ambiguity of expression and other improprieties.

ELEGIAC, in ancient poetry, any thing belonging to elegy. Elegiac verses are alternately hexameter and pentameter, as in the following verses of Ovid.

Flexilis indignos, elegeia, solve capillos;
Ah nimis ex vero nunc tibi nomen erit.
Sometimes, though very rarely, the pentameter preceded the hexameter, as in the following verses of Athenæus.

Ποδαίρων Χερσίν, καὶ Μελανίππῳ, φρεσὶ καὶ νομῇ, καὶ
Θυγῶν ἀνίστηναι ἀφ' ἑμῶν ψυχῶν.

Who was the inventor of elegiac poetry, is not known. Horace professes himself quite ignorant of it. The principal writers of elegiac verse, among the Latins, were Propertius, Ovid, and Tibullus, the latter whereof Quintilian esteems the best elegiac poet; but Pliny the younger gives the preference to the first. The chief writers of elegy among the Greeks were Callimachus, Parthenius, and Euphorion.

ELEGIA, a genus of the dioecia triandria class and order. There is one species, a native of the Cape, which has the habit of a rush.

ELEGIT, in law, a writ of execution, which lies for a person who has recovered debt or damages; or upon a recognizance in any court, against a defendant that is not able to satisfy the same in his goods.

ELEGY, a mournful and plaintive kind of poem. See **ELEGIAC**, and **POETRY**.

ELEMENTS, in astronomy, are those principles deduced from astronomical observations and calculations; and those fundamental numbers which are employed in the construction of tables of the planetary motions. Thus, the elements of the theory of the sun, or rather of the earth, are his mean motion and eccentricity, and the motion of the aphelia. The elements of the theory of the moon are its mean motion; that of its node and apogee, its eccentricity, the inclination of its orbit to the plane of the ecliptic, &c.

ELEMENTS, in physics, the first principles of which all bodies in

the system of nature are composed. These are supposed to be few in number, unchangeable, and by their combinations to produce that extensive variety of objects to be met with in the works of nature. There seems to be in reality some foundation for this doctrine; for there are some principles evidently exempted from every change or decay, but which can be mixed or changed into different forms of matter. The ancient philosophers generally reckoned four elements, viz. fire, air, water, and earth. The former chemists admitted five elements or principles, viz. 1. Spirit, or mercury. 2. Sulphur, or oil. 3. Salt. 4. Water, or phlegm. 5. Earth. That both these are wrong is well known to modern chemists, who have decomposed several of the above substances. See **CHEMISTRY**. Though we have reason to think that there are in nature a few simple substances, from the combinations of which the various bodies that surround us are composed, yet what these elements or principles are is not fully ascertained; however, considerable advances towards such a discovery, have been made by the researches of modern chemistry, and a wide field is now opened in this department, which promises plentifully to reward the labours of the experimental philosopher. Chemists have now agreed to consider those substances, which, in the present state of the science, they cannot decompose, as elements or principles, until they shall discover their component parts in case they be compound bodies. For an enumeration of these elements see **CHEMISTRY**.

ELEMI, a resin, commonly called gum elemi, is supposed to be the produce of a large tree, called in the Linnaean arrangement *amyris elemifera*, a native of Carolina, and the warmer parts of America. The true elemi is supposed to come from Ethiopia. It is used in medicine as a liniment, and is employed in the arts as an ingredient in some varnishes.

ELEPHANT, in zoology. See **ELEPHAS**.

ELEPHANT, KNIGHTS OF THE, an order of knighthood in Denmark, conferred upon none but persons of the first quality and merit. It is also called the order of St. Mary. Its institution is said to have been owing to a gentleman among the Danish croises having killed an elephant, in an expedition against the Saracens, in 1184; in memory of which, king Canute instituted this order, the badge of which is a towered elephant, with an image of the holy virgin encircled with rays, and hung on a watered sky-coloured ribbon, like the George in England.

ELEPHANTIA, a small island on the W. coast of Hindostan, 5 miles from Bombay.

ELEPHANTIASIS, the **LEPRA OF THE ARABIANS**, in medicine, a chronic disease, one of the two species of leprosy which affects the whole body, where even the bones as well as the skin are covered with spots and tumours, which being red at last turn black.

ELEPHANTINE, in Roman antiquity, an appellation given to the books wherein were registered the transactions of the senate and magistrates of Rome, of the emperors or generals of armies, and even of the provincial magistrates; the births and classes of the people, and other things relating to the census.

ELEPHANTOPHAGI, an ancient people of Ethiopia, who are said to have fed on elephants' flesh.

ELEPHANTOPUS, a genus of the polygamia segregata order, and syngenesia class of plants; natural order, Compositæ. Calyx four-flowered; corolla tubular, hermaphrodite; receptacle naked; down bristle-form. There are four species.

ELEPHAS, the **ELEPHANT**, in zoology, a genus of the class and order mammalia bruta. No fore-teeth in either jaw; tusks of the upper jaw elongated, none in the lower; proboscis very long and prehensile; body with few hairs. This animal is not to be met with in its natural state throughout Europe or America, and is to be found in its greatest perfection of size and strength between the river Senegal and the Cape of Good Hope in Africa. See Plate LXVI. There is but one species. The elephant is the largest of all land animals. From the front to the origin of the tail he is generally about 16 feet long, from the end of the trunk 25 feet, and about 14 feet high. The circumference of the neck is 17 feet, and the circumference of the body at the grossest part 25 feet 10 inches; the tail is about 6 feet long, and 2½ in circumference. The circumference of the legs is about 6 feet. These are the largest dimensions. But the animal differs in size in different countries; in some not exceeding 7 feet in height. The eyes

eyes are small in proportion to the size of the head. The muzzle is very different from that of any other quadruped: it is nothing but the origin of a long trunk which hangs between the two large tusks; the mouth appears behind the trunk, which serves in place of an upper lip, and the under lip terminates in a point. The ears are so large, that from the shoulder of a middle-sized man they will extend to the ground. In a state of tranquillity these are pendulous, but during the agitation of passion they are erected, and pointed forwards with extreme intension. The feet are short, round, clumsy, and only distinguishable by the toes. The trunk is, properly speaking, the nose extended, and terminated by a couple of nostrils. But, besides serving as an organ of smell, the trunk performs all the functions of a strong and dexterous arm. The trunk of an elephant is about 8 feet long, 5½ feet in circumference near the mouth, and one foot and a half near the extremity: it is a pipe of an irregular conical figure, and widened at the end; the superior side of the trunk is convex, and furrowed transversely; and the inferior side is flat, and has two longitudinal rows of small protuberances resembling the tentacula of the silkworm and most other caterpillars. The upper part of the trunk corresponds with the extremity of the nose in other quadrupeds, and answers the same intention; the inferior part serves as an upper lip, including the nostrils at the same time. For the trunk is a continued canal, divided into two cavities by a longitudinal partition: these cavities ascend along the fore-part of the upper jaw, where they make a turn inward, and descend into the palate, terminating in two separate orifices; they have likewise each a separate orifice at the end of the trunk. At the place where these cavities make a turn, and before they enter into the bones of the head, there is a moveable cartilaginous plate situated in such a manner as enables the animal to shut the canal, and to prevent the water, with which it occasionally fills the trunk, from entering into the passage of the nose where the organs, serving for the sensation of smell, are placed. The elephant can move the trunk in all directions; he can extend or shorten it at pleasure, without altering the diameters of the two canals within. By this means respiration is not interrupted, whatever be the situation of the trunk; and the water is allowed to remain till the animal chooses to throw it out by an expiration. It is by this organ that the animal lays hold of food or other substances; which he manages with as much dexterity as a man does his hand, taking up grains of corn, or the smallest piles of grass, and conveying them to his mouth. When he drinks, he thrusts his trunk into the water, and fills it by drawing in his breath and exhausting the air: when the trunk is thus filled with water, he can either throw it out to a great distance, or drink it by putting the end of the trunk in his mouth. The two large tusks, which some call the horns of the elephant, are of a yellowish colour, and extremely hard. The bony substance of which they are composed is known by the name of ivory, and much used in different branches of manufacture. Elephants, even in a savage state, are peaceable and gentle creatures. They never use their weapons but in defence of themselves or their companions. Their social dispositions are so strong, that they are seldom found alone, but march always in large troops: the oldest and most experienced lead the van; the young and the lame keep in the middle; and those of the middle age, walk in the rear. The females carry their young on their tusks, embracing them at the same time with their trunk. They seldom march in this regular order but when they reckon the journey dangerous, such as an expedition to cultivated lands, where they expect to meet with resistance. On other occasions they are less cautious; some of them falling behind or separating from the rest, but seldom so far as to be beyond the reach of assistance from their companions. It is dangerous to offer them the least injury; for they run straight upon the offender; and although the weight of their body be great, their steps are so large, that they easily outrun the swiftest man, whom they either pierce with their tusks, or seize with their trunk, dart him in the air, and then trample him under their feet. But they never attack any person unless when provoked. However, as they are extremely delicate with regard to injuries, it is always prudent to keep out of their way. Travellers who frequent these countries kindle large fires, and beat drums during the night, to prevent their approach. After being once attacked by men, or falling into any ambush, they never forget the injury, but search for every opportunity of revenge. As they are probably endowed with a more exquisite sensation of smell than

any other animal, owing to the great extent of their nose, they can scent a man at a very great distance, and trace him by his footsteps. Elephants are peculiarly fond of the banks of rivers, deep valleys, and marshy grounds, especially when well shaded with trees. They delight in drawing up water into their trunks, even when they do not drink it, and amuse themselves in dashing it around. They cannot endure cold, and are equally averse to heat. To avoid the scorching heat of the sun, they retire to the thickest and most shady parts of the forest. The bulk of their bodies is so enormous, that they do not choose to go into deep waters so frequently as some other quadrupeds; although the length of their trunk, which they can raise straight up to respire, is a great advantage in swimming. Their ordinary food is roots, herbs, leaves, the tender branches of trees, fruits, and grains; but they abhor flesh or fish. When any of them discovers a fine pasture, he immediately calls his companions to come and eat with him. As they devour a large quantity of food in a short time, they often shift their pasture; when they meet with cultivated grounds, they make a prodigious desolation, and destroy more plants by their feet than they use for nourishment: which last is very considerable, amounting to 150 pounds of herbage every day: by this means, as they constantly graze in large troops, they lay waste whole fields in an hour. The Indians and negroes employ every art to prevent them from visiting their cultivated lands, making great noises, and burning large fires round their fields. However, these precautions are not always sufficient to prevent the elephants from visiting them. They chase away the domestic animals, put the men to flight, and sometimes even throw down their timber huts. Elephants are hardly susceptible of fear: the only method to stop their course is by fires, squibs, and crackers, the effects of which being sudden and quickly repeated, the elephants frequently turn back; and when one runs, all the rest instantly follow him. Although the social disposition in the elephant be exceeding strong; yet whenever the females come in season, it immediately gives place to the stronger and more interesting passion of love. They observe the greatest delicacy in their amours, abhorring nothing so much as to be seen by their companions. The elephant, when tamed, is the most friendly and obedient of all animals: he is entirely attached to the person who feeds and takes care of him. In a short time he understands signs, and the sound of his master's voice. He distinguishes the language of passion, of command, of satisfaction; and acts accordingly. He receives his orders with attention, and executes them with alacrity, but without precipitation. He easily learns to bow his knees and lower his body, for the convenience of those who mount him. He caresses his friends with his trunk. He lifts burdens with his trunk, and assists those who are loading him in laying them on his back. He delights in shining harness and trappings. When yoked in a cart or waggon, he pulls equally and cheerfully, unless he be abused by injudicious chastisements. His guide is generally mounted on his neck, with a small rod of iron sharp at the point in his hand; he directs his motion by pricking him on the ears and head; but for the most part, a word is sufficient. A tame elephant will do more labour than six horses, but he requires a proportional quantity of food. They are the principal beasts of burden in many parts of Africa and the East Indies. They carry sacks and bundles of all kinds on their necks, backs, and tusks. They never lose or damage any thing committed to their care; they will stand on the edge of a river, take bundles off their necks and tusks, lay them carefully in a boat wherever they are desired, and try with their trunk whether they are properly situated; if they be loaded with casks, they go in quest of stones to prop them, and prevent them from rolling. When the elephant is properly managed, he lives very long even in a state of slavery and labour. That some have lived in this state 130 years, is pretty well authenticated. In a natural state, they often exceed 200 years, and propagate their species till they are 120. It is 30 years before they come to their full growth. The elephants inhabit India, and some of its greater islands, Ceylon, China, and some of the provinces of China. They abound in the southern parts of Africa, from the river Senegal to the Cape; and from thence as high as Ethiopia on the other side. They are found in the greatest numbers in the interior parts, where there are vast forests, near the sides of rivers. The wild elephants of Ceylon live in troops or families distinct and separate from all others, and seem to avoid the strange herds with peculiar care.

When a family removes from place to place, the largest-tusked males put themselves at the head; and if they meet with a large river, are the first to pass it. On arriving on the opposite bank, they try whether the landing-place is safe: if it be, they give a signal of a note from the trunk, as if it were the sound of a trumpet, on which the remaining part of the old elephants swim over; the little elephants follow, holding one another by locking their trunks together; and the rest of the old ones bring up the rear. In the woods is often seen a solitary male elephant, wandering like an outlaw banished from the herd and all the race. In this solitary state, as if in a state of desperation, they are very dangerous. A single man will put to flight whole herds of social elephants: the solitary one fears not his presence, but will stand firm, putting his power to defiance. Elephants are not domesticated in Africa, as in the more civilized parts of Asia, although they are much more numerous. In some parts of Africa they swarm so, that the negroes are obliged to make their habitations under ground for fear of them. They are killed and eaten by the natives, and the trunk is said to be a delicious morsel. All the teeth are brought from Africa; they are frequently picked up in the woods; so that it is uncertain whether they are shed teeth, or those of dead elephants. The African teeth which come from Mosambique are ten feet long; those of Malabar only three or four; the largest in Asia are those of Cochin China, which even exceed the size of the elephants of Mosambique. They are often so large as to weigh 150 pounds each. The skin is thick, and, when dressed, proof against a musket ball. The flesh, the gall, the skin, and the bones, are said to be used medicinally by the Chinese. Mr. Kerr says some elephants have been found so large as to weigh 4,500 pounds. They were formerly used for the purposes of war, but were frequently more formidable to their owners than to the enemy, and, when wounded, exhibited a scene of extreme turbulence and confusion: and the invention of gunpowder appears to have precluded that advantage from their efforts in actual combat, which might, in some instances, in former ages, be occasionally derived from them. Both the Greeks and Romans soon discovered the way to prevent danger from these monstrous animals, they did not attempt to hurt them, but opened their ranks, and suffered them to pass through, while they employed themselves in throwing darts, &c. at their guides.

ELEVATION, [from *elevo*, I lift up,] the altitude of any thing.

ELEVATION, ANGLE OF, in gunnery, that comprehended between the horizon and the line of direction of a cannon or mortar, or it is that which the chase of a piece, or the axis of its hollow cylinder, makes with the plane of the horizon.

ELEVATION, in architecture, the same with an orthographic, or upright draught of a building.

ELEVATION OF THE HOST, in the church of Rome, that part of the mass where the priest raises the host above his head for the people to adore.

ELEVATOR, in anatomy, the name of several muscles, so called from their serving to raise the parts of the body to which they belong.

ELEVATORY, in surgery, an instrument for raising depressed or fractured parts of the skull, to be applied after the integuments and periosteum are removed. See **SURGERY**.

ELEUSINIA, in Grecian antiquity, a festival held in honour of Ceres, every fourth year by some states; by others every fifth. The Athenians celebrated it at Eleusis, whence the name. Ceres, says Isocrates, wandering in quest of her daughter Proserpine, came into Attica, where some good offices were done her, which it is unlawful for those who are not initiated to hear. In return she conferred two unparalleled benefits; to wit, the knowledge of agriculture, by which the human race is raised above the brute creation; and the mysteries, from which the partakers derive sweeter hopes than other men enjoy, both as to the present life and to eternity. It was the popular opinion, that the Eleusinian goddesses suggested prudent counsel to their votaries, and influenced their conduct; that these were respected in the infernal regions, and had precedence in the assemblies of the blessed; while the unhallowed were in utter darkness, wallowing in mire, or labouring to fill a leaky vessel. The Athenians were solicitous to secure these advantages to their children, by having them initiated, as soon as was allowed. Ceres was supposed to be particularly partial to Eleusis, and its vicinity. There

stood the memorials of her presence and of her bounty; the well, Callichorus, by which she had rested, in the reign of Erectheus; the stone on which she sat, named the sorrowful; the Rharian plain, where barley was first sown; and the threshing floor and altar of Triptolemus, a herdsman whom she instructed in the culture of that grain, the use of which succeeded to acorns. Her mysteries continued to possess a pre-eminence in holiness, and to be accounted as much superior to all other religious festivals as the gods were to the heroes. Even the garments worn at the solemnity were supposed to partake of their efficacy, and to be endued with signal virtues. It was usual to retain them until they were perishing; and then to dedicate them in the temple, or to reserve them for enwrapping new-born children.

ELEUSIS, in ancient geography, a town in Attica between Megara and the Piræus, celebrated for the festivals of Ceres.

ELEUTHERA, or **ALABASTER ISLAND**, one of the Bahama islands. Lon. 76. 31. W. Lat. 25. 14. N.

ELEUTHERIA, a festival celebrated at Plataea, in honour of Jupiter Eleutherius, or the assessor of liberty, by delegates from almost all the cities of Greece. Its institution originated from the victory obtained by the Grecians under Pausanias, over Mar-donius the Persian general, in Plataea: an altar and statue were erected to Jupiter Elutherius, who had freed the Greeks from the tyranny of the barbarians. It was further agreed upon in a general assembly, by the advice of Aristides the Athenian, that deputies should be sent every fifth year, from the different cities of Greece, to celebrate Eleutheria, festivals of liberty. The Plataeans celebrated also an anniversary festival in memory of those who had lost their lives in that famous battle.

ELGIN, or **MORRAYSHIRE**, a county of Scotland.

ELGIN, or **ELGYN**, the capital of the above county, about 6 miles N. of the Spey, 30 E. of Inverness. Lon. 2. 25. W. Lat. 57. 40. N.

ELI, [עֵלִי, Heb. *i. e.* offering,] high priest of Israel, and the last of the judges, except Samuel, succeeded Samson, about A.M. 2865; and B.C. 1139. His piety, with the wickedness of his sons, and the consequent misfortunes of his family and the commonwealth, are recorded in 1 Sam. iv. xiv. and xxii. He died in the fortieth year of his government, and ninety-eighth of his age, A. M. 2905, and B. C. 1099.

ELIAS, or **ELIJAH**, [from *אל*, God, and *יה*, the Lord,] an eminent prophet of Israel, who escaped the common lot of mankind, by not suffering death; being translated about A. M. 3108, B. C. 896. His miracles, persecutions, and final exit, are recorded in 1 Kings xvii.—xxi. 2 Kings i. and ii. He appears to be the first person on record who made use of that part of rhetoric called irony, 1 Kings xviii. 27.

ELICIT, [*elicitus*, Latin,] in ethics, is applied to an act of the will immediately produced by, and of, the will, and received within the same: as to be willing, unwilling, loving, hating, &c. Acts of which nature are termed elicit, because that, being before in the power of the will, they are now brought forth into act. But they are so far intrinsic, that some authors consider them as the will itself, and deny that they ought to be distinguished from it any more than light is to be distinguished from the sun.

ELIHU, [from *אלי*, and *יהוה*, Heb. *i. e.* he is my God,] the son of Barachel the Buzite, a descendant of Buz, the son of Nahor, Abraham's brother, and the youngest of Job's friends who visited him in his affliction. His remarkable speech to Job and his senior friends, is recorded in the thirty-second and five following chapters. From some passages in that speech, particularly in chapter xxxiii. ver. 4 and 6, as well as from the propriety of the sentiments expressed in it, and the signification of the name Elihu, and more especially from the Almighty himself being introduced as the next speaker, some commentators have supposed that our Saviour is meant by this personage. But the particular mention that is made of Elihu's parentage, and ancestors, seems to carry a decisive refutation of this conjecture. Another conjecture, that Elihu was, in fact, the author of the book of Job, appears to be much better founded, from the 15th and 16th verses of chapter xxxii. where he seems to speak of himself as the writer of the narrative, and of the effect of his words upon Job's three senior friends. These two verses are indeed evidently a parenthesis, and cannot, by any construction of language, be reckoned a part of the speech, which precedes and follows them.

ELIJAH. See **ELIAS**.

ELIOTT, or **ELLIOT**, **GEORGE AUGUSTUS**, Lord Heathfield, was the youngest son of the late Sir Gilbert Elliott, Bart. of Stobs, in Roxburghshire; and was born at Stobs in 1718. He received the first rudiments of his education under a private tutor; and was early sent to the university of Leyden, where he made considerable progress in classical learning, and spoke with fluency and elegance the German and French languages. Being designed for a military life, he was sent from thence to the celebrated *Ecole Royale du Genie Militaire* conducted by the great Vauban, at La Fere in Picardy; where he laid the foundation of what he so conspicuously exhibited at the defence of Gibraltar. He completed his military course on the continent by a tour, for the purpose of seeing in practice what he had studied in theory. Prussia was the model for discipline, and he continued some time as a volunteer in that service. He returned to Scotland in 1735, in the seventeenth year of age. In 1740 his uncle Col. Elliott appointed him his adjutant of the second troop of horse grenadiers. With these troops he went upon service to Germany, and was with them in a variety of actions. At the battles of Dettingen and Fontenoy, he was wounded. In this regiment he bought the rank of captain and major, and afterwards purchased the lieutenant-colonelcy from Colonel Brewerton, who succeeded to his uncle. Soon after this he was appointed aid-de-camp to George II. and was distinguished for his military skill and discipline. In March 1759, he quitted the second troop of horse grenadier guards, being selected to raise, form, and discipline, the first regiment of light horse, called after him, Elliott's. As soon as they were raised and formed, he was appointed to the command of the cavalry in the expedition on the coast of France, with the rank of brigadier general. After this he passed into Germany, where he was employed on the staff, and greatly distinguished himself in a variety of movements. On the peace in 1763, his gallant regiment was reviewed by the king, when they presented to his majesty the standards which they had taken from the enemy. Gratified with their fine discipline and high character, the king asked General Elliott what mark of his favour he could bestow on his regiment equal to their merit? He answered, that his regiment would be proud if his majesty should think, that, by their services, they were intitled to the distinction of Royals. It was accordingly made a royal regiment, with this flattering title, "The fifteenth, or King's Royal Regiment of Light Dragoons." At the same time the king expressed a desire to confer some honour on the general himself; but the latter declared, that the honour and satisfaction of his majesty's approbation of his services was his best reward. During the peace he was not idle. His great talents in the various branches of the military art gave him ample employment. He was appointed to the command of Gibraltar in a fortunate hour for the safety of that important fortress. The system of his life, as well as his education, peculiarly qualified him for his trust. He was perhaps the most abstemious man of the age; neither indulging himself in animal food nor wine. He never slept more than four hours at a time; so that he was up later and earlier than most other men. He so inured himself to habits of hardness, that the things which are difficult and painful to other men were to him his daily practice and rendered pleasant by use. It could not be easy to starve such a man into a surrender, nor possible to surprise him. The example of the commander in chief in a besieged garrison had a most persuasive efficacy in forming the manners of the soldiery. Like him his brave followers came to regulate their lives by the most strict rules of discipline before there arose a necessity for so doing; and severe exercise, with short diet, became habitual to them by choice. The military system of discipline which he introduced, and the preparations which he made for his defence, were contrived with so much judgement, and executed with so much address, that he was able with a handful of men to preserve his post against an attack, the constancy of which, even without the vigour, had been sufficient to exhaust any common set of men. Collected within himself, he in no instance destroyed, by premature attacks, the labours which would cost the enemy time, patience, and expence, to complete; he deliberately observed their approaches, and seized on the proper moment, with the keenest perspection, in which to make his attack with success. He never spent his ammunition in useless parade, or unimportant attacks. He never relaxed from his discipline by the appearance of security, nor hazarded the lives of his garrison by

wild experiments. By a cool and temperate demeanour, he maintained his station for three years of constant investment in which the powers of Spain were employed. All the eyes of Europe were on this garrison; and his conduct has justly exalted him to the most elevated rank in the military annals of Britain. On his return to England, the gratitude of the British senate was as forward as the public voice in giving him that distinguished mark his merit deserved. Both houses of parliament voted an unanimous address of thanks to the general. The king conferred on him the honour of Knight of the Bath, with a pension during his own, and a second life, of his own appointment; and on June 14, 1787, his majesty advanced him to the peerage by the title of Lord Heathfield, Baron Gibraltar, permitting him to take, in addition to his family arms, the arms of the fortress he had so bravely defended, to perpetuate to futurity his noble conduct. Lord Heathfield died on the 6th July, 1790, at his chateau at Aix-la-chapelle.

ELIPHAZ, [from *עֵלִיפָאז*, *i. e.* the strength of God,] the eldest of Job's three uncharitable friends. From his being stiled the Temanite, it is evident that he was a descendant of Esau, by Teman, the son of Eliphaz, and grandson of Esau, the first duke of Edom; which contributes to assist the chronologist in fixing the period when Job lived.

ELIQUATION, in chemistry, an operation by which a more fusible substance is separated from one that is less so, by means of a heat sufficiently intense to melt the former, but not the latter. Thus an alloy of copper and lead may be separated by a heat capable of melting the latter, but not the former.

ELIS, or **ELEA**, in ancient geography, a fertile district of Peloponnesus, famous for raising flax, which equalled that of Judæa in fineness, though not so yellow, and grew nowhere else in Greece.

ELIS, the capital of the above district, situated on the Peneus, which ran through it. It was the country of Phædo the friend of Plato, and of Pyrrho the founder of the Pyrrhonists.

ELISHA, [from *עִישָׁא*, *i. e.* the salvation of God,] or Eliseus, the son of Shaphat, an eminent prophet of Israel, the disciple and successor of Elijah. His call, with his various miracles and prophecies are recorded in 1 Kings, xix. xxi. 2 Kings, ii.—viii. and xiii. He died much lamented by Joash, king of Israel, about A. M. 3165.

ELISHAH, the son of Javan, and grandson of Japhet, is supposed by chronologists to have been the progenitor of the inhabitants of Æolia, in lesser Asia, and of Elis and Alisium in Peloponnesus.

ELISION, in grammar, the cutting off, or suppressing of a vowel at the end of a word, for the sake of sound, or measure, the next word beginning with a vowel.

ELISIONS, are pretty frequently met with in English poetry, but more frequently in the Latin, French, &c. They are chiefly used in suppressing the *a*, *e*, and *i*; though they may also suppress any of the other vowels.

ELIXIR, in medicine, a compound tincture extracted from many efficacious ingredients. The difference between a tincture and an elixir seems to be this, that a tincture is drawn from one ingredient, sometimes with an addition of another to open it, and to dispose it to yield to the menstruum; whereas an elixir is a tincture extracted from several ingredients at the same time.

ELIZABETH, queen of England, was the daughter of Henry VIII. by Anne Boleyn, and born in 1533. She was educated in the Protestant religion, and in the reign of Mary was sent to the Tower, from whence she was afterwards removed to Woodstock. On the death of her sister in 1558 she was proclaimed queen, to the great joy of the nation. Philip of Spain made her an offer of marriage, which she civilly declined. In restoring the reformation she conducted herself with great prudence and moderation. One of the first measures of her reign was to send succours to the reformed party in Scotland, which produced the treaty of Edinburgh, and the departure of the French from that country. Elizabeth was now considered as the head of the Protestant interest, and she gave her assistance to the French Hugonots, who put Hayre de Grace into her hands. At home rigorous measures were adopted against the Roman Catholics and puritans. Dudley, earl of Leicester, became the queen's favourite, and had the ambition to aspire to her hand. She, however, made an ineffectual effort to unite him to Mary, queen of Scots. That unfortunate princess took

took refuge in England from her subjects in 1568, and was kept in confinement till 1586, when she was basely tried and executed. Elizabeth endeavoured to clear herself of the odium of this transaction, by causing her secretary, Davison, to be prosecuted for issuing a warrant for the execution without her knowledge. The French and Spaniards having formed a league for the extirpation of heresy, induced Elizabeth to protect the Protestants, and this she did so effectually as to separate the United Provinces from the dominion of the latter power. The king of Spain, in return, sent a body of troops to invade Ireland, but they were all cut off by lord Grey, the deputy. In the mean time various offers of marriage were made to the queen, the most remarkable of which was that of the duke of Anjou, who came to England for the purpose, but after staying some time, the affair was broken off. In 1588 Philip sent against England his famous armada, to which the pope gave the appellation of invincible. On this occasion the queen distinguished herself by her great presence of mind, and inflexible courage. She rode on horseback in the camp at Tilbury, and inspired her people with heroism by her deportment and her speeches. The English fleet, however, assisted by the winds, prevented the Spaniards from landing, and their boasted armada was destroyed. On the death of Leicester, Robert Devereux, earl of Essex, became the queen's favourite, who was, however, executed for treason in 1601. Her attention to government, did not suspend her pursuit of learning. Ascham, in his Schoolmaster, tells us, that about 1563, five years after her accession, she being then at Windsor, besides her perfect readiness in Latin, Italian, French, and Spanish, she read more Greek in one day than some prebendaries of that church read Latin in a whole week. She employed Sir John Fortescue to read to her Thucydides, Xenophon, Polybius, Euripides, Æschines, and Sophocles. She was also skilled in the art of poetry, as appears from the several scraps which have been preserved, from the testimony of Puttenham, a contemporary writer. Mr. Walpole mentions as an instance of her genius, and knowledge of Latin, her extempore reply to an insolent prohibition delivered to her from Philip II. by his ambassador, in this tetrastich:

Te veto, ne pergas bello defendere Belgas:
Quæ Dracus eripuit, nunc restituantur oportet:
Quas pater evertit, jubeo te condere cellas:
Religio papæ fac restituat ad unguem.

"She instantly answered him, with as much spirit as she used to return his invasions."

Ad Græcas, bone rex, fient mandata kalendas.

Being pressed by a Romish priest, during her persecution, to declare her opinion concerning the real presence of Christ's body in the wafer, she answered,

Christ was the Word that spake it;
He took the bread, and brake it;
And what that Word did make it,
That I believe, and take it.

Fuller.

She died at Richmond, the 24th March 1603, aged 70, having reigned 44 years; and was interred in the chapel of Henry VII. in Westminster Abbey. Her successor James erected a magnificent monument to her memory. Several of her letters, prayers, translations, &c. written with her own hand, are extant.

ELIZABETH, empress of Russia, daughter of Peter the Great, (whence her patronymic title of Petrovna,) distinguished herself by her signal clemency. She made a vow, that no person should be put to death in her reign, and she strictly observed it. The example was followed, and confirmed by law, under the late Catharine II. Elizabeth died in 1762, in the 21st year of her reign, and 52d of her age.

ELIZABETH ISLANDS, 16 small islands of Massachusetts bay, on the S. E. side of Buzzard's Bay, extending S. W. from Barnstable county, and bearing N. W. from Martha's vineyard. Cattahunk, Nashawin, Nashawenna, Pasqui, and Pinequese, are the chief of them. They are situated between Lon. 70. 38. and 70. 56. W. and between Lat. 41. 24. and 41. 32. N.

ELIZABETH-TOWN, a post-town of N. Carolina, capital of Bladen county, 47 miles N. W. of Wilmington.

ELIZABETH-TOWN, a town of New Jersey, in Essex county, 6 miles S. of Newark, and 15 S. W. by W. of New York.

ELIZABETH-TOWN, a post town of Maryland, capital of Wash-

ington county, formerly called Hagar's town, seated in the vale of Conecocheaque, 6 miles from the Potomac.

ELK, in zoology. See CERVUS.

ELK, a navigable river of the United States in Maryland.

ELKHOLM, a sea-port of Sweden, in Bleking, on the Baltic, 24 miles W. of Carlsroon.

ELKRIDGE, a town of Maryland, 8 miles S. W. of Baltimore, and 19 N. W. of Annapolis.

ELKTON, a town of Maryland, in Cecil county, 47 miles S. W. of Philadelphia.

ELL, [*eln*, Sax.] a measure containing 45 inches, or a yard and a quarter.

ELL, is a measure, which obtains, under different denominations, in most countries, whereby cloths, stuffs, linens, silks, &c. are usually measured; answering nearly to the yard of England, the canna of Italy, the vara of Spain, the palm of Sicily, &c. The ells most frequently used with us are the English and Flemish; the former containing three feet nine inches, or one yard and a quarter; the latter only 27 inches, or three quarters of a yard. The ell in Scotland contains 37½ English inches.

ELLERENA, or ELERENA, a town of Spain, in Estremadura, 55 miles N. of Seville.

ELLEDON, a town of Northumberland, 28 miles N. W. of Newcastle. Lon. 1. 49. W. Lat. 55. 20. N.

ELLESMERE, a town and fertile district, in Shropshire, 16 miles N. N. W. of Shrewsbury.

ELLICHPOUR, a city of Hindostan, and capital of a circar of the same name, in the county of Berar, 144 miles N. E. of Aurungabad.

ELLIPSIS, [from *ἐλλειψις*, of *ἐλλείπω*, *I want*,] in geometry, a figure produced from the section of a cone. The reason of the name is this: let BA, ED, be any two conjugate diameters of an ellipsis, (fig. 16. Plate LIV, where they are the two axes,) at the end A, of the diameter AB, raise the perpendicular AF, equal to the latus rectum, or parameter, being a third proportional to AB, ED, and draw the right line BF; then if any point P be taken in BA, and an ordinate PM be drawn, cutting BF in N, the rectangle under the absciss AP, and the line PN will be equal to the square of the ordinate PM. Hence drawing NO parallel to AB, it appears that this rectangle, or the square of the ordinate, is less than that under the absciss AP, and the parameter AF, by the rectangle under AP and OF, or NO and OF; on account of which deficiency, Apollonius first gave this curve the name of an ellipsis, from *ἐλλείπειν*, to be deficient.

ELLIPSIS, in grammar, a figure of syntax, wherein one or more words are not expressed; and from this deficiency it has got the name ellipsis.

ELLIPSIS, [*ἐλλειψις*,] in rhetoric, a figure nearly allied to preterition, when the orator, through transport of passion, passes over many things; which had he been cool, ought to have been mentioned. In preterition, the omission is designed; which, in the ellipsis, is owing to the vehemence of the speaker's passion, and his tongue not being able to keep pace with the emotion of his mind.

ELLIPTIC, or ELLIPTICAL, something belonging to an ellipsis. Thus we meet with elliptical compasses, elliptic conoid, elliptic space, elliptic stairs, &c. The elliptic space is the area contained within the curve of the ellipsis, which is to that of a circle described on the transverse axis, as the conjugate diameter is to the transverse axis; or it is a mean proportional between two circles, described on the conjugate and transverse axis.

ELLIPTOIDES, in geometry, a name used by some to denote infinite ellipses, defined by the equation $ay^{\frac{m+n}{n}} = bx^{\frac{m+n}{n}}$.

($a - x$). Of these there are several sorts: thus, if $ay^3 = bx^2$ ($a - x$) it is a cubical elliptoid; and if $ay^4 = bx^2 (a - x)^3$, it denotes a biquadratic elliptoid, which is an ellipsis of the third order in respect of the Apollonian ellipsis.

ELLISIA, a genus of the monogynia order, and pentandria class of plants; natural order, Luride. Corolla monopetalous, funnel-shaped; berry carnosous, bilocular; seeds two, mucicated or set with small raised points, the one higher than the other. One species, a native of Virginia.

ELM, [*ulmus*,] in botany. See ULMUS. The elm is very serviceable

serviceable in places where it may lie continually dry, or wet in extremes. Accordingly, it is proper for water-works, mills, the ladles and soles of the wheel-pipes, pumps, aqueducts, pales, and ship-planks beneath the water-lines. It is also of use for wheel-wrights, handles for single saws, axle-trees, and the like. The clearness of the grain, makes it also fit for all kinds of carved works, and most ornaments relating to architecture. This wood may be propagated by the seed, and by layers or suckers taken from the roots of old trees: those raised from layers always strike better roots, thrive more quickly than the other, and do not shoot forth so many suckers; for which reason this method deserves to be more generally practised. The elm naturally delights in a stiff, strong soil, where it grows comparatively slow; but if it be planted in rich, light land, it vegetates most luxuriantly. In the latter case, however, its wood is light, porous, and of little value, compared with that produced on richer soils: the latter is of a closer and stronger texture, and possesses, near the heart, the colour and almost the weight and hardness of iron. On such lands, therefore, the elm becomes very profitable, and is one of those deciduous trees, which ought to be industriously cultivated. This beautiful tree is of great value; and well adapted for planting shady walks, as it does not destroy the grass, and its leaves are relished by horses, cows, goats, hogs, and sheep, all of which eat them eagerly. Its wood, being hard and tough, is used for making axle-trees, mill-wheels, keels of boats, chairs, and coffins: it is also frequently changed by art, so as completely to resemble mahogany; for this purpose, it is sawed into thick planks, stained with aqua-fortis, and rubbed over with a tincture, of which alkannet, aloes, and spirit of wine, are the principal ingredients. Silkworms eat the leaves with avidity.

ELMACINUS, **GEORGE**, author of a History of the Saracens, was born in Egypt towards the middle of the 13th century. His history comes down from Mohammed to the year of the Hegira 512, answering to A. D. 1134; in which he sets down year by year, in a very concise manner, whatever regards the Saracen empire, intermixed with some passages relating to the eastern Christians. His abilities must have been considerable; since, though he professed Christianity, he held an office of trust near the persons of the Mohammedan princes. He was son to Yaser Al Ahmid, secretary to the council of war under the sultans of Egypt for 45 years; and in 1238, when his father died, succeeded him in his place. His history of the Saracens was translated from Arabic into Latin by Erpinus; and printed in these two languages in folio, at Leyden, in 1625. Erpinus died before the publication; but Golius took care of it, and prefixed a preface. It was dedicated by Erpinus's widow to Dr. Andrew's, bishop of Winchester.

ELNIA, a town of Russia, in the government of Smolensko, 32 miles E. S. E. of Smolensko.

ELOCUTION, [*elocutio*, Lat.] generally speaking, signifies the selecting and adapting of words and sentences, to the things or sentiments intended to be expressed. It is also used to denote the just and graceful management of the voice, countenance, and gesture, when speaking: in which sense it is synonymous with what is variously called a good delivery, eloquence, or the art of speaking and writing with accuracy, elegance, and perspicuity. True eloquence depends principally on the vivacity of the imagination; for it not only communicates grace and ornament, but also life and motion to discourse. See **ORATORY**.

ELOGY, [*elogium*,] a praise, or panegyric, bestowed on any person or thing, in consideration of its merit.

ELOGY, or **EULOGIUM**, should not have so much as one epithet, properly so called, nor two words synonymous: it should strictly adhere to truth; for extravagant and improbable elogies rather lessen the character of the person or thing they would extol. The beauty of elogy consists in expressive brevity.

ELOHI, **ELOHIM**, or **ELOI**, [עֲלֹהִים, Heb. אֱלֹהִים, Syr.] in scripture, one of the names of God. But it is to be observed, that angels, princes, great men, judges, and even false gods, are sometimes called by this name. The sequel of the discourse, is what assists us in judging rightly concerning the true meaning of this word. It is the same as Eloha. The one is the singular, and the other the plural. Nevertheless Elohim is often constructed in the singular number, particularly when the true God is spoken of; but when false gods are spoken of, it is construed rather in the plural.

ELOINED, in law, signifies restrained or hindered from doing something: thus it is said, that if those within age be eloined, so that they cannot sue personally, their next friend shall sue for them.

ELONGATION, in astronomy, the digression or recess of a planet from the sun, with respect to an eye placed on our earth. The term is chiefly used in speaking of Venus and Mercury, the arch of a great circle intercepted between either of these planets and the sun being called the elongation of that planet from the sun. See **ASTRONOMY**.

ELONGATION, **ANGLE OF**, is an angle contained under lines drawn from the centres of the sun and planet, to the centre of the earth.

ELONGATION, in surgery, is an imperfect luxation, occasioned by the stretching or lengthening of the ligaments of any joint. See **SURGERY**.

ELOPEMENT, is when a married woman of her own accord departs from her husband, and dwells with an adulterer; for which without voluntary reconciliation to the husband, she shall lose her dower by the statute of Westminster, ii. c. 34. If a wife willingly leaves her husband, and goes away and continues with her avouter, she shall be barred for ever of action to demand her dower that she ought to have of her husband's lands, if she is convicted thereof; except that her husband willingly and without coercion of the church, reconciles her, and suffers her to dwell with him; in which case she shall be restored to her action. 13 Ed. I. st. i. c. 34. See **ADULTERY**.

ELOPS, [ελος], a genus of fishes of the order abdominales. Tail armed above and beneath; body long, and differing from the salmon in wanting the fleshy back-fin. Head large, smooth, shining, compressed, and flattened; eyes half-covered with the skin of the head; body slender, covered with large angular scales; tail deeply cleft, with a bony scale or spine, above and beneath, before it. It has one species, generally about fourteen inches long, it is found on the coasts of Carolina.

ELORA, a town of Hindostan, in the country of Aurungabad; 13 miles N. of Aurungabad.

ELOTZ, a town of Russia, in the government of Orloff, 112 miles E. N. E. of Orel.

ELPHIN, a town of Ireland, in the county of Roscommon, 8 miles N. of Boyle, and 25 N. of Dublin.

ELRICH, a town of Germany, in Upper Saxony.

ELSIMBURG, or **HELSIMBURG**, a port town of Sweden, in the province of Gothland, and territory of Schonen, 7 miles E. of Elsinore. Lon. 13. 20. E. Lat. 56. 2. N.

ELSINEUR, **ELSINOOR**, **ELSNORE**, or **HELSINGOER**, a port town of Denmark, seated on the Sound, in the isle of Zealand. Every vessel, as she passes, lowers her top-sails, and pays a toll at Elsinore. Lon. 12. 37. E. Lat. 56. 3. N.

ELTMAN, a town of Germany, in Franconia, and bishopric of Wurzburg, 8 miles W. N. W. of Bamberg.

ELTZ, a town of Lower Saxony, 10 miles S. W. of Hildesheim. Lon. 10. 5. E. Lat. 50. 5. N.

ELVAS, a large town, and one of the most important in Portugal, in the province of Alentejo, a few miles from the frontiers of Spanish Estramadura. It is built on a mountain, and is strongly fortified with works of free-stone. It is 50 miles N. E. of Evora, and 100 E. of Lisbon. Lon. 7. 3. W. Lat. 38. 43. N.

ELVELA, in botany, a genus of the natural order of fungi, belonging to the cryptogamia class of plants. The fungus is turbinate, or like an inverted cone.

ELUL, [אֱלּוּל] in chronology, the 12th month of the Jewish civil year, and the 6th of the ecclesiastical: it consisted of only 29 days, and answered pretty nearly to our August.

ELUTRIATION, in chemistry, an operation performed by washing solid substances with water, stirring them well together, and hastily pouring off the liquid, while the lighter part remains suspended in it, that it may thereby be separated from the heavier part. By this operation metallic ores are separated from earth, stones, and other unmetallic particles adhering to them.

ELWANGEN, a principality of Germany, in Suabia, bordering on the late duchy of Wurtemberg.

ELWANGEN, the capital of the above late principality, 25 miles S. W. of Anspach, and 32 N. of Ulm.

ELY, a city and bishop's see of Cambridgeshire, about 17 miles N. of

N. of Cambridge. It is a county of itself, including the territory around; and has a judge who determines all causes civil and criminal within its limits.

ELY, ISLE OF, a fenny district in Cambridgeshire, near Bedford Level, which comprehends the town and diocese of Ely, and is partly overflowed by water in winter. Immense numbers of wild fowls are taken in it.

ELYMAIS, in ancient geography, the capital of Elam, or Persia.

ELYMUS, LYME-GRASS, a genus of the digynia order, and triandria class of plants; natural order, Gramina. The calyx is lateral, bivalved, aggregate, and multilorous. It has eleven species.

ELYOT, SIR THOMAS, a gentleman eminent for learning in the 16th century, who was educated at Oxford, travelled into foreign countries. Henry VIII. conferred the honour of knighthood on him, and employed him in several embassies; particularly in 1532, to Rome, about the divorce of queen Catharine, and afterwards to Charles V. about 1536. He wrote, "The Castle of Health," "The Governor," "Banquet of Sapience," "Of the Education of Children," "De Rebus memorabilibus Angliæ," and other books; and was highly esteemed by all his learned contemporaries.

ELYSIAN FIELDS. See the next article.

ELYSIUM, [ΕΛΥΣΙΟΣ,] in the ancient mythology, was represented as a place in the inferi or lower world, furnished with fields, meads, agreeable woods, groves, shades, rivers, &c. whither the souls of good people were supposed to go after this life. Orpheus, Hercules, and Aeneas, were said to have descended into Elysium in their life-time, and to have returned again: (Virg. lib. vi. ver. 638, &c.) Tibullus (lib. i. eleg. 3.) gives us fine descriptions of the Elysian fields. Virgil assigns Elysium to patriots who died for their country, to those of pure lives, to truly inspired poets, to the inventors of arts, and to all who have done good to mankind. Some authors take the fable of Elysium to have been borrowed from the Phœnicians; and suppose the name Elysium formed from the Phœnician אלז alaz, or אלז alats, or אלז alas, to rejoice, or to be in joy; the letter a being only changed into e. Others derive the word from the Greek ελυω, solvo, I let loose, or disengage; because here men's souls are freed or disincumbered from the fetters of the body.

ELZEVIUS, LEWIS, BONAVENTURE, ABRAHAM, LEWIS, and DANIEL, five celebrated printers at Amsterdam and Leyden, who greatly adorned the republic of letters by many beautiful editions of the best authors of antiquity. They fell somewhat below the Stephensens in point of learning, as well as in their editions of Greek and Hebrew authors; but as to the choice of good books, they seem to have equalled, and in the neatness and elegance of their small characters, greatly to have excelled them. Their Virgil, Terence, and Greek Testament, have been reckoned their master-pieces; and are indeed so very fine, that they justly gained them the reputation of being the best printers in Europe. The first Lewis Elzevir began to be famous at Leyden in 1595, and was remarkable for being the first who observed the distinction between the *v* consonant and *u* vowel, which had been recommended by Ramus and other writers long before, but never regarded. Daniel died in 1680 or 1681; and though he left children who carried on the business, is esteemed the last of his family who excelled in it. The Elzevirs have printed several catalogues of their editions; but the last, published by Daniel, is considerably enlarged, and abounds with new books. It was printed in 12mo, at Amsterdam, in 1674, and divided into 7 volumes.

EMANCIPATION, in the Roman law, the setting free a son from the subjection of his father; so that whatever moveables he acquires belong in property to him, and not to his father, as before emancipation. Emancipation puts the son in a capacity of managing his own affairs, and of marrying without his father's consent, though a minor. There were two kinds of emancipation, viz.

1. EMANCIPATION, EXPRESS, where the father declared before a judge, that he emancipated his son.

2. EMANCIPATION, TACIT, by the son's being promoted to some dignity, by his coming of age, or by his marrying, in all which cases he became his own master of course.

EMARGINATED, among botanists, an appellation given to such leaves as have a little indenting on their summits: when this

indenting is terminated on each side by obtuse points, they are said to be obtusely emarginated; whereas when these points are acute, they are called acutely emarginated.

EMBALMING is the opening of a dead body, taking out of the intestines, and filling of the place with odoriferous and desiccative drugs and spices, to prevent its putrefying. The Egyptians excelled all other nations in the art of preserving bodies from corruption; for some, that they have embalmed upwards of 2000 years ago, remain whole to this day, and are often brought into other countries as great curiosities. Their manner of embalming was thus: they scooped the brains with an iron scoop out at the nostrils, and threw in medicaments to fill up the vacuum: they also took out the entrails, and having filled the body with myrrh, cassia, and other spices, except frankincense, proper to dry up the humours, they pickled it in nitre, where it lay soaking for 70 days. The body was then wrapped up in bandages of fine linen and gums, to make it stick like glue; and so was delivered to the kindred of the deceased, entire in all its features, the very hairs of the eye-lids being preserved. They used to keep the bodies of their ancestors, thus embalmed, in little houses magnificently adorned, and took great pleasure in beholding them, alive as it were, without any change in their size, features, or complexion. The Egyptians also embalmed birds, &c. The prices for embalming were different; the highest was a talent, the next 29 minæ, and so decreasing to a very small matter; but they who had not wherewithal to answer this expence, contented themselves with infusing, by means of a syringe, through the fundament, a certain liquor extracted from the cedar; and leaving it there, wrapped up the body in salt of nitre: the oil thus preyed upon the intestines, so that when they took it out, the intestines came away with it, dried, and not in the least putrefied: the body being enclosed in nitre, grew dry, and nothing remained besides the skin glued upon the bones. The method of embalming used by the modern Egyptians, according to Maillet, is to wash the body several times with rose water, which he elsewhere observes, is more fragrant in that country than with us; they afterwards perfume it with incense, aloes, and other odours, of which they are by no means sparing; and then they bury the body in a winding sheet, made partly of silk and partly of cotton, and moistened, as is supposed, with some sweet scented water or liquid perfume, though Maillet uses only the term moistened; this they cover with another cloth of unmixed cotton, to which they add one of the richest suits of clothes of the deceased. The expence, he says, on these occasions, is very great, though nothing like what the genuine embalming cost in former times.

EMBARCADERO, in commerce, a Spanish term, much used along the coasts of America, particularly those on the South Sea; signifying a place which serves some other city farther within land, as a port, for embarking and disembarking commodities. Thus Calamo is the embarcadero of Lima, the capital of Peru; and Arica the embarcadero of Potosi.

EMBARGO, in commerce, an arrest on ships or merchandise, by public authority; or a prohibition of state, commonly on foreign ships, in time of war, to prevent their going out of port, sometimes to prevent their coming in, and sometimes both for a limited time. The king may lay embargoes on ships, or employ those of his subjects, in time of danger, for the service and defence of the nation: but they must not be for the private advantage of a particular trader or company; and therefore a warrant to stay a single ship is no legal embargo. No inference can be made from embargoes which are only in time of war, and are a prohibition by advice of council, and not at prosecution of parties. If goods be laden on board, and after an embargo or restraint from the prince or state comes forth, and then the master of the ship breaks ground, or endeavours to sail, if any damage accrues, he must be responsible for the same; the reason is, because his freight is due, and must be paid, even though the goods be seized as contraband.

EMBASSADOR, or AMBASSADOR, a public minister sent from one sovereign prince, as a representative of his person, to another.

EMBDEN, a county of Germany, in the late circle of Westphalia, called also EAST FRIESLAND, containing several towns and villages.

EMBDEN, a strong city, the capital of the above county, 23 miles N. E. of Groningen.

EMBER-DAYS. See **EMBER-WEEKS.**

EMBERIZA, a genus of the class and order aves passeress. Bill conical, the mandibles recede from each other towards the base; inferior mandible has the sides narrowed inwards, upper one is still narrower. There are about threescore species.

E. CITRINELLA, the **YELLOW-HAMMER**, has a blackish tail, only the two outward side-feathers are marked on the inner edge with a sharp white spot. It builds its nest on the ground in meadows.

E. HORTULANA, the **ORTOLAN**, has black wings; the first three feathers on the tail are white on the edges, only the two lateral are black outwardly. The orbits are naked and yellow: the head is greenish, and yellow towards the inferior mandible. It feeds principally upon the panic grass; grows very fat; and is reckoned a delicate morsel by certain epicures, especially when fattened artificially. These birds are found in several parts of Europe, but are not met with in Britain.

E. NIVALIS, the great pyed mountain finch of Ray, and the snow bird of Edwards, has white wings, but the outer edge of the prime feathers are black; the tail is black, with three white feathers on each side. These birds are called in Scotland **Snow-Flakes**, from their appearance in hard weather and in deep snows. Their appearance is a certain fore-runner of hard weather, and storms of snow, being driven by the cold from their common retreats. Their progress southward is supposed to be thus; Spitzbergen and Greenland, Hudson's Bay, the Lapland Alps, Scandinavia, Iceland, the Ferroe Isles, Shetland, Orkneys, Scotland, and the Cheviot hills. They visit at that season all parts of the northern hemisphere, Prussia, Austria, and Siberia. They arrive lean, and return fat. In Austria, they are caught and fed with millet, and, like the Ortolan, grow excessively fat.

E. ORYZIVORA, or the **RICE BIRD**, is peculiar to America, where its depredations on the rice and maize, subject it to the peculiar aversion of the farmer. These birds often mingle with birds of other species, as the red winged oriole, and the blue jay. They are occasionally kept for the sake of their music. See Plate LVIII.

EMBER WEEKS, by the canonists are called *quatuor anni tempora*, the four cardinal seasons, on which the circle of the year turns: and hence Henshaw takes the word to have been formed, viz. by corruption, from *tempora*. They are now chiefly taken notice of, on account of the ordination of priests and deacons; because the canon appoints the Sundays next succeeding the ember weeks, for the solemn times of ordination; though the bishops may ordain on any Sunday or holiday.

EMBEZZLEMENT, in law, by stat. 39 G. 3. c. 35, for protecting masters against embezzlements by their clerks and servants; servants or clerks, or persons employed for the purpose, or in the capacity of servants or clerks, who shall by virtue of such employment receive, or take into their possession, any money, goods, bond, bill, note, banker's draft, or other valuable security or effects, for or in the name, or on account of their master or employer; or who shall fraudulently embezzle, secrete, or make away with the same, or any part thereof; every such offender, shall be deemed to have feloniously stolen the same from his master or employer, for whose use, or on whose account, the same was delivered to, or taken into the possession of such servant, clerk, or other person, so employed, although such money, goods, bond, bill, note, banker's draft, or other valuable security, was or were not otherwise received into the possession of his or their servants, clerk, or other person so employed; and every such offender, his adviser, procurer, aider, or abettor, being thereof lawfully convicted or attainted, shall be liable to be transported beyond seas.

EMBLEM, [*εμβλημα*], a kind of painted ænigma, which, representing some obvious history, with reflections underneath, instructs us in some moral truth. See **ÆNIGMA**, **DEVISE**, &c. Such is that very significant image of Scævola holding his hand in the fire; with the words, "*Agere et pati fortiter Romanum est*. To do and suffer courageously is Roman." The emblem is somewhat plainer than the ænigma. Gale defines emblem an ingenious picture, representing one thing to the eye, and another to the understanding. The Greeks also gave the name *Emblems*, [*εμβλημα*], from [*εμβαλλειν*, to insert], to inlaid or Mosaic works, and even to all kinds of ornaments of vases, moveables, garments,

&c. And the Latins used *emblemata* in the same sense. Accordingly, Cicero reproaching Verres with having plundered statues and fine wrought works from the Sicilians; calls the ornaments, fixed to them (and which on occasion might be separated,) *emblemata*. Latin authors frequently compare the figures and ornaments of discourse to these *emblemata*. With us, emblem ordinarily signifies no more than a painting, basso-relievo, or other representation, intended to hold forth some moral or political instruction. What distinguishes an emblem from a devise is, that the words of an emblem have a full complete sense of themselves; nay, all the sense and signification which they have together with the figure. But there is a yet further difference between emblem and devise: for a devise is a symbol appropriated to some person, or that expresses something which concerns him particularly; whereas an emblem is a symbol that regards all the world alike. These differences will be more apparent, from comparing the emblem above quoted, with the devise of a candle lighted, and the words *Aliis in serviendo consumor*, "I waste myself in serving others."

EMBLEMETS, in law, signify the profits of land sown; but the word is sometimes used more largely, for any profits that arise and grow naturally from the ground, as grass, fruit, hemp, flax, &c.

EMBOLISMIC, or intercalary, [*εμβολισμος*] a term used by chronologists in speaking of the additional months and years, which they insert to bring the lunar to the solar year. Since the common lunar year consists of twelve synodic months, or 354 days nearly, and the solar consists of 365 days (throwing away the odd hours and minutes) it is plain that the solar year will exceed the lunar by about 11 days; and consequently in the space of about 33 years, the beginning of the lunar year will be carried through all the seasons, and hence it is called the moveable lunar year. This form of the year is used at this time by the Turks and Arabians; and because in three years' time the solar year exceeds the lunar by 33 days, therefore, to keep the lunar months in the same seasons and times of the solar year, or near it, chronologists added a whole month to the lunar year every third year, and so made it consist of 13 months; this year they called the embolismic year, and the additional month the embolismic, or embolimean, or intercalary month. This form of the year is called the fixed lunar year, and it was used by the Greeks and Romans till the time of Julius Cæsar.

EMBOSSING, or **IMBOSSING**, in architecture and sculpture, the forming or fashioning of works in relievo, whether cut with a chissel or otherwise. Embossing is a kind of sculpture, wherein the figures stick out from the plane whereon it is cut: and according as the figures are more or less prominent, they are said to be in alto, mezzo, or basso, relievo; or high, mean, or low, relief. See **ENCHASING**.

EMBOTHERIUM, in botany, a genus of the monogynia order, and tetrandria class of plants. No calyx; petals four, linear, oblique; follicle, round, unilocular, sharpened at both ends; seeds four or five, egg-shaped, compressed. It has four species.

EMBRACE THE VOLT, in the manege. A horse is said to embrace a volt, when working upon volts, he makes a good way every time with his fore-legs.

EMBRACEOR, among lawyers, a person, who, having received a reward so to do, comes to the bar with one of the parties, and speaks in the case; or privily labours the jury, or stands in court to over-look them, whereby they are awed or put in fear. Actions of this kind will be embracery, whether the jurors give verdict on the side of the party or not. The penalty of this offence is 20*l.* and imprisonment of the party at the discretion of the court; and may be prosecuted either by indictment at common law, as well as by action on the statute. But attorneys and other lawyers are excepted.

EMBRASURE, in architecture, the enlargement made of the aperture of a door or window, on the inside of the wall; its use being to give the greater play for the opening of the door, or casement, or to admit the more light. When the wall is very thick, they sometimes make embrasures on the outside.

EMBRASURE, in fortification, a hole or aperture in a parapet, through which the cannon are pointed to fire into the moat or field. See **FORTIFICATION**.

EMBROCATION, in surgery and pharmacy, is an external kind of remedy, which consists of an irrigation of the part affected, with

with some proper liquor, as oils, spirits, &c. by means of a woollen or linen cloth, or a sponge, dipped in the same.

EMBROIDERY is a work in gold, silver, or silk thread, wrought by the needle upon cloth, stuffs, or muslin, into various figures. In embroidering stuffs, the work is performed in a kind of loom; because the more the piece is stretched, the easier it is worked. As to muslin, they spread it upon a pattern ready designed; and sometimes, before it is stretched upon the pattern, it is starched, to make it more easy to handle. Embroidery on the loom is less tedious than the other, in which, while they work flowers, all the threads of the muslin, both lengthwise and breadthwise, must be continually counted; but, on the other hand, this last is much richer in points, and susceptible of greater variety. Cloths too much milled are scarce susceptible of this ornament, and in effect we seldom see them embroidered. The thinnest muslins are left for this purpose; and they are embroidered to the greatest perfection in Saxony: in other parts of Europe, however, they embroider very prettily, and especially in France. There are several kinds of embroidery: as, 1. Embroidery on the stamp; where the figures are raised and rounded, having cotton or parchment put under them to support them. 2. Low embroidery; where the gold and silver lie low upon the sketch, and are stitched with silk of the same colour. 3. Guimped embroidery: this is performed either in gold or silver; they first make a sketch upon the cloth, then put on cut vellum, and afterwards sew on the gold and silver with silk thread: in this kind of embroidery they often put gold and silver cord, tinsel, and spangles. 4. Embroidery on both sides, that which appears on both sides of the stuff. 5. Plain embroidery; where the figures are flat and even, without cords, spangles, or other ornaments.

EMBROIDERY, FOREIGN, STATUTES RESPECTING. By stat. 22. Geo. II. c. 36, no foreign embroidery, or gold and silver brocade, shall be imported, upon pain of being forfeited and burnt, and penalty of 100l. for each piece. No person shall sell, or expose to sale, any foreign embroidery, gold or silver thread, lace, fringe, brocade, or make up the same into any garment, on pain of having it forfeited and burnt, and penalty of 100l. All such embroidery, &c. may be seized and burnt; and the mercer, &c. in whose custody it was found, shall forfeit 100l.

EMBRYO. [*ἐμβρυον*.] See **FÆTUS**, and **GENERATION**.

EMBRYOTHLASTES, [from *ἐμβρυον*, an embryo, and *θλαω*, to break,] in surgery and midwifery, an instrument for breaking the bones of a dead child in the uterus, that it may be the more easily extracted.

EMBRYOTOMY, [from *ἐμβρυον*, and *τομή*, cutting,] the art or act of dissecting a fœtus.

EMBRYULCUS, [from *ἐμβρυον*, and *ελκυω*, to draw,] in surgery, an instrument for extracting a dead fœtus from the uterus.

EMBS, a river of Germany, which rises in Westphalia; and falls into Dolart Bay, a little below Embden.

EMBS, or **HOHEN-EMBS**, a small county of Germany, in Suebia, S. of the lake of Constance.

EMBS, or **EMS**, the capital of the above county, ten miles S. of Bregentz.

EMERALD, in lithology, a genus of precious stones belonging to the order of siliceous earths. The name is derived, according to some, from the Italian *smeraldo*, or the Arabian *zomorrad*. Cronstedt says, the emerald is the softest of all the precious stones, but other naturalists place it the next after the diamond in hardness. It is perhaps the most beautiful of all the gems, and according to Wallerius, when heated in the fire, changes its colour to a deep blue, and becomes phosphorescent; but recovers its green when cold. When pulverised it has a white appearance, and, with borax, melts to a very thin and colourless glass. It becomes electric by being rubbed, and some have the property of the tourmalin, viz. of being electrified by heat; and in that state attracting ashes or other light substances; though after having attracted the ashes, they retain them without any signs of repulsion. Hitherto it has been found only crystallized. The primitive form of its crystals is a regular six-sided prism; and the form of its integrant molecules is a triangular prism, whose sides are squares, and bases equilateral triangles. The most common variety of its crystals is the regular six-sided prism, sometimes with the edges of the prism, or of the bases, or the solid angles, or both wanting, and small faces in their place. Crystals short; lateral planes smooth, terminal planes rough; colour emerald green of all intensities; vitreous;

fracture small, imperfect, conchoidal, with a concealed foliated fracture, and fourfold cleavage; fragments sharp-edged; causes double refraction; scratches quartz with difficulty. Specific gravity from 2.600 to 2.7755. Emeralds are divided by jewellers into two classes or kinds, namely, the oriental and the occidental. The former is at present extremely scarce, being found only in the kingdom of Cambay, in India. The occidental emeralds are chiefly imported from Peru, in South America. A very inferior sort is also obtained from Silesia, which, however, is little esteemed. Genuine emeralds being seldom to be met with, several experiments have been made, and directions given for imitating them; from which we select the following: Take of natural crystal of and of red lead, each four ounces; verdigrease 48 grains; and of crocus martis, prepared with vinegar, eight grains. The whole is to be finely pulverized, sifted, and put into a crucible, the space of one inch being left empty. It is then to be well luted, set in a potter's furnace, and left for the same space of time as earthenware. When cool, the crucible is to be broken, and these ingredients will be found converted into a mass of a fine emerald colour; which, after being cut and set in gold, will at least be equal, if not superior, to genuine oriental emeralds. See also **PASTES**.

EMERITI, in Roman antiquity, soldiers who served out their time, and had received marks of favour for their merits.

EMERODS, or **EMEROIDS**, [corrupted by ignorant pronunciation from *hemorrhoids*, *αιμορροειδες*,] painful swellings of the hemorrhoidal veins; piles.

EMERSION, in astronomy, is used when the sun, moon, or other planet, begins to re-appear, after its having been eclipsed, or hid by the interposition of the moon, earth, or other body. The difference of longitude is sometimes found by observing the immersions and emersions of the first of Jupiter's satellites. The immersions are observed from the time of Jupiter's being in conjunction with the sun to his opposition; and the emersion from the opposition to the conjunction; which two intervals are usually six months each, and divide the year between them. But when Jupiter is in conjunction with the sun, and 15 days before and afterwards, there is nothing to be observed; the planet, with his satellites, being then lost in the light of the sun.

EMERSON, in physics, the rising of any solid above the surface of a fluid specifically heavier than itself, into which it had been violently immersed or thrust.

EMERSON, **WILLIAM**, a late eminent mathematician, born in June 1701, at Hurworth, a village about three miles south of Darlington; at least it is certain that he resided here from his childhood. His father Dudley Emerson was a tolerable proficient in mathematics; and without his books and instructions, perhaps his own genius (most eminently fitted for mathematical disquisitions) would have never been unfolded. He was instructed in the learned languages by a young clergyman, then curate of Hurworth, who was boarded at his father's house. In the earlier part of his life he attempted to teach a few scholars; but whether from his concise method (for he was not happy in explaining his ideas), or the warmth of his natural temper, he made no progress in his school; he therefore soon left it off; and, satisfied with a moderate competence left him by his parents, devoted himself to a studious retirement. Towards the close of 1781, he disposed of the whole of his mathematical library to a bookseller at York, and on May 20th 1782, he died of a lingering and painful disorder at his native village, aged 81. In size he was rather short, but strong and well made, with an open countenance and ruddy complexion. He was exceedingly singular in his dress. He had but one coat, which he always wore open before, except the lower button; no waistcoat; his shirt quite the reverse of one in common use, no opening before, but buttoned close at the collar behind; a kind of flaxen wig which had not a crooked hair in it, and probably had never been combed from the time it was made. He always walked up to London when he had any thing to publish, revising sheet by sheet himself: To trust no eyes but his own, was always a favourite maxim with him. He never advanced any mathematical proposition that he had not first tried in practice, constantly making all the different parts himself on a small scale, so that his house was filled with all kinds of mechanical instruments together or disjointed. He would frequently stand up to his middle in water while fishing, a diversion he was remarkably fond of. He used to study incessantly for some time, and then for relaxation take a ramble to any alehouse where he could get any person to drink with

with and talk to. The duke of Manchester was highly pleased with his company, and often came to him in the fields, and accompanied him home, but could never persuade him to get into a carriage. He was married, and his wife used to spin on an old fashioned wheel, whereof a very accurate drawing is given in his mechanics. He was deeply skilled in music, the theory of sounds, and the various scales both ancient and modern, but was a very poor performer. He wrote, 1. The Doctrine of Fluxions: 2. The Projection of the Sphere, orthographic, stereographic, and gnomonical: 3. The Elements of Trigonometry: 4. The Principles of Mechanics: 5. A Treatise of Navigation on the Seas: 6. A Treatise of Algebra, in two books: 7. The Arithmetic of Infinites, and the differential Method, illustrated by examples: 8. Mechanics; or, the Doctrine of Motion: 9. The Elements of Optics, and Perspective: 10. A System of Astronomy: 11. The Laws of Centripetal and Centrifugal Force: 12. The Mathematical Principles of Geography: 13. Tracts, 8vo: 14. Cyclomathesis; or an easy Introduction to the several Branches of Mathematics: 15. A short Comment on Sir Isaac Newton's Principia; to which is added, A Defence of Sir Isaac against the Objections that have been made to several Parts of his Works: And, 16. A Miscellaneous Treatise, containing several Mathematical Subjects, 8vo. 1776.

EMERY, [*smiris*, Lat. *esmeril*, Fr.] an iron ore, considerably rich. It is found in the island of Guernsey, in Tuscany, and many parts of Germany. It has a near relation to the magnet. The lapidaries cut the ordinary gems on their wheels by sprinkling the wetted powder over them; but it will not cut diamonds. It is useful in cleaning and polishing steel. Emery is found in large masses of no determinate shape or size, extremely hard, and very heavy. It is usually of a dusky brownish red on the surface; but when broken, is of a fine bright iron grey, with some tinge of redness; and is spangled all over with shining specks, which are small flakes of a foliaceous talc, highly impregnated with iron. It is also sometimes very red, and then usually contains veins of gold. It makes no effervescence with any of the acid menstrua. Dr. Lewis is of opinion, that some kinds of emery may contain platina. The English are the only people who have the art of reducing emery into powder.

EMESA, or EMESSA, an ancient town of Asia, in Syria, 25 miles S. of Hama. It has several fine ruins, which give some idea of its ancient magnificence.

EMETICS are those medicines which are either given with a view to discharge the foul or poisoned contents of the stomach, or to relax the coats of that organ, and thus to produce certain changes in other parts of the animal economy, not immediately connected with the process of digestion. With the latter intention, small nauseating doses are generally administered, especially in catarrhal and other diseases of the breast. In this place, however, we shall but briefly enumerate the cases in which vomiting may be excited with a probability of success; and also, those instances in which this remedy cannot be safely adopted. Emetics may be of great service: 1. Immediately after swallowing narcotic and other poisons; 2. For the purpose of evacuating viscid, bilious, and putrid matters, or undigested food from the stomach; 3. To assist Nature, when there is a spontaneous effort to vomit; 4. To expel substances fallen into and obstructing the passage of the gullet; 5. To promote the expectoration of mucus and purulent matter, collected in the lungs and windpipe;—as well as on many other occasions. On the contrary, the greatest precaution is required in the following cases, where a precipitate use of emetics may be attended with fatal effects, from bursting a blood-vessel, &c. 1. In all plethoric persons, but especially such as perceive a strong propulsion of the blood to the head, breast, stomach, or liver; 2. In actual inflammation of the intestines; 3. In states of extreme languor and debility; 4. In every species of ruptures, and prolapses; 5. In violent pain proceeding from stones confined in the bilious or urinary passages; 6. In obstructions of the bowels, and other abdominal parts; 7. In persons of very rigid fibres, for instance, the aged and emaciated; 8. In a very weak or affected state of the lungs, liver and stomach; 9. In a deformed structure of the body, or some particular parts; for which reason emetics might prove dangerous to persons troubled with a hump-back, a very short neck, narrow chest, &c.

EMILLEGUE, one of the Pelew islands.

EMIMS, ancient inhabitants of the land of Canaan beyond

Jordan, towards the Dead Sea; who were defeated by Chedorlamer and his allies.

EMINENCE, in geography, a little hillock or ascent above the level of the adjoining campaign.

EMIR, a title of dignity among the Turks, signifying a prince. This title was first given to the caliphs; but when they assumed the title of Sultans, that of emir remained to their children; as that of Cæsar among the Romans. At length the title came to be attributed to all who were descended from Mohammed by his daughter Fatimah, and who wear the green turban instead of the white.

EMISSARY VESSELS, in anatomy, the same with those more commonly called excretory.

EMLY, an ancient city of Ireland, in Tipperary, now in ruins. It is 15 miles W. of Cashel.

EMMA, a river of the Helvetic republic, in the late canton of Bern.

EMMANUEL, [*שמעון*, Heb. *z. e.* God with us,] one of the names of our Saviour. See Isaiah vii. 14.

EMMAUS, EMAUS, or AMMAUS, in ancient geography, a village, 60 stadia N. W. of Jerusalem, or about 7 miles: it afterwards became a town, and a Roman colony, called Nicopolis. Reland mentions a village called Emmaus towards Lydda, 22 miles from Jerusalem; and another, near Tiberias.

EMMAUS, in modern geography, a Moravian settlement in Pennsylvania, 8 miles from Bethlehem.

EMMENAGOGUES, medicines so named from *em*, in, *men*, month, and *agog*, I lead, because they promote the monthly discharge.

EMMERICH, EMMERICK, or EMBRICK, a rich fortified town of Germany, in Westphalia, on the left bank of the Rhine.

EMMET. See FORMICA and TERMES.

EMMIUS, UBBO, a very learned professor, born at Gretha in East Friesland, in 1547, and chosen rector of the college of Norden in 1579. This seminary flourished exceedingly under his care; and declined as visibly after he was ejected, in 1587, for refusing to subscribe the Confession of Augsburg. In 1588, he was made rector of the college of Leer; and when the city of Groningen confederated with the United Provinces, the magistrates appointed him rector of that college: which employment he filled with the highest repute near 20 years. The college being erected into an university, he was the first rector, and one of the chief ornaments of it by his lectures, till his infirmities prevented his public appearance. His wisdom was equal to his learning; so that the governor of Friesland and Groningen often consulted him, and seldom failed to follow his advice. He wrote "Vetus Græcia illustrata," 3 vols.; "Decades Rerum Fresicarum;" and many other valuable works. He died in 1625.

EMOLLIENTS, those medicines which are supposed to soften and relax the fibres of the body, either by mechanically distending such as before were too closely, that is, preternaturally combined; or, by penetrating into the interstices of the elementary fibres, and supplying these particles, from a deficiency of which they were too intimately united. Among the remedies of the former class are chiefly heat, and all unctuous applications; such as lard, wax, fat of venison, &c.: to the latter belong all juicy, mucilaginous, and saccharine substances, serving both as nutriment and medicines. Of this description are the expressed vegetable oils, fresh butter, decoctions of marsh-mallows, infusions of linseed, &c. Emollients are indicated: 1. When the fibres are in too rigid a state; 2. When they are spasmodically contracted; 3. In all active inflammations; and 4. In obstinate costiveness, or accumulations of faeces in the intestines.

EMOLUMENT is properly applied to the profits arising daily from an office or employment. The Latin, *emolumentum*, according to some, primarily signifies the profit redounding to the miller from his mill; from *molo*, *molere*, to grind.

EMOTION, [*emotion*, Fr.] disturbance of mind; vehemence of passion, pleasing or painful.

EMOTION is thus distinguished from Passion, by the late celebrated Lord Kaimes, in his "Elements on Criticism;" vol. i. p. 41. "An internal motion or agitation of the mind, when it passeth away without desire, is denominated an emotion: when desire follows, the motion or agitation is denominated a passion, A fine

A fine face, for example, raiseth in me a pleasant feeling: if that feeling vanish without producing any effect, it is in proper language an emotion; but if the feeling, by reiterated views of the object, becomes sufficiently strong to occasion desire, it loses its name of emotion, and acquires that of passion. The same holds in all the other passions. The painful feeling raised in a spectator by a slight injury done to a stranger, being accompanied with no desire of revenge, is termed an emotion; but that injury raiseth in the stranger a stronger emotion, which being accompanied with desire of revenge, is a passion. External expressions of distress produce in the spectator a painful feeling, which being sometimes so slight as to pass away without any effect, is an emotion; but if the feeling is so strong as to prompt desire of affording relief, it is a passion, and is termed pity. Envy is emulation in excess: if the exaltation of a competitor be barely disagreeable, the painful feeling is an emotion; if it produce desire to depress him, it is a passion." See **PASSION**.

EMOUI, EMOUY, or HIA-MEN, an island and port of China, under the jurisdiction of the province of Fo-kien.

EMPALEMENT, [from *in* and *palus*, Lat. a stake,] an ancient barbarous punishment, which consisted in thrusting a stake up the fundament. It is mentioned by Juvenal. It was often inflicted under Nero, and continues to be so in Turkey.

EMPALEMENT OF A FLOWER, the same with Calyx.

EMPANNEL, [from *panne*, Fr.] the writing or entering the names of a jury into a parchment schedule, or roll of paper, by the sheriff, which he has summoned to appear for the performance of such public service as juries are employed in.—Cowel.

EMPEDOCLES, a celebrated philosopher and poet, born at Agrigentum, in Sicily. He followed the Pythagorean philosophy, and admitted the metempsychosis. He constantly appeared with a crown of gold on his head; to maintain, by this outward pomp, the reputation he had acquired of being a very extraordinary man. Yet Aristotle says, that he was a great lover of liberty, extremely averse to state and command, and that he even refused a kingdom that was offered him. His principal work was a Treatise in verse on the "Nature and Principles of Things." Aristotle, Lucretius, and all the ancients, make the most magnificent eulogiums on his poetry and eloquence. He taught rhetoric; and often alleviated the anxieties of his mind, as well as the pains of his body, with music. It is reported, that his curiosity to visit the flames of the crater of *Ætna* proved fatal to him. Some maintain that he wished it to be believed that he was a god; and that his death might be unknown, he threw himself into the crater and perished in the flames. His expectations, however, were frustrated; and the volcano by throwing up one of his sandals discovered to the world that Empedocles had perished by fire. Others reported that he lived to an extreme old age; and that he was drowned in the sea about B. C. 440.

EMPERESS, or EMPRESS, denotes either the wife of an emperor, or a woman who governs singly an empire, in her own right. See **EMPEROR** and **EMPIRE**.

EMPEROR, [*imperator*,] among the ancient Romans, signified a general of an army, who, for some extraordinary success, had been complimented with this appellation. Thus Augustus, having obtained no less than twenty victories, was as often saluted with the title emperor; and Titus was denominated emperor by his army after the reduction of Jerusalem. Afterwards, it came to denominate an absolute monarch or supreme commander of an empire. In this sense Julius Cæsar was called emperor: the same title descended with the dignity to Octavius, Tiberius, and Caligula; and afterwards it became elective. The title emperor does not, and cannot add anything to the rights of the sovereignty: its effect is only to give precedence and pre-eminence above other sovereigns; and as such, it raises those invested with it to the summit of all human greatness. It is disputed, if emperors have the power of disposing of the regal title. It is true, they have sometimes taken upon them to erect kingdoms. Thus Bohemia and Poland are said to have been raised to that dignity: thus also, the emperor Charles II. in 877, gave Provence to Boson, putting the diadem on his head, and decreeing him to be called king, "ut more priscorum imperatorum regibus videretur dominari."

EMPETRUM, BERRY-BEARING HEATH, a genus of the triandria order, and diœcia class of plants; natural order, Miscellanæ. Male, calyx three-parted; corolla three-petaled; stamens long; female, calyx three-parted; corolla three-petaled; styles

nine; berry nine-seeded. There are two species; viz. *E. album*, white-berried heath, and *E. nigrum*, black-berried heath, crow or crane berry. These are low shrubs, seldom propagated in gardens, unless for variety's sake. They are natives of wild mountains, where the soil is heathy and full of bogs.

EMPHASIS, [*εμφασις*,] a remarkable stress laid upon a word or sentence; particular force impressed by stile or pronunciation. See **DECLAMATION**, **ORATORY**, and **READING**.

EMPHRAXIS, [*εμφραξις*,] an obstruction in any part of the body.

EMPHYSEMA, [*εμφυσημα*,] a windy tumour, generally occasioned by a fracture of the ribs, and formed by the air insinuating itself, by a small wound, between the skin and muscles, into the substance of the cellular or adipose membrane, spreading itself afterwards up to the neck, head, belly, and other parts, much after the manner in which butchers blow up their veal.

EMPHYTEUSIS, [from *ϕυ*, in, and *φυτειν*, to plant, Gr.] the act of planting, or clearing lands for planting; the tenure of lands on that condition.

EMPIRE, [*imperium*,] in political geography, a large extent of land, under the jurisdiction or government of an emperor. See **EMPEROR**. In ancient history we read of four great empires, viz. 1. That of the Assyrians, Chaldeans, and Babylonians; 2. of the Medes and Persians; 3. of the Greeks; and 4. of the Romans. The first subsisted from the time of Nimrod, who founded it A. M. 1800, according to the computation of Ussher, to Sardanapalus their last king, in 3257, and consequently lasted about 1450 years. The empire of the Medes commenced under Arbaces, A. M. 3257; was united to that of the Babylonians and Persians under Cyrus, A. M. 3468, and ended with the death of Darius Codomannus in 3674. The Grecian empire lasted only during the reign of Alexander the Great, beginning in A. M. 3674, and terminating with the death of this conqueror in 3681, when his conquests were divided among his captains. The Roman empire commenced with Julius Cæsar, when he was made perpetual dictator, in A. U. C. 708, A. M. 3956, and A. D. 48. The seat of the empire was removed to Byzantium by Constantine, A. D. 334, and the east and west were still considered as united under the title of the Roman empire though mostly governed by two different series of emperors, till the total overthrow of the latter under Augustulus, by the Goths, A. D. 476. The Western empire was not revived even in name, till the year 800, when Charles the Great, of France, was proclaimed emperor by the Romans. From this epoch the east and west formed two separate empires; that of the east, governed by Greek emperors, commenced A. D. 832; and being gradually weakened, terminated under Constantine Palæologus in 1453. The western empire was afterwards known by the appellation of the empire, or German empire. Antiquaries distinguish between the medals of the upper, and lower or bas, empire. The curious only value those of the upper empire, which commences with Cæsar or Augustus, and ends A. D. 260. The lower empire comprehends near 1200 years, reckoning down to the destruction of Constantinople in 1453. They usually distinguish two ages, or periods of the lower empire: the first beginning where the upper ends, viz. with Aurelian, ending with Anastasius, including 200 years; the second beginning with Anastasius, and ending with the Palæologi, which includes 1000 years.

EMPIRIC, [*εμπειρικος*,] a trier; an experimenter; such persons as have no true education in, or knowledge of, physical practice, but venture upon hearsay and observation only.—Quincy.

EMPIS, in zoology, a genus of the class and order insectæ diptera. Proboscis horny, bivalve, reflexed under the head and breast, and longer than the thorax. They live by sucking the blood and juices of other animals, and inhabit fields and gardens. There are about 30 species.

EMPLASTIC, [*εμπλαστικος*, or *εμπλαςτος*,] medicines which conspicate and shut up the pores of the body.

EMPLEURUM, in botany, a genus of the monœcia tetrandria class and order. Male calyx four-cleft; corolla none; female calyx four-cleft, inferior; corolla none; stigma cylindric; capsule opening at the side; seed one, arilled. There is one species, a shrub of the Cape.

EMPNEUMATOSIS, [*εμπνευματωσις*, Gr.] the alternate dilatation of the chest, by which the air is inhaled and communicated to the blood.

EMPOLI, a town of Italy, in Tuscany, 17 miles S. W. of Florence. Lon. 11. 6. E. Lat. 43. 42. N.

EMPONEMA, [from *εμπονω*, Gr. to labour,] the art of improving ground by labour.

EMPORIÆ, a double city of the Hither Spain, near the Pyrenæes; separated by a wall. It is now called Ampurias.

EMPORIUM, [*εμποριον*,] a place of merchandise; a mart; a town of trade; a commercial city.

EMPORIUM, in ancient geography, the name of two cities in Italy, near Placentia. They are now thought to be Ponte Nura, in Placentia.

EMPORIUM, in medicine, is often used for the common sensory in the brain.

EMPYEMA, [*εμπτυημα*,] a collection of purulent matter in any part whatsoever; generally used to signify that in the cavity of the breast only, and which sometimes happens upon the opening of abscesses, or ulcerations of the lungs, or membranes inclosing the breast.—Quincy. See **MEDICINE**.

EMPYREAL AIR, the name given by Dr. Higgins to that which Dr. Priestley calls dephlogisticated air; other philosophers vital or pure air, and modern chemists oxygen gas.

EMPYREUM, a term used by divines for the highest heaven, where the blessed enjoy the beatific vision. The word is formed of *εμ* and *πυρ*, fire, because of its splendor.

EMPYREUM, or **EMPYREUMA**, [*εμπτεινμα*,] the burning of any matter in boiling or distillation, which gives a particular offensive smell.—Quincy.

EMULATION, a generous ardour kindled by the praise-worthy examples of others, which impels us to imitate, to rival, and, if possible, to excel them. This passion involves it in esteem of the person whose attainments or conduct we emulate, of the qualities and actions in which we emulate him, and a desire of resemblance, together with a joy springing from the hope of success. The word comes originally from the Greek *αμιλλα*, contest; whence the Latin, *amulus*, and thence our *emulation*. Plato makes emulation the daughter of envy; if so, there is a great difference between the mother, and the offspring; the one being a virtue, and the other a vice. Emulation admires great actions, and strives to imitate them; envy refuses them the praises that are their due; emulation is generous, and only thinks of equalling or surpassing a rival; envy is low, and only seeks to lessen him. It would, therefore, be more proper to suppose emulation the daughter of admiration: admiration being a principal ingredient in the composition of it.

EMULGENT, [*emulgens*, Lat.] in anatomy, two large arteries and veins which arise, the former from the descending trunk of the aorta, or great artery; the latter from the vena cava. They are both inserted into the kidneys; the emulgent arteries carrying blood with the serum to them, and the emulgent veins bringing it back again, after the serum has been separated therefrom by the kidneys. See **ANATOMY**.

EMULSION, [*emulsio*, Lat.] a form of medicine resembling milk, and which is often prescribed with a view to sheath and neutralise acrid humours, especially in heat of urine and stranguries, as well as for nervous and irritable habits in general. Emulsions are frequently made, by boiling the oily and farinaceous seeds contained in kernels; in which case they are soon decomposed, on standing. See **PHARMACY**.

EMUNCTORIES, in anatomy, are chiefly the kidneys, bladder, and most of the glands.

EMUNGS, one of the Pelew islands.

ENALLAGE, [*εναλλαγη*,] a figure in grammar, whereby some change is made of the common modes of speech, as when one mood or tense of a verb is put for another.

ENALLAGE, is also used when one word is put for another of the same part of speech: a substantive for an adjective; as *exercitus victor*, for *victoriosus*; *scelus*, for *seclustus*: a primitive for a derivative; as *Dardana arma*, for *Dardania*: an active for a passive; as *nox humida celo præcipitat*, for *præcipitatur*, &c.

ENALURON, in heraldry, according to Guillim, is a bordure charged with birds; though others will have it to signify, in orle, or form of a bordure.

ENAMEL, in general, signifies a vitrified matter, interspersed with some solid substance; and possessing all the properties of glass, excepting that of transparency. The basis of enamel is a pure crystal glass or frit, ground together with a fine calx of lead and tin, prepared for that purpose, with the addition of a small

proportion of the white salt of tartar. These form the principal ingredients of all enamels, which are made by adding various pulverized colours, and thoroughly incorporating the whole in a furnace. For white enamel, it is sufficient to add manganese to the matter which constitutes the basis; for azure, zaffre mixed with calx of brass; for green, calx of brass with scales of iron, or crocus martis; for black, zaffre, with manganese or crocus martis, or manganese with tartar; for red, manganese, or calx of copper with red tartar; for purple, manganese with calx of brass; for yellow, tartar and manganese; lastly, for violet coloured enamel, manganese with brass, that has been three times calcined. Enamels are used either for the counterfeiting or imitating of precious stones, and for painting; or by enamellers and artists working in gold, silver, and other metals. That species of enamel which jewellers employ, is imported from Holland, or Venice, in small cakes of various sizes, which are in general about four inches in diameter, and have the mark of the maker indented on them. It pays a duty of 3s. 8d. per pound on importation; and is allowed a drawback of 1s. 6d. per pound, on being again exported.

ENAMELLING, is the art of laying enamel upon metals, such as gold, silver, copper, &c. whether plain or painted. The latter process is performed on plates of gold or silver, but generally on those of copper, prepared with the white enamel; on which certain objects are delineated with the colours, and afterwards burnt in the fire, where they acquire a brightness and lustre resembling glass. Painting in enamel is held in greater estimation than any other branch of that art; on account of its peculiar and permanent vivacity, the strength of its colours not being effaced by time, but always retaining their pristine splendor. It is chiefly employed in miniature, as it cannot be easily performed on a large scale; the enamel being very liable to crack on a plain surface, so that even the smallest plates must be somewhat of a convex form.

ENANGIOMONOSPERMOUS, [from *εν* in, *αγγιον*, a vessel, *μονος*, alone, and *σπερμα*, a seed,] in botany, having but one seed in the vessel.

ENAREA, a province of Abyssinia, conquered by the troops of Negus, at the beginning of the 17th century, situated at the S. W. extremity of the empire.

ENARGEÆ, in botany, a genus of the hexandria monogynia class and order. No calyx; petals six, oblong, ovate, concave, acute, three outer, three inner, green-spotted; berry three-celled, with four or five globular seeds. It has one species, viz. *E. marginata*, a native of Terra del Fuego.

ENARTHROSIS, [*εν* and *αρθρον*,] in anatomy, the insertion of one bone into another, to form a joint. It is a species of diarthrosis. See **ANATOMY**.

ENCÆNIA, [*εγκανια*, Gr.] the name of three feasts celebrated by the Jews, in memory of the dedication, or rather purification, of the temple, by Judas Maccabæus, Solomon, and Zerobabel. The term is likewise used in church history for the dedication of Christian churches.

ENCALYPTA, in botany, a genus of the cryptogamia musci class and order. Capsule cylindrical; fringe simple, of sixteen linear erect distinct teeth; veil campanulate, inflated, lax. There are six species.

ENCANTHIS, in surgery, a tubercle arising either from the caruncula lachrymalis, or from the adjacent red skin; sometimes so large as to obstruct not only the puncta lachrymalia, but also part of the sight, or pupil itself. See **SURGERY**.

ENCARPIA, [*ενκαρπια*, Gr.] in architecture, flower-work, or fruit-work, on the corners of pillars.

ENCAUMA, [*ενκαυμα*, Gr.] a burning in any part of the body: a hot ulcer.

ENCAUSTES, [from *εν* in, and *καωω*, to burn, Gr.] an enameller.

ENCAUSTIC, [*ενκαυστικη*, Gr.] belonging to enamelling, or painting by fire.

ENCAUSTIC PAINTING, a method of painting made use of by the ancients, in which wax was employed to give a gloss to their colours, and to preserve them from the injuries of the air.

ENCEINTE, [Fr.] in fortification, the wall or rampart which surrounds a place, sometimes composed of bastions or curtains, either faced or lined with brick or stone, or only made of earth. It is sometimes only flanked by round or square towers, which is called a Roman wall.

ENCELADUS, in ancient mythology, the son of Titan and Terra;

Terra; the largest and last of the giants who conspired against Jupiter.

ENCEPHALI, [*εν*, and *κεφαλη*,] in medicine, worms generated in the head, where they cause so great a pain as sometimes to occasion distraction. The encephali are very rare; but there are some diseases wherein they swarm; from whence we are told pestilential fevers have wholly arisen. Upon the dissection of one who died of this fever, a little, short, red, worm, was found in the head, which malmsey wine, wherein horse-radish had been boiled, could alone destroy. This medicine was afterwards tried on the sick, most of whom it cured. The same species of worms have also been taken out by trepanning, and the patient cured. Worms that generate in the nose, ears, and teeth, are also called encephali.

ENCEPPE, in heraldry, denotes fettered, chained, or girt, about the middle, as is usual with monkeys.

ENCHANTER'S NIGHTSHADE, in botany. See **CIRCEÆA**.

ENCHARAXIS, [*εγχαραις*, Gr.] in surgery, the act of lancing or scarifying.

ENCHASING, INCHASING, or CHASING, the art of enriching and beautifying gold, silver, and other metal work, by some design or figures represented thereon in low relieve. Enchasing is practised only on hollow thin works, as silver punch-bowls, tea-pots, coffee-pots, gold or silver watch-cases, cane-heads, tweezer-cases, and the like. It is performed by punching or driving out the metal, to form a figure, from within, so as to stand out prominent from the plane or surface of the metal. In order to this, they provide a number of fine steel blocks or punches of divers sizes; and the design being drawn on the surface of the metal, they apply the inside upon the heads or tops of these blocks, directly under the lines or parts of the figures; then, with a small hammer, striking on the metal, sustained by the block, the metal yields, and the block makes an indention or cavity on the inside, corresponding to which there is a prominence on the outside, which is to stand for that part of the figure. Thus the enchanter proceeds to finish all the parts by the successive application of the block and hammer to the several parts of the design. By this simple piece of mechanism, the artists represent foliage, grotesques, animals, histories, &c. with the most striking propriety and beauty.

ENCHELIS, in natural history, a genus of the vermes infusoria. Worm invisible to the naked eye, very simple, cylindrical. There are fifteen species. Most of them are described in Adam's Treatise on the Microscope.

ENCHUYSEN, or ENCKHUYSEN, a town of Batavia, in the department of the Texel, and late province of N. Holland. It is 10 miles N. E. of Hoorne, and 28 miles of Amsterdam. Lat. 52° 42' N. Lon. 5° 10' E.

ENCHYMOMA, or ENCHYMOSIS, in physiology, a sudden flow of the blood, occasioned by any passion, such as anger, joy, a sense of shame, or the like. It is also used for that flow of the blood which occasions a continued blush.

ENCLAVE, in heraldry, denotes that one thing is let into another, especially when the piece, so let in, is square.

ENCLITICS, or ENCLITICA, [*ενκλιτικα*,] in grammar, particles which are so closely united with other words as to seem part of them, as in *virumque*, &c. There are three enclitic particles in Latin, viz. *que*, *ne*, *ve*: but there are a great many in the Greek, as *τι*, *τε*, *και*, *μοι*, *σι*, *σοι*, &c.

ENCOLPATE, [*εγκολπητικη*, Gr.] in antiquity, the art of making brass plates, and engraving inscriptions and laws on them.

ENCRATITE, or ENCRATITES, in church history, heretics who appeared towards the end of the second century: they were called Encratites, or Continents, because they gloried in abstaining from marriage, and the use of wine and animal food.

ENCROACHMENT, in law, an unlawful gaining upon the rights or possessions of another. It is generally applied to the unlawful occupation of wastes and commons.

ENCYCLOPEDIA, [*εγκυκλοπαιδια*,] the circle of sciences; the round of learning; a term nearly synonymous with Cyclopædia. The late learned printer, Mr. Bower, justly observes, that the preposition *in* makes the meaning of the word more precise: for Cyclopædia may denote "the instruction of a circle," as Cycropædia is "the instruction of Cyrus," whereas in Encyclopædia the preposition determines the word to be from the dative of *cyclos*, "instruction in a circle." And Vossius in his book *De Vi-*

tis Sermonis, has observed "that Cyclopædia is used by some authors, but Encyclopædia by the best." Avicenna, the celebrated Arabian physician, appears to have had the merit of being the first who compiled an Encyclopædia.

END FOR END, in the sea-language, is said of a rope that has run quite out of the block, wherein it was reeved.

ENDEAVOUR. Where one endeavours actually to commit felony, &c. he is punishable as for a misdemeanor; and an assault, with intent to rob, is punished by transportation. Stat. 7. Geo. II. c. 21.

ENDEAVOUR RIVER, a river on the N. E. coast of New Holland, with a bar at its mouth, and not depth of water for vessels to sail more than a mile above the bar. Lon. 145. 12. E. Lat. 15. 27. S.

ENDEAVOUR STRAIT, a narrow sea, between New Guinea, and New Holland.

ENDECAGON, [from *ενδεκα*, eleven, and *γωνια*, an angle,] in geometry, is a plain figure, consisting of eleven sides, and as many angles.

ENDEIXIS, [*ενδειξις*, Gr.] in medicine, an indication of the method of cure.

ENDEMIAL, ENDEMIICAL, or ENDEMIC, [*ενδημιος*,] peculiar to a country; used of any disease, proceeding from some cause peculiar to the country where it reigns: such as the scurvy to the northern climes. Quincy.

ENDICTMENT, or ENDITEMENT, a bill or declaration made in form of law, for the benefit of the commonwealth; or an accusation for some offence exhibited unto jurors, and by their verdict found to be true, before an officer can have power to punish the same offence.—*Cowel*.

ENDIVE, or SUCCORY. See **CICHORIUM**.

ENDKIOPING, a small town of Sweden, in Upland, 40 miles W. of Stockholm.

ENDLESS SCREW. See **SCREW**, and **MECHANICS**.

ENDORSE, in heraldry, an ordinary, containing the eighth part of a pale, which Leigh says is only used when a pale is between two of them.

ENDORSED, in heraldry, is said of things borne back to back, more usually called *adosse*.

ENDORSEMENT. See **INDORSEMENT**.

ENDOWMENT, in law is the widow's portion; being a third part of all the freehold lands and tenements, of which her husband was seized at any time during the coverture. Of lands not freehold, her portion varies according to the custom in different places.

ENDYMION, in fabulous history, a shepherd, son of Æthlius and Calyce. It is said that he required of Jupiter to grant to him to be always young, and to sleep as much as he would; whence came the proverb of Endymionis somnum dormire, to express a long sleep. Diana saw him naked as he slept on mount Latmos; and was so struck with his beauty, that she came down from heaven every night to enjoy his company. Endymion married Chromia, daughter of Itonus; by whom he had three sons, Pæon, Epeus, and Æolus, and a daughter called Eurydice. The fable of Endymion's amours with Diana, or the moon, arose from his knowledge of astronomy; and as he passed the night on some high mountain to observe the heavenly bodies, it came to be reported that he was courted by the moon. Some suppose that there were two of that name; the son of a king of Elis, and the shepherd, or astronomer, of Caria. The people of Heraclea maintained that Endymion died on mount Latmos, and the Eleans pretended to shew his tomb at Olympia, in Peloponnesus.

ENEMY, in law, an alien or foreigner, who in a public capacity invades any country, and who cannot be punished as a traitor, but must be subjected to martial law. An alien-residing here, under the protection of the king's peace, may be dealt with as a traitor, because he owes a qualified allegiance.

ENERGY, [*ενεργεια*,] a term signifying the power, virtue, or efficacy of a thing. It is also used, figuratively, to denote emphasis of speech.

ENERGUMENS, in church history, persons supposed to be possessed by the devil, concerning whom there were many regulations among the primitive Christians. They were denied baptism and the eucharist, in some churches; but though they were under the care of exorcists, they were allowed the public prayers of the church, and were permitted to be present.

ENERVATION,

ENERVATION, is the act of destroying the force, use, or office, of the nerves, either by cutting them, by weakening them with debauchery, or by some other violence. Excess of wine, and other strong, hot, spirituous liquors, enervate, or weaken the nerves. Too great abstinence has the same effect. A moderate use of these and other stimuli strengthen them.

ENFIELD, a town of Connecticut, in Hartford county, 17 miles N. of Harford.

ENFILADE, in the art of war, is used in speaking of trenches, or other places, which may be scoured by the enemy's shot along their whole length. In conducting the approaches at a siege, care must be taken that the trenches be not enfiladed from any work of the place. See **FORTIFICATION**.

ENFINE, formerly **ANTINOË**; a city of Egypt, built by Adrian, in honour of his infamous favourite Antinous. It is situated towards the middle of Upper Egypt, and still contains several stately monuments of antiquity. It was anciently very magnificent.

ENFRANCHISEMENT, in law, the incorporating of a person into any society, or body politic; thus, where any person is enfranchised, or made free, of any city, borough, or company, he is said to have a freehold therein during life; and cannot, for barely endeavouring any thing against the corporation, forfeit the same. Naturalization is also another kind of enfranchisement.

ENGADINA, a territory of the republic of the Grisons among the Alps; extending along the banks of the river Inn, from its source to the Tirolese. It is divided into the Upper and Lower.

ENGANNO, or **DECEIT ISLAND**, an island in the eastern sea, a little distant from the S. W. coast of Sumatra.

ENGANNO TROMPEUR, or **FALSE CAPE**, the easternmost land of Hispaniola, 16½ miles N. of Point L'Épée.

ENGASTRIMYTHI, in Pagan theology, the Pythians, or priestesses of Apollo, who delivered oracles from within, without any action of the mouth or lips. The ancient philosophers, &c. are divided upon the subject of the engastrimythi. Hippocrates mentions it as a disease; others will have it a kind of divination; others attribute it to the possession of an evil spirit; and others to art and mechanism.

ENGELHOLM, a sea-port of Sweden, E. of the Categat, 45 miles W. of Christianstadt.

ENGER, or **ENGERS**, a county of Germany, in the late circle of the Lower Rhine, and electorate of Treves.

ENGERS, the capital of the above county, 11 miles N. of Coblenz. Lon. 7. 32. E. Lat. 50. 35. N.

ENGHEIM, **ENGHIEN**, or **ENGHUIN**, a town of France, in the department of Jemappes, and late province of Austrian Hainault, 15 miles S. W. of Brussels.

ENGIA, **EGINA**, or **EYINA**, an island of European Turkey, in a gulf so named, near the coast of the Morea; anciently called Oenone, Egina, and Myrmdonia. Many fine relics of antiquity are still to be seen on it.

ENGIA, or **ENGINA**, the capital of the above island, 25 miles S. S. W. of Athens. Lon. 23. 59. E. Lat. 37. 42. N.

ENGINE, in mechanics, is a compound machine, made of one, or more, mechanical powers, as levers, pullies, screws, &c. in order to raise, cast, or sustain any weight, or produce any effect which could not be easily effected otherwise. The word is formed of the French *engin*, from the Latin *ingenium*, wit; from the ingenuity exerted in the invention of engines to augment the effect of moving powers. Engines are extremely numerous; some used in war, as the battering-ram, ballista, waggons, chariots, &c. others in trade and manufactures, as cranes, mills, presses, &c. others to measure time, as clocks, watches, &c. and others for the illustration of some branch of science, as the orrery, cometarium, and the like. See **BATTERING-RAM**, **BALLISTA**, &c. In general we may observe, concerning engines, that they consist of one, two, or more, of the simple powers variously combined together; that in most of them the axis in peritrochio, the lever, and the screw, are the constituent parts; that in all a certain power is applied to produce an effect of much greater moment; and that the greatest effect, or perfection, is when it is set to work with four-ninths of that charge which is equivalent to the power, or will but just keep the machine in equilibrio. See **MECHANICS**.

ENGINE FOR EXTINGUISHING FIRES. See **HYDROSTATICS**.

ENGINE, PILE, one contrived for driving piles. See **PILE ENGINE**, and **MECHANICS**.

ENGINE, STEAM, a machine to raise water by the force of steam. See **STEAM-ENGINE**.

ENGINEER, [*enginier*, Fr.] one who manages engines; one who directs the artillery of an army.

ENGINEER, in the art of war, is commonly applied to an officer, whose business is to inspect and contrive attacks, defences, &c. of a fortified place. He should be possessed of a perfect knowledge in mathematics, so as to delineate upon paper, or mark upon the ground, all sorts of forts, and other works proper for offence and defence. He should also understand the art of fortification, so as not only to be able to discover the defects of a place, but to find a remedy proper for them; as also how to make an attack upon, as well as to defend, the place. Engineers should, therefore, be brave as well as ingenious. When at a siege they have narrowly surveyed the place, they are to make their report to the general, by acquainting him which part they judge the weakest, and where approaches may be made with most success. Their business is also to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, and lodgements, taking care that none of their works be flanked, or discovered from the place.

ENGLAND, the southern and largest division of Great Britain. Including Wales, it is of a triangular form, and lies between Lon. 2° E. and 7° W. and between Lat. 49° and 56° N. extending about 400 miles in length from S. to N. and 300 on an average in breadth. From the S. Foreland in Kent, which may be termed the E. point of the triangle to Berwick on Tweed, which is the N. its length, in a straight line, is 345 miles; from Berwick to the Lands end in Cornwall, which is its W. it is 425, and from thence to the S. Foreland, it is 340 miles. It is bounded by Scotland on the N. by the English Channel on the S. which separates it from France; by the German Sea on the E. and N. E. by St. George's or the Irish Channel, on the W. At what time the island of Britain was first peopled is uncertain; nor do we know whether the southern or northern parts were first inhabited. We have no accounts that can be depended upon before the arrival of Julius Cæsar, and it is certain he found the southern parts full of people of a very warlike disposition. These people, according to Cæsar, were a colony of the Gauls; and this opinion is embraced by most of the ancient as well as modern writers. It is chiefly founded on the agreement observed by the Romans between the two nations in their customs, manners, language, religion, government, way of fighting, &c. The more northern inhabitants, according to Tacitus, came from Germany. This he infers from the make of their limbs; but Cæsar simply calls them Aborigenes. The Britons, according to the Roman historians, were very numerous, at the time of Cæsar's invasion, and had their country well stocked with cattle. Their houses resembled those of the Gauls; and they used copper or iron plates weighed by a certain standard instead of money. Their towns were a confused parcel of huts placed at a small distance from one another, generally in the middle of a wood, to which all the avenues were slightly guarded with ramparts of earth, or with trees. All the nations were in a state of the most wretched barbarism, even when compared with the barbarous Gauls on the continent. The use of clothes was scarce known in the island. Only the inhabitants of the southern coast covered their nakedness with the skins of wild beasts; and this rather to avoid giving offence to the strangers who came to trade with them, than out of any principle of decency. It was a general custom among the Britons to paint their bodies with the juice of woad. They shaved their beards, all except their upper lip, and wore long hair. They are also said to have had their wives in common; but this is denied by judicious antiquaries, who think it either a slander or a mistake of the Roman conquerors, who being themselves addicted to the most beastly vices, thought it impossible for several families to live together without having their women in common. The arms of the Britons were a sword, a sharp lance, and a shield. Breast-plates and helmets they considered as incumbrances. They usually fought in chariots, some of which were armed with scythes in the wheels; they were fierce and cruel, and exceedingly bloodthirsty. When driven to distress, they could subsist even on the bark and roots of trees; and Dion Cassius tells us, that they had ready, on all occasions, a certain kind of food, of which, if they took but the quantity of a bean, they were not troubled with hunger

or thirst for a long time after. The southern nations were more civilized; and the Cantii, more so than any of the rest. England, including Wales, when first invaded by the Romans, was divided into 17 petty states. 1. The Damnonii, Dunmonii, or Donmonii, inhabited Cornwall and Devonshire. 2. The Durotriges possessed Dorsetshire. 3. The Beldæ Somersetshire, Wiltshire, and the greater part of Hampshire. 4. The Atrebatæ inhabited Berkshire. 5. The Regni inhabited Surrey, Sussex and part of the coast of Hampshire. 6. The Cantii inhabited and gave name to Kent. 7. The Dobuni are placed by Ptolemy on the N. side of the Thames, near its head, in Gloucestershire and Oxfordshire. 8. The Catticudani, Cattidudania, or Cathicudani, inhabited Buckinghamshire, Bedfordshire, and Hertfordshire. 9. The Trinobantes possessed Essex and Middlesex. 10. The Iceni, whose country comprehended Suffolk, Norfolk, Cambridge, and Huntingdonshire, are by Ptolemy called Simeni, and by others Tigeni. Camden is of opinion, that they were the people whom Cæsar calls Cenomagni. 11. The Coritani inhabited Northamptonshire, Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire. 12. The Cornavii possessed Warwickshire, Worcestershire, Staffordshire, Shropshire, and Cheshire. 13. The Silures inhabited Radnorshire, Brecknockshire, Glamorganshire, Herefordshire, and Monmouthshire. 14. The Demetæ inhabited part of Caermarthenshire, Pembrokeshire, and Cardiganshire. 15. The country of the Ordovices comprehended Montgomeryshire, Merionethshire, Caernarvonshire, Denbighshire, and Flintshire. 16. The Brigantes possessed Yorkshire, Durham, Lancashire, Westmoreland, and Cumberland. 17. Northumberland was held by the Ottadini, Ottadeni, or Ottalini. Their country, according to some, reached from the Tyne to the Forth; though the most common opinion is, that it reached only to the Tweed. The above names are plainly Roman, but their etymology is doubtless British, though any attempts to trace their derivation from words in the old British language, must now be attended with great uncertainty and obscurity. Dr. Aikin, in his *England Delineated*, observes, that, "with respect to climate, England is situated in the N. part of the temperate zone, so that it enjoys but a scanty share of the genial influence of the sun. Its atmosphere is inclined to chillness and moisture, subject to frequent and sudden changes; and is more favourable to the growth, than to the ripening, of the products of the earth. No country is clothed with so beautiful and lasting a verdure; but the harvests, especially in the northern parts, frequently suffer from unseasonable rains; and the fruits often fall short of their perfect maturity. The rigours of winter, however, as well as the parching heats of summer, are felt here in a much less degree than in parallel climates on the continent; a circumstance common to all islands. While the sea-ports of Holland and Germany are, every winter, locked up with ice, those of England, and even Scotland, are never known to suffer this inconvenience. The western side of the kingdom, receiving first the great clouds from the Atlantic Ocean, which are afterwards intercepted in their passage by the middle ridge of hills, is considerably more exposed to rain than the eastern; but the latter is more frequently involved in fogs and mists. The whole country, some particular spots excepted, is sufficiently healthy; and the natural longevity of its inhabitants is equal to that of almost any region." The British constitution, is a limited monarchy, or a government by the united powers of king, lords, and commons. It has long been justly celebrated as uniting the advantages and avoiding the inconveniences of absolute monarchy, aristocracy, and democracy. It originated among the Anglo-Saxons, and was brought to a high degree of perfection by the patriotic monarch, Alfred the Great. It was afterwards considerably infringed upon by William the Conqueror and his successors, but was restored by the Magna Charta; and after repeated encroachments by different monarchs, was finally ameliorated, established, and confirmed, by the glorious revolution in 1688. The executive power is vested in the king, and in the ministers, judges, juries, and other gradations of magistracy under him. The legislative authority is entrusted to the two houses of parliament. See COMMONS, KING, LAW, LIBERTY, LORDS, MAGNA CHARTA, PARLIAMENT, PEERS, RIGHTS, &c. Since the reign of Henry VIII. the sovereign of England has been called, in public writs, the supreme head of the church; but this title conveys no spiritual meaning, as it only denotes the regal power to prevent any ecclesiastical differences, or in other words,

substitutes the king in place of the pope, with regard to temporalities and the internal economy of the church. The kings of England never intermeddle in ecclesiastical disputes. They only give a sanction to the legal rights of the clergy. The church of England, under this description of the monarchical power, is governed by two archbishops, and 24 bishops, besides the bishop of Sodor and Man, who, not being possessed of an English barony, does not sit in the house of peers. See ARCHBISHOP and BISHOP. England contains about 60 archdeacons. Subordinate to them are the rural deacons, formerly styled archpresbyters, who signify the bishop's pleasure to his clergy, the lower class of which consists of rectors or vicars, deacons, and curates. See CURATE, DEACON, PARSON, and VICAR. The ecclesiastical government of England is, properly speaking, lodged in the convocation; which is a national representation or synod, and answers pretty near to the idea of a parliament. They are convoked at the same time with every parliament; and their business is to consider the state of the church, and to call those to an account who have advanced new opinions, inconsistent with the doctrines of the church of England. Some zealous clergymen during the reign of queen Anne, and in the beginning of that of George I. raised the powers of the convocation to a height that was inconsistent with the principles of religious toleration, and indeed of civil liberty: so that the crown was obliged to exert its prerogative of calling the members together, and of dissolving them; and ever since they have not been permitted to sit for any time, in which they could do business. Since the Norman conquest, England has been divided into six circuits, each containing a certain number of counties: which are subdivided into wapentakes, or hundreds, and parishes. Two judges are appointed for each circuit, which they visit in the spring and autumn, for administering justice to subjects at a distance from the capital. In holding the lent (or spring) assizes, the northern circuit extends only to York and Lancaster; the assizes at Durham, Newcastle, Carlisle, and Appleby, being held only in the autumn, and distinguished by the appellation of the long circuit. These circuits and counties are as follow: 1. The Home Circuit contains the counties of Essex, Hertford, Kent, Surry, and Sussex. 2. Norfolk Circuit contains those of Bucks, Bedford, Huntingdon, Cambridge, Suffolk, and Norfolk. 3. Oxford Circuit, Oxon, Berks, Gloucester, Worcester, Monmouth, Hereford, Salop, and Stafford. 4. Midland Circuit, Warwick, Leicester, Derby, Nottingham, Lincoln, Rutland, and Northampton. 5. Western Circuit, Hants, Wilts, Dorset, Somerset, Devon, and Cornwall. 6. Northern Circuit, York, Durham, Northumberland, Lancaster, Westmoreland, and Cumberland. Middlesex and Cheshire are not comprehended in any circuit; the former being the seat of the supreme courts of justice, and the latter a county palatine. Besides the 40 counties into which England is divided, there are counties corporate, consisting of certain districts, to which the liberties and jurisdictions peculiar to a county have been granted by royal charter. Thus the city of London is a county distinct from Middlesex; the cities of York, Chester, Bristol, Norwich, Worcester, and the towns of Kingston-upon-Hull, and Newcastle-upon-Tyne, are counties of themselves, distinct from those in which they lie. The same may be said of Berwick upon Tweed, which has within its jurisdiction a small territory of two miles on the N. side of the river; and which, though it lies in Scotland, is considered in law, as distinct from both kingdoms. For particulars respecting the polity, trade, law, civil and religious antiquities, &c. of England. See PARLIAMENT, PRIVY COUNCIL, COURT, CUSTOM-HOUSE, ADMIRALTY, &c. The lakes of England are chiefly in the N. W. counties; and those of Westmoreland and Cumberland, in particular, exhibit such varieties of beautifully romantic and picturesque scenery, as to have become, for some years past, the fashionable object of summer excursions from the metropolis. The chief mountains in England are the hills of Westmoreland, the Malvern Hills in Worcester, the Peak of Derby, Snowdon, and Plinlimmon. The inhabitants of England and Wales are computed at eight millions. The chief ports of the navy are, Portsmouth, Plymouth, Deptford, and Chatham. All the most valuable productions, both animal and vegetable, of this country, have been imported from the continent. Originally nuts, acorns, crabs, and a few wild berries, were almost all the variety of vegetable food which our woods could boast. To foreign countries, and to the efforts of culture,

we are indebted for bread, the roots and greens of our tables, and all our garden fruits. The barley and hops of our malt liquors, and apples for cider, are equally the gifts of other lands. The meanest labourer is now fed with more wholesome and delicate aliments, than the ancient petty kings of the country could obtain in its savage and uncultivated state. Originally this great island seems to have been like the wilds of America, almost entirely overrun with wood. Here formerly roamed the bear, the wolf, and the wild boar, now totally extirpated. Large herds of stags ranged through the woods, roe-bucks bounded over the hills, and wild bulls grazed in the marshy pastures. By degrees the woods were destroyed, to make way for cultivation; the marshes were drained; and the wild animals invaded in their retreats, gradually disappeared. England now possesses no other wild beasts but the fox, the wild cat, the badger, the martin, and others of the weasel kind; the otter, the hedge-hog, the hare and rabbit; the squirrel, dormouse, mole, &c. and several other species of the rat and mouse. On the other hand, every kind of domestic animal, imported from abroad, has been reared to the greatest degree of perfection. The horse has been trained up so as to excel in strength and swiftness the same animal in every other country. The horned cattle have been brought to the largest size and greatest justness of shape. The different races of sheep, in England, are variously distinguished, either for uncommon size, goodness of flesh, and plenty or fineness of wool. The rivers are numerous; but the comparatively small extent of England will not allow them to vie, in length of course, with the great rivers on the continent. The most considerable of them are the Thames, Severn, Medway, Trent, Ouse, Tyne, Tees, Eden, Avon, Derwent, Dee, Mersey, &c. which, with many others, will be found described under their respective heads. The rivers and seas of England are stocked with a great variety of fish, which yield a plentiful article of provision to all ranks of people. The river fish, from the populousness of the country, and the number of fishers, are, in many parts much diminished. But the sea is an inexhaustible source; and the whole sea-coast is enlivened by numerous inhabitants, who gain their chief subsistence from it. "The face of the country in England," says Dr. Aikin, in his *England Delineated*, "affords all that beautiful variety which can be found in the most extensive tracts of the globe. In some parts, verdant plains extend as far as the eye can reach, watered by copious streams, and covered by innumerable cattle. In others, the pleasing vicissitudes of gently rising hills and bending vales, fertile in corn, waving with wood, and interspersed with meadows, offer the most delightful landscapes of rural opulence and beauty. Some tracts abound with prospects of a more romantic kind; lofty mountains, craggy rocks, deep narrow dells, and rumbling torrents. Nor are there wanting, as a contrast to so many agreeable scenes, the gloomy features of black barren moors and wild uncultivated heaths. On the whole, however, few countries have a smaller proportion of land absolutely sterile and incapable of culture." The richest parts are, in general, the middle and southern. Towards the N. it is less fertile. The E. coast is, in many parts, sandy and marshy. A range of rude and elevated land, sometimes rising into lofty mountains, extends from the borders of Scotland to the very heart of England, running from N. to S. and forming a natural division between the E. and W. sides of the kingdom. Cornwall is also a rough hilly tract, as well as part of the adjacent counties. The established religion of England is the Reformed or Protestant, and its doctrines are contained in the 39 Articles. The liturgy, and homilies are evidently formed according to the Lutheran rather than the rigid Calvinistic doctrines. Toleration in matters of religion is allowed to all the inhabitants, so that every one is at liberty to worship God, according to the dictates of his own conscience.

ENGLAND NEW. See NEW ENGLAND.

ENGLECHERIE, ENGLISHIRE, or ENGLISHERY, an ancient word signifying the being an Englishman, which was used in the time of king Canutus, to distinguish the English from the Danes, especially in the case of murder, and its punishment.

ENGLISH, or the ENGLISH-TONGUE, the language spoken by the people of England, and, with some variation, by those of Scotland, as well as part of Ireland, and the rest of the British dominions. "Though," says Dr. Johnson, the Britons or Welsh were the first possessors of this island, whose names are recorded, and are therefore in civil history always considered as the

predecessors of the present inhabitants; yet the deduction of the English language, from the earliest times of which we have any knowledge to its present state, requires no mention of them: for we have so few words which can, with any probability, be referred to British roots, that we justly regard the Saxons and Welsh as nations totally distinct. It has been conjectured, that when the Saxons seized this country, they suffered the Britons to live among them in a state of vassalage, employed in the culture of the ground and other laborious and ignoble services. But it is scarcely possible, that a nation, however depressed, should have been mixed with another in considerable numbers without some communication of their tongue, and therefore, it may, with great reason, be imagined, that those, who were not sheltered in the mountains, perished by the sword. The whole fabric and scheme of the English language, is Gothic or Teutonic: it is a dialect of that tongue, which prevails over all the northern countries of Europe, except those where the Slavonian is spoken. Of these languages Dr. Hickes has thus exhibited the genealogy:

GOTHIC,

ANGLO-SAXON,

Dutch,
Frisic,
English.

FRANCIC,

German,

CIMBRIC,

Islandic,
Norwegian,
Swedish,
Danish.

"Of the Gothic, the only monument remaining is a copy of the Gospels somewhat mutilated, which from the silver with which the characters are adorned, is called the silver book. It is now preserved at Upsal, and having been twice published before, has been lately reprinted at Oxford, under the inspection of Mr. Lye, the editor of Junius. Whether the diction of this venerable manuscript be purely Gothic, has been doubted; it seems however to exhibit the most ancient dialect now to be found of the Teutonic race; and the Saxon, which is the original of the present English, was either derived from it, or both have descended from some common parent.

"The first poetry of the Saxons was without rhyme, and consequently must have depended upon the quantity of their syllables; but they began in time to imitate their neighbours, and close their verses with correspondent sounds. The two passages which I have selected, contain apparently the rudiments of our present lyric measures, and the writers may be justly considered as the genuine ancestors of the English poets."

"He mai him sore adreden,
That he thanne ore bidde ne mugen,
Vor that bilimfeth ilome.
Thæ is wis that bit and bote
And bet bivoren dome.
Death com on this midelard
Thurth thas defles onde,
And senne and sosge and iswinc,
On se and on lond."

"About the year 1150, the Saxon began to take a form in which the beginning of the present English may be plainly discovered; this change seems not to have been the effects of the Norman conquest, for very few French words are found to have been introduced in the first hundred years after it; the language must therefore have been altered by causes like those which, notwithstanding the care of writers and societies instituted to obviate them, are even now daily making innovations in every living language. I have exhibited a specimen of the language of this age from the year 1135 to 1140 of the Saxon chronicle, of which the latter part was apparently written near the time to which it relates."

Of this chronicle a few lines may here suffice to gratify the antiquarian:—"This zære for the king Stephne ofer sæ to Normandi. And ther wes under-fangen. forthi that he wenden that he sculde ben alsuic alse the eom wes. And for he hadde get his tresor. ac he to deld it and scatered sotlice. Micel hadde Henri king gadered gold and sylver. and ne god ne didde me for his saule thar of. Tha the king Stephne to Engla-land com tha macod

he his gadering at Oxen-ford. And thar he nam the biscop Roger of Seres-beni. And Alexander biscop of Lincoln— and te Lanceler Roger hise neves. and dide alle in perisuntil hi jafen up here castles. Tha this suikes under-gæton that he milde man was and soft and god. and na justise ne dide. tha didnen hi alle wunder. Hi hadden him manred maked and aihes sueren." &c.

"Nearly about this time (says the Dr.) the following pieces of poetry seem to have been written, of which I have inserted only short fragments: the first is a rude attempt at the present measure of eight syllables, and the second is a natural introduction to Robert of Gloucester, being composed in the same measure, which, however rude and barbarous it may seem, taught the way to the Alexandrines of the French poetry.

"FUR in see bi west spaynge.
If a lond thote cokaygne.
Ther nis lond under heuenriche.
Of wel of godnis hit iliche.
Thoy paradis be miri and briyt.
Cokaygn if of fairir siyt.
What is ther in paradis.
Bot grass and flure and generis.
Thoy ther be ioi and gret dute.
Ther nis met hote frute.
Ther nis halle bure no bench.
Bot watir man if thursto quench.
Beth ther no men but two.
Hely and enok also.
Clinglich may hi go.
Whar ther wonith men no mo." &c.

SANCTA MARGARETTA.

"OLDE ant yonge i preit ou oure folief for to lete.
Thenchet on god that yef ou wit oure sunnes to bete.
Here mai tellen ou. wid wordes feire and swete.
The vie of one meidan. was hoten Maregrete.

Hire fader was a patriac. as ic ou tellen may.
In auntioge wif echef i the false lay.
Deve godes ant doumbe. he served nitt ant day.
So deden mony othere. that singet weilaway.

Theodosius was is nome. on crist ne levede he nouht.
He levede on the false godes. that weren wid honden wrouht.
Tho that child sculde christine ben. ic com him well in thoutt.
E bed wen it were ibore. to dethe it were ibrouht."

"In these fragments, the adulteration of the Saxon tongue, by a mixture of the Norman, becomes apparent; yet it is not so much changed by the admixture of new words, which might be imputed to commerce with the continent, as by changes of its own forms and terminations; for which no reason can be given. Hitherto the language used in this island, however different in successive time, may be called Saxon; nor can it be expected, from the nature of things gradually changing, that any time can be assigned, when the Saxon may be said to cease, and the English to commence. Robert of Gloucester, however, who is placed by the critics in the 13th century, seems to have used a kind of intermediate diction, neither Saxon nor English; in his work therefore we see the transition exhibited, and, as he is the first of our writers in rhyme, of whom any large work remains, a more extensive quotation is extracted. He writes apparently in the same measure with the foregoing author of St. Margarete, which polished into greater exactness, appeared to our ancestors so suitable to the genius of the English language, that it was continued in use almost to the middle of the 17th century.

"Of the batayles of Denemarch, that hii dude in this londe
That worst were of alle othere, we mote abbe an honde.
Worst hii were. vor othere adde somwanne ydo,
As Romeyns & Saxons, & wel wuste that lond therto.
Ac hii ne kepte yt holde nogt, bote robbly, and ssende,
And destrue, & berne, & sle, and ne couthe abbe non ende.
And bote lute yt nas worth, they hii were ouercome ylome.
Vor myd spses and great poer as prest esone hii come.
Kyng Adelwolf of hys lond kyng was twenty zer.
The Deneys come by hym ryuor than he dude er," &c.

"The kyng Aldered sone tho then wey of deth nome,
As yt vel, the vyfty zer of ys kynedom.
At Wymbourne he was ybured, as God gef that cas,
The gode Alfred, ys brother, after hym kyng was.
Alfred, thys noble man, as in the zer of grace he nom
Eygte hondred and syxty and tuelue the kynedom.
Arst he adde at Rome ybe, &c, vor ys grete wysdom,
The pope Leon hym blessedde, tho he thuder com.—
Kyng Alfred was the wysost kyng, that long was bynore.
Vor they me segge the lawes beth in werre tyme vorlore,
Nas yt nogt so hys daye. vor they he in worre were,
Lawes he made rygtuollore, and strengore than er were.
Clerc he was god ynou, and zut, as me telleth me,
He was more than ten zer old, as he couthe ys abece.
Ac ys gode moder ofte smale gyftes hym tok,
Vor to byleue other ple, and loky on his boke.
So that by por clergie ys rygt lawes he wonde,
That neuere er nere y mad, to gouerny ys load.
Hys lyf eygte and twenty zer in ys kynedom ylaste.
After ys deth he was ybured at Wynchestre atte laste."

The following is a quotation from Sir John Mandeville's works who wrote, as himself informs us, in the 14th century. "IN that lond, ne in many othere bezonde that, no man may see the sterre transmontane, that is clept the sterre of the see, that is unmevabe, and that is toward the North, that we clepen the lode sterre. But men see another sterre, the contrarie to him, that is toward the Southe, that is clept Antartyk. And right as the schip men taken here avys here, and governe hem be the lode sterre, right so don schip men bezonde the parties, be the sterre of the Southe, the which sterre apperethe not to us. And this sterre, that is toward the North, that wee clepen the lode sterre, ne apperethe not to hem. For whiche cause, men may wel perceyve that the londe, and the see ben of rownde schapp and forme. For the partie of the firmament schewethe in o contree, that schewethe not in another contree. And men may well preve be experience and soyle compassement of wytt, that zif a man fond passages be schippes, that wold go to serchen the world, men myghte go be schippe all aboute the world, and aboven and benethen."

"The first of our authors, who can be properly said to have written English, was Sir John Gower, who, in his Confession of a Lover, calls Chaucer his disciple, and may therefore be considered as the father of our poetry.

"NOWE for to speke of the commune,
It is to drede of that fortune,
Which hath befall in sondrye londes:
But ofte for defaute of bondes
All sodeinly, er it be wist,
A tunne, when his lie arist
Tobreketh, and renneth all aboute,
Which els shulde noghte gone out." &c.

Dr. Johnson has given several extracts from Chaucer, of which we shall here insert the following:

CHAUCEER.

"ALAS! I wepyng am constrained to begin verse of sorowfull matter, that whilom in florishyng studie make delitable dities. For lo! rendyng muses of Poetes enditen to methinges to be written, and drerie teres. At laste no drede ne might overcome tho muses, that thei ne weren fellows, and followeden my waie, that is to saie, when I was exiled, thei that weren of my youth whilom welfull and grene, comferten now sorowfull wierdes of me olde man: for elde is comen unwarely upon me, hasted by the harmes that I have, and sorow hath commaunded his age to be in me. Heres hore aren shad overtimeliche upon my hed: and the slacke skinne tremblethe of mine emptied bodie. Thilke deth of men is welefull, that he ne cometh not in yeres that be swete, but cometh to wretches often icleped."

Fortescue was chief justice of the Common-Pleas, in the reign of king Henry VI. He retired in 1471, after the battle of Tewkesbury, and probably wrote most of his works in his privacy. The following passage is selected from his book of the "Difference between an absolute and limited Monarchy. "Hyt may peraventure be.

be marvelid by some men, why one Realme is a Lordshyp only Royall, and the Prynce thereof rulyth yt by his Law, callid Jus Regale; and another Kyngdome is a Lordschip, Royal and Politike, and the Prince thereof rulyth by a Lawe, callyd Jus Politicum & Regale; sythen thes two Princes beth of egall Astate. To this dowte it may be answeryd in this manner; The first institution of thes two Realmys, upon the Incorporation of them, is the cause of this diversyte. When Nembroth by Might, for his own Glorie, made and incorporate the first Realme, and subduyd it to hymself by Tyrannye, he would not have it governyd by any other Rule or Lawe, but by his own Will; by which and for th' accomplishment thereof he made it. And therfor, though he had thus made a Realme, holy Scripture denyd to call hym a Kyng, Quia Rex dicitur a Regendo; Whych thyng he dyd not, but oppressyd the People by Myght, and therfor he was a Tyrant, and callid Primus Tyrannorum. But holy Writ callith hym Robustus Vefiator coram Deo. For as the Hunter takyth the wyld beste for to sele and eate hym; so Nembroth subduyd to him the People with Might, to have their service and their goods, using upon them the Lordschip that is called Dominium Regale tantum. After hym Belus that was callid first a Kyng, and after hym his Sone Nynus, and after hym other Panyms; They, by Example of Nembroth, made them Realmys, would not have them rulyd by other Lawys than by their own Wills.

In the time of Sir Thomas More our language was in a great degree formed and settled, and it appears from Ben Jonson, that his works were considered as models of pure and elegant style. The following is introduced as a specimen.

A letter written with a cole by Sir Thomas More to hys daughter maistres Margaret Roper, within a whyle after he was prisoner in the Towre.

"MYNE own good doughter, our lorde be thanked I am in good helthe of bodye, and in good quiet of minde: and of worldly thynges I no more desyer then I have. I beseeche hym make you all mery in the hope of heauen. And such thynges as I somewhat longed to talke with you all, concerning the worlde to come, our Lorde put them into your myndes, as I truste he dothe and better to by hys holy spirite: who blesse you and preserue you all. Written wyth a cole by your tender louing father, who in hys pore prayers forgetteth none of you all, nor your babes, nor your nurses, nor your good husbundes, nor your good husbundes shrewde wyues, nor your fathers shrewde wyfe neither, nor our other frendes. And thus fare ye hartely well for lacke of paper.

THOMAS MORE, knight.

"Of the wits that flourished in the reign of Henry VIII. none has been more frequently celebrated than the earl of Surrey; Dr. Johnson gives among others the following extract.

Description of Spring, wherein eche thing renewes, save only the lover.

"The soote season that bud, and bloome fourth brings,
With grene hath cladde the hyll, and eke the vale,
The Nightingall with fethers new she singes;
The turtle to her mate hath told the tale:
Somer is come, for every spray now springes,
The hart hath hunge hys olde head on the pale,
The bucke in brake his winter coate he flynges;
The fishes flete with newe repayred scale:
The adder all her slough away she flynges,
The swift swallow pursueth the flyes smalle,
The busy bee her honey how she mynges;
Winter is worne that was the floures bale.
And thus I see among these pleasant thynges
Eche care decays, and yet my sorrow sprynges."

"Barclay wrote about 1550; his chief work is the "Ship of Fools" of which the following extract will shew his style.

Of Mockers and Scorners and False Accusers.

O Heartless fooles, haste hear to our doctrine,
Leave off the wayes of your enormitie,
Enforce you to my precept to encline,
For here shall I shewe you good and veritie:
Encline, and ye finde shall great prosperitie,

Ensuing the doctrine of our fathers olde,
And godly lawes in valour worth great golde.

Who that will followe the graces manyfolde
Which are in vertue, shall finde auancement:
Wherefore ye fooles that in your sinne are bolde,
Ensue ye wisdom, and leaue your lewde intent,
Wisdom is the way of men most excellent:
Therefore haue done, and shortly spede your pace,
To quanyt yourself and company with grace.

Learn what is vertue, therein is great solace,
Learn what is truth, sadnes and prudence,
Let grutch be gone, and grauitie purchase,
Forsake your folly and inconuenience,
Cease to be fooles and ay to sue offence,
Follow ye vertue, chiefe roote of godlynes
For it and wisdom is ground of clenlynes.

Wisdom and vertue two thinges are doubtles,
Whiche man endueth with honour speciall,
But suche heartes as slepe in foolishnes
Knoweth nothing, and will nought know at all:
But in this little barge in principall
All foolish mockers I purpose to reprene,
Clawe he his backe that feeleth itche or greue.

"About the year 1553, wrote Dr. Wilson, a man celebrated for the politeness of his style, and the extent of his knowledge: what was the state of our language in his time, the following may be of use to shew:

PRONUNCIATION is an apte orderinge both of the voyce, countenance, and all the whole bodye, accordyng to the worthines of suche wordes and matters as by speache are declared. The vse hereof is such for anye one that liketh to haue prayse for tellyng his tale in open assemble, that hauing a good tongue, and a comely countenance, he shal be thought to passe all other that haue the like vtterance: though they haue much better learning. The tongue geueth a certayne grace to euery matter, and beautifieth the cause in like maner, as a swete soundyng lute muche setteth forth a meane deuised ballade. Or as the sounde of a good instrumente styrrerth the hearers, and moueth much delite, so a cleare soundyng voice comforterth muche our deintie eares, with muche swete melodie, and causeth vs to allowe the matter rather for the reporters sake, then the reporter for the matters sake. Demosthenes therfore, that famous orator, beyng asked what was the chiefe point in al oratorie, gaue the chiefe and onely praise to pronounciation; being demaunded, what was the seconde and the thirde, he still mad aunswere, Pronounciation, and would make none other aunswere, till they lefte askyng, declaring hereby that arte without vtterance can dooe nothyng, vtterance without arte can dooe right muche. And no doubt that man is in outward appaunce halfe a good clarke, that hath a cleane tongue, and a comely gesture of his body. Aeschines lykwyse beyng bannished his countrie through Demosthenes, when he had redde to the Rhodians his own oration, and Demosthenes aunswere thereunto, by force whereof he was bannished, and all they marueiled much at the excellencie of the same: then (quod Aeschines) you would haue marueiled muche more if you had heard hymselfe speake it. Thus beyng cast in miserie and bannished for euer, he could not but geue such great reporte of his deadly and mortal enemy.—These few extracts may be sufficient to give some idea of the state of our language in different periods, and of its progress toward its present copiousness and elegance. For further information see LANGUAGE, GRAMMAR, RHETORIC, and LOGIC.

ENGRAILED, or INGRAILED, in heraldry, a term derived from the French *grêle*, hail; and signifying a thing the hail has fallen upon and broke off the edges, leaving them ragged, or with half-rounds or semicircles struck out of their edges.

ENGRAVING, the art of cutting metals, precious stones, woods, &c. and representing thereon figures, letters, or whatever device or design the artist fancies. Engraving is properly a branch of Sculpture, and is divided into several other branches, according to the matter whereon it is employed, and the manner of performing it. Engraving is an art chiefly of modern invention; having its rise no earlier than the middle of the 15th century. The ancients, indeed, practised engraving on precious stones and crystals with very good success; and there are still many of their works remaining equal to any production of the latter ages. But the art

of engraving on plates and blocks of wood, to afford prints or impressions, was not known till after the invention of painting in oil. Of these last, the most ancient mode is that on wood; the first impressions on paper having been taken from carved wooden blocks. For this invention we are indebted to the brief-malers, or makers of playing cards, who practised the art in Germany, about the beginning of the 15th century. From the same source may perhaps be traced the first idea of moveable types, which appeared not long after; for these brief malers did not entirely confine themselves to the printing and painting of cards, but produced also subjects of a more devout nature; many of which, taken from holy writ, are still preserved in German libraries, with the explanatory text facing the figures; the whole engraved in wood. Thus a species of books was formed; such as, "*Historia sancti Johannis, ejusque Visiones Apocalypticæ*;" "*Historia Veteris & Novi Testamenti*," known by the name of the "*Poor Man's Bible*." These short mementos were printed only on one side; and two of them being pasted together, had the appearance of a single leaf. The earliest date on any of these wooden cuts is 1423. The subject is St. Christopher carrying the infant Jesus over the Sea, preserved in a convent at Buxheim near Menningen. It is of a folio size, illuminated in the same manner as the playing cards; and at the bottom is this inscription,

Christoferi faciem die quaecunque tueris.
Illa nempe die morte mala non morieris.
Millesimo CCCC° XX° tertio.

Upon the invention of moveable types, that branch of the brief-malers business, so far as it regarded the making of books, was gradually discontinued; but the art itself of engraving on wood continued in an improving state; and towards the end of the 15th and beginning of the 16th century, it became customary for almost every one of the German engravers on copper to engrave on wood also. The works of Albert Durer in this style of engraving are justly held in the highest esteem. Italy, France, and Holland, have produced many capital artists of this kind; but for boldness and spirit, we must see the prints of Christopher Jegher, who worked under the direction of Rubens, and was without doubt assisted by that great master. The invention of that species of engraving distinguished by the appellation of *chiaro-scuro*, seems also to be justly claimed by the Germans, and first practised by Mair; one of whose prints of this kind is dated 1499. Many excellent works in *chiaro-scuro* have been produced in France; and in Italy it was honoured with the performances of Titian and Parmegiano; but the attempts of Jackson, Kirkall, and others in England, have not been equally successful. A set of excellent prints in this way have lately been published by J. Skippe, Esq. a connoisseur and dilettante. In Germany, about A. D. 1450, prints from engraved copper first made their appearance. The earliest date of a copperplate print is indeed only 1461; but however faulty this print may be with respect to the drawing, or defective in point of taste, the mechanical part of the execution of it has by no means the appearance of being one of the first productions of the graver. We have also several other engravings, evidently the work of the same master; in which the impressions are so neatly taken from the plates, and the engravings so clearly printed in every part, that, according to all appearance, they could not be executed in a much better manner in the present day, with all the conveniences which the copperplate printers now possess, and the additional knowledge they must necessarily have acquired in the course of more than three centuries. Hence we may fairly conclude, that if they were not the first specimens of the engraver's workmanship, they were much less the first efforts of the copperplate printer's ability. It is likewise to be observed, that Martin Schoen, who is said to have worked from 1460 to 1486, was apparently the scholar of Stoltzshirs; for he followed his style of engraving, and copied from him a set of prints, representing the passion of our Saviour. Now, allowing Stoltzshirs to have preceded his disciple only ten years, this carries the era of the art back to 1450, as was said above. There is no ground to suppose, that it was known to the Italians till at least ten years afterwards. The earliest prints that are known to be theirs are a set of the seven planets, and an almanack by way of frontispiece; on which are directions for finding Easter from 1465 to 1517 inclusive: and we may be assured, that the engravings were not ante-

dated, as the almanack would have thus been less valuable. These prints must therefore have been executed in 1464, which is only four years later than the Italians claim. The three earliest Italian engravers are, Finiguerra, Boticelli, and Baldini. If we are to refer these prints to any of the three, we shall naturally conclude them to be the work of Finiguerra or Baldini; for they are not equal either in drawing or composition to those ascribed to Boticelli, which we know at least were designed by him; and as Baldini is expressly said to have worked from the designs of Boticelli, it will appear most probable that they belong to Finiguerra. With respect to the invention of Etching, it seems to be not well known to whom it is to be ascribed. One of the most early specimens is the print by Albert Durer, known by the name of the Cannon, dated 1518, and thought by some, with little foundation, to have been worked on a plate of iron. Another etching by the same artist is Moses receiving the Tables of the Law, dated 1524. It was also practised in Italy soon after this by Parmegiano, in whose etchings we discover the hand of the artist working out a system as it were from his own imagination, and striving to produce the forms he wanted to express. We see the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no instruction; and that it was something entirely new to him. If the story is true, that he kept an engraver by profession in his house, the novelty of the art is rendered so much the more probable. He died in 1540. As to that species of engraving in which the modes of etching and cutting with the graver are united, it must have been found necessary immediately upon the invention of etching; it was, however, first carried to perfection by G. Audran, and is now almost universally practised, whether the work is in strokes or in dots. Engraving in dots, the present fashionable method, is a very old invention, and the only mode discovered by the Italians. Agostino de Musis, commonly called Augustine of Venice, a pupil of Marc Antonio, used it in several of his earliest works, but confined it to the flesh, as in the undated print of An Old Man seated upon a Bank, with a Cottage in the back ground. He flourished from 1509 to 1536. We also find it in a print of "A single Figure standing, holding a Cup and looking upwards," by Giulio Campagnola, who engraved about the year 1516. The back ground is executed with round dots, made apparently with a dry point. The figure is outlined with a stroke deeply engraved, and finished with dots, in a manner greatly resembling those prints which Demarteau engraved at Paris in imitation of red chalk. The hair and beard are expressed by strokes. Stephen de Laune, a native of Germany, followed the steps of Campagnola; and many of his slight works are executed in dots only. John Boulanger, a French artist, who flourished in the middle of the last century, and his contemporary Nicholas Van Plattenberg, improved greatly on this method, and practised it with much success. It is only, however, of late, that it has been considered as an object worthy of general imitation. John Lutma executed this kind of work with a hammer and a small punch or chisel. Engraving in mezzotint was invented about the middle of the 17th century; and the invention has generally been attributed to Prince Rupert. Engraving in aquatinta is quite a recent invention, and seems at once to have been carried to perfection by Sandby, and other artists of the present age. Engraving with the tool was the kind originally practised, and it is yet retained for many purposes. For though etching be more easy, and other advantages attend it; yet where great regularity and exactness of the stroke or lines are required, the working with the graver is much more effectual: on which account it is more suitable to the precision necessary in the execution of portraits; as there every thing the most minute must be made out and expressed, according to the original subject, without any licence to the fancy of the designer in deviating from it, or varying the effect either by that masterly negligence and simplicity in some parts, or those bold sallies of the imagination and hand in others, which give spirit and force to history painting.

ENGRAVING ON COPPER, the making, correspondently to some delineated figure or design, such concave lines on a smooth surface of copper, either by cutting or corrosion, as render it capable, when charged properly with any coloured fluid, of imparting by compression an exact representation of the figure or design, to paper or parchment. Whether we consider this branch of engraving, with regard to its utility, the pleasure it affords, or the diffi-

culty that attends its execution, we cannot but confess, that on all these accounts it merits a distinguished rank among the polite arts. By this art the cabinets of the curious are adorned with the portraits of the greatest men of all ages and nations; and their memories, their most remarkable and most glorious actions, are transmitted to the latest posterity. By this art also, the paintings of the greatest masters are multiplied to a boundless number; and the lovers of the polite arts, however widely diffused, are enabled to enjoy those beauties, from which their distant situations would otherwise have for ever debarred them. Persons of moderate fortunes are hereby enabled to become possessed of all the spirit, and all the poetry, contained in those miracles of art, which seemed to have been reserved for the temples of Italy, or the cabinets of princes. When we reflect, that the engraver, beside the beauties of poetic composition, and the artful ordinance of design, is to express, merely by the means of light and shade, all the various tints of colours and clair-obscur; to give a relief to each figure, and a truth to each object; that he is now to paint a sky serene and bright, and then loaded with dark clouds; now the pure tranquil stream, and then the foaming, raging sea; that here he is to express the character of the man, strongly marked in his countenance, and there the minutest ornament of his dress; in a word, that he is to represent all, even the most difficult objects in nature; we cannot sufficiently admire the vast improvements in this art, and that degree of perfection to which it is at this day arrived. There are several methods of engraving on copper, viz. 1. In strokes cut through a thin wax, laid upon the copper, with a point, and these strokes bitten or corroded into the copper with aquafortis. See *ETCHING*. 2. In strokes with the graver alone, unassisted by aquafortis. In this instance, the design is traced with a sharp tool, called a dry point, upon the plate; and the strokes are cut or ploughed upon the copper, with an instrument distinguished by the name of a graver. 3. In strokes first etched, and afterwards finished with the graver: by this expedient the two former methods are united. 4. In dots without strokes, which are executed with the point upon the wax or ground, bitten in with the aquafortis, and afterwards harmonized with the graver, by which instrument small dots are made; or with the graver alone, as in the flesh and finer parts, unassisted with the point. 5. In dots first etched and afterwards harmonized with the dry point, performed by a little hammer, called *opus mallei*, or the work of the hammer, as practised by *Lutma* and others. 6. In *Mezzotinto*. 7. In *Aquatinta*. See these articles. The principal instruments used in engraving with the tool are, graters, scrapers, a burnisher, an oil-stone, and a cushion for bearing the plates. Gravers are made square, for cutting broad and deep, and lozenge for more delicate and fine strokes and hatches. *La Bosse* recommends, as the most generally useful, such as are of a form betwixt the square and lozenge: and he advises, that they should be of a good length, small towards the point, but stronger upwards. The burnisher is used to assist in the engraving on some occasions, as well as to polish the plates. It is seven inches long, and made of fine steel; well polished. The burnisher is formed at one end, and a scraper on the other, each about an inch and a half long from the point: betwixt them, about four inches of the instrument is made round, and serves as a handle. The principal application of it in engraving, besides its use in polishing the plates, is to take out any scratches, or accidental defacings, that may happen to the plates during the engraving; or to lessen the effect of any parts that may be too strongly marked in the work, and require to be taken down. A cushion, as it is called, is generally used for supporting the plate in such a manner, that it may be turned every way with ease. It is a bag of leather filled with sand, which should be of the size that will best suit the plates it is intended to bear. The dry point, or needle, which has been of late much used in engraving, is a tool like an etching point, which being drawn hard on the copper, cuts a stroke, and raises a burr; the burr is scraped off, and there remains a stroke more soft and delicate than can be produced in any other way. The cushion being laid on the table, the plate must be put upon it; and the graver being held in the hand in a proper manner, the point must be applied to the plate, and moved in the proper direction for producing the figures of the lines intended: observing, in forming straight lines, to hold the plate steady on the cushion; and where they are to be finer, to press more lightly, using greater force where they are to be broader and deeper. In

making circular, or other curve lines, hold your hand and graver steadily; and as you work, turn your plate upon the cushion against your graver, otherwise it will be impossible for you to make any circular or curved line with that neatness and command of hand you by this means may. After part of the work is engraved, it is necessary to scrape it with the scraper or graver, passed in the most level direction over the plate, to take off the roughness formed by the cutting of the graver; but great care must be taken not to incline the edge of the scraper or tool used, in such a manner that it may take the least hold of the copper, as it would otherwise produce false strokes, or scratches, in the engraving; and that the engraved work may be rendered more visible, it may afterwards be rubbed over with a roll of felt dipped in oil. In using the graver, it is necessary to carry it as level as possible with the surface of the plate; for otherwise, if the fingers slip betwixt them, the line that will be produced, whether curve or straight, will become deeper and deeper in the progress of its formation; which entirely prevents strokes being made at one cut, that will be fine at their extremities, and larger in the middle; and occasions the necessity of retouching to bring them to that state. For this reason, it is very necessary for those who would learn to engrave in perfection, to endeavour, by frequent trials, to acquire the habit of making such strokes both straight and curving, by lightening or sinking the graver with the hand, according to the occasion. If, after finishing the design, any scratches appear, or any part of the engraving be falsely executed, such scratches, or faulty parts, must be taken out by the burnisher, and further polished, if necessary, by the above-mentioned roll. The plate being thus engraved, it is proper to round off the edges, by using first a rough file, and afterwards a smoother; and to blunt the corners a little by the same means: after which, the burnisher should be passed over the edges to give it a farther polish. In the conduct of the graver and dry point consists all the art; for which there are no rules to be given; all depending on the habitude, disposition, and genius, of the artist. However, besides the explanations already given, some general observations and directions may not be improper. As the principles of engraving are the same with those of painting, a person cannot expect to attain any considerable degree of perfection in this art, who is not a good master of design; and therefore he ought to be well acquainted both with perspective and architecture: for the former, by the proper gradations of strong and faint colours, will enable him to throw backwards the figures, and other objects of the picture or design which he purposes to imitate: and the latter will teach him to preserve the due proportion of its several orders, which the painter often entrusts to the discretion of the engraver. In order to preserve equality and union in his works, the engraver should always sketch out the principal objects of his piece before he undertakes to finish them. In working, the strokes of the graver should never be crossed too much in a lozenge manner, particularly in the representation of flesh, because sharp angles produce the unpleasant effect of lattice-work, and take from the eye the repose which is to it agreeable in all kinds of picturesque designs: we should except the case of clouds, tempests, waves of the sea, the skins of hairy animals, or the leaves of trees, where this method of crossing may be admitted. But in avoiding the lozenge, it is not proper to get entirely into the square, which would give too much of the hardness of stone. In conducting the strokes, the action of the figures, and of all their parts, should be considered; and it should be observed how they advance towards, or recede from the eye; and the graver should be guided according to the risings or cavities of the muscles or folds, making the strokes wider and fainter in the light, and closer and firmer in the shades. Thus the figures will not appear jagged; and the hand should be lightened in such a manner, that the outlines may be formed and terminated without being cut too hard; however, though the strokes break off where the muscle begins, yet they ought always to have a certain connection with each other, so that the first stroke may often serve by its return to make the second, which will shew the freedom of the engraver. In engraving the flesh, the effect may be produced in the lighter parts and middle tints by long pecks of the graver, rather than by light lines; or by round dots; or by dots a little lengthened by the graver: or, best of all, by a judicious mixture of these together. In engraving the hair and the beard, the engraver should begin his work by

laying the principal grounds, and sketching the chief shades in a careless manner or with a few strokes; and he may finish it at leisure with finer and thinner strokes to the extremities. When architecture or sculpture is to be represented, except it be old and ruinous buildings, the work ought not to be made very black; because, as edifices are commonly constructed either of stone or white marble, the colour, being reflected on all sides, does not produce dark or brown shades as in other substances. White points must not be put in the pupils of the eyes of figures, as in engravings after paintings; nor must the hair or beard be represented as in nature, which makes the locks appear flowing in the air; because in sculpture there can be no such appearances. In engraving cloths of different kinds, linen should be done with finer and closer lines than other sorts, and be executed with single strokes. Woollen cloth should be engraved wide, in proportion to the coarseness and fineness of the stuff, and with only two strokes; and when the strokes are crossed, the second should be smaller than the first, and the third than the second. Shining stuffs, which are generally of silk or satin, and which produce flat and broken folds, should be engraved more hard and more straight than others, with one or two strokes, as their colours are bright or brown; and between the first strokes others smaller must be joined, which is called interlining. Velvet and plush are expressed in the same manner, and should always be interlined. Metals, as armour, &c. are also represented by interlining, or by clear single strokes. In architecture, the strokes which form the rounding object should tend to the point of sight; and when whole columns occur, it is proper to produce the effect as much as possible by perpendicular strokes. If a gross stroke is put, it should be at right angles, and wider and thinner than the first stroke. In engraving mountains, the strokes ought to be frequently discontinued and broken, for sharp and craggy objects; and they should be straight, in the lozenge manner, and accompanied with long points or dots; and rocks should be represented by cross strokes more square and even. Objects that are distant towards the horizon should be kept very tender, and slightly charged with black. Waters that are calm and still are best represented by strokes that are straight, and parallel to the horizon, interlined with those that are finer; omitting such places as, in consequence of gleams of light, exhibit the shining appearance of water; and the form of objects reflected from the water, at a small distance upon it, or on the banks of the water, are expressed by the same strokes, retouching more strongly or faintly as occasion may require, and even by some that are perpendicular. For agitated waters, as the waves of the sea, the first strokes should follow the figure of the waves, and may be interlined, and the cross strokes ought to be very lozenge. In cascades, the strokes should follow the fall, and be interlined. In engraving clouds, the graver should sport when they appear thick and agitated, in turning every way according to their form and their agitation. If the clouds are dark, so that two strokes are necessary, they should be crossed more lozenge than the figures, and the second strokes should be rather wider than the first. The flat clouds, that are lost insensibly in the clear sky, should be made by strokes parallel to the horizon, and a little waving; if second strokes are required, they should be more or less lozenge; and when they are brought to the extremity, the hand should be so lightened that they may form no outline. The flat and clear sky is represented by parallel and straight strokes, without the least turning. In landscapes, the trees, rocks, earth, and herbage, should be etched as much as possible; nothing should be left for the graver but perfecting, softening, and strengthening. The dry point produces an effect more delicate than the graver can, and may be used to great advantage in linen, skies, distances, ice, and often in water, especially in small engravings. In most things it is proper to etch the shadows, only leaving the lighter tints for the dry point, graver, &c. To imitate drawings with chalk, a mixture is used of varied and irregular dots, made more or less soft, so as to resemble the grain produced by the chalks on paper. Every stroke of the chalks on paper may be considered as an infinite number of adjoining points, which are the small eminences of the grain of the paper touched by the chalk in passing over it. When the copper-plate has been polished and varnished, or properly prepared, as in the common method of engraving, the drawing to be imitated may be counterproved on the varnish of the plate. If this cannot be conveniently done, black lead pencil, or red chalk,

must be applied to varnished or oiled paper; and by means of this chalk or pencil, all the traces of the original will be transmitted to the varnish. The outlines of the object must be formed in the etching by points, whose magnitude and distance must be determined by the quality of the strokes in the original drawing. The artist may be provided with pointed instruments or needles of various sizes with single or double points. In forming the light and shade, he should distinguish between those hatches which serve to express the perspective of the object, and those which form the ground of it. The principal hatches should be more strongly marked; the middle tints, if etched, should be marked lightly, or they may be left till the varnish is taken off, and be perfected with a greater degree of softness, by needles, or the point of the graver, as the original may require. There is nothing peculiar in the method of applying the aquafortis in this kind of engraving; but it may be observed, that it should not be left so long as to corrode the lighter parts too much; if the light parts are sufficiently corroded, they may be stopped out with turpentine, varnish, and lamp black, mixed together, and the aquafortis may be applied again to the stronger parts; for it will be no detriment to them, if the points which compose the shade burst into one another, provided the extreme be avoided. When the work of the aquafortis is finished, and the varnish taken off the copper, it will be necessary in the softest parts, such as the flesh, &c. to interstipple with proper points; as an effect will be thus produced more delicate than it is possible to attain with the aquafortis only; and the strongest shades will require additional strength to be given them with small strokes of the graver. Drawings made with chalks of different colours, may be imitated in this manner, if a plate be provided for every colour. This method of engraving is intended to form a kind of deception, so that the connoisseur may not be able, on the first inspection, to distinguish between the original drawing, and the engraving, made in imitation of it: and it is extremely useful, as it serves to multiply copies of drawings left by those masters who excelled in the use of chalks, and thus to form and improve young artists, who could not have access to the originals in the practice of drawing.

ENGRAVING ON GLASS, is performed by the same process as etching on copper; only using the fluoric instead of the nitrous acid. See ETCHING.

ENGRAVING ON PRECIOUS STONES, is the representing of figures, or devices in relief, or indented, on divers kinds of hard polished stones. The ancients excelled in this art; there being divers antique agates, cornelians, and onyxes, which surpass any thing of that kind the moderns have produced. Pyrgoteles among the Greeks, and Dioscorides under the first emperors of Rome, are the most eminent engravers we read of: the former was so esteemed by Alexander, that he forbade any body else to engrave his head; and Augustus's head, engraven by the latter, was deemed so beautiful, that the succeeding emperors chose it for their seal. All the polite arts having been buried under the ruins of the Roman empire, the art of engraving on stones met with the same fate. It was retrieved in Italy at the beginning of the 15th century, when one John of Florence, and after him Dominic of Milan, performed works of this kind no way to be despised. From that time, such sculptures became common in Europe, and particularly in Germany, whence great numbers were sent into other countries; but they came short of the beauty of those of the ancients, especially those on precious stones; for, as to those on crystal, the Germans, and after their example the French, &c. have succeeded well enough. In this branch of engraving, either the diamond or emery may be used. The diamond, which is the hardest of all stones, is only cut by itself, or with its own matter. The first thing to be done in this branch of engraving is, to cement two rough diamonds to the ends of two sticks big enough to hold them steady in the hand, and to rub or grind them against each other till they be brought to the form desired. The dust or powder that is rubbed off, serves afterwards to polish them, which is performed with a kind of mill that turns a wheel of soft iron. The diamond is fixed in a brass dish; and, thus applied to the wheel, is covered with diamond dust, mixed up with the oil of olives; and when the diamond is to be cut facet-wise, they apply first one face, then another, to the wheel. Rubies, sapphires, and topazes, are cut and formed the same way on a copper wheel, and polished with tripoli diluted in water. As to agates, amethysts, emeralds,

emeralds, hyacinths, granites, rubies, and others of the softer stones, they are cut on a leaden wheel, moistened with emery water, and polished with tripoli on a pewter wheel. Lapis lazuli, opal, &c. are polished on a wooden wheel. To fashion and engrave vases of agate, crystal, lapis lazuli, or the like, a kind of lathe, like that used by pewterers, is used to hold the vessels, which are to be wrought with proper tools; that of the engraver generally holds the tools, which are turned by a wheel; and the vessel is held to them to be cut and engraved, either in relief or otherwise; the tools being moistened from time to time with diamond dust and oil, or at least emery and water. To engrave figures or devices on any of these stones, when polished, such as medals, seals, &c. they use a little iron wheel, the ends of whose axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought closer, or set further apart, at pleasure; at one end of the axis are fitted the proper tools, being kept tight by a screw. Lastly, The wheel is turned by the foot, and the stone applied by the hand to the tool, and is shifted and conducted as occasion requires. The tools are generally of iron, and sometimes of brass; their form is various, but they generally bear some resemblance to chisels, gouges, &c. Some have small round heads, like buttons, others like ferrets, to take the pieces out, and others flat, &c. When the stone has been engraved, it is polished on wheels of hair brushes and tripoli.

ENGRAVING ON STEEL is chiefly employed in cutting seals, punches, matrices, and dyes, proper for striking coins, medals, and counters. The method of engraving with the instruments, &c. is the same for coins as for medals and counters: all the difference consists in their greater or less relief; the relief of coins being much less considerable than that of medals, and that of counters still less than that of coins. Engravers in steel commonly begin with punches, which are in relief, and serve for making the creux or cavities of the matrices and dyes; though sometimes they begin with the creux or hollowness; but then it is only when the intended work is to be cut very shallow. The first thing that is done, is designing the figures; the next is the moulding them in wax, of the size and depth they are to lie, and from this wax the punch is engraven. When the punch is finished, they give it a very high temper, that it may the better bear the blows of the hammer with which it is struck, to give the impression to the matrix. The steel is made hot to soften it, that it may the more readily take the impression of the punch; and after striking the punch on it in this state, they proceed to touch up or finish the strokes and lines, where, by reason of their fineness, or the too great relief, they are any thing defective, with steel gravers of different kinds, chisels, flatters, &c. being the principal instruments used in graving on steel. The figure being thus finished, they proceed to engrave the rest of the medal, as the mouldings of the border, the engraved ring, letters, &c. with little steel punches well tempered, and very sharp.

ENGRAVING ON WOOD. See **CUTTING**. It is performed in three different modes, viz. 1. With a single block, on which the design is traced with a pen, and those parts which should be white carefully hollowed out. This block is afterwards printed by the letter-press printers, in the same manner as they print a book. 2. With two, three, or more blocks; the first having the outlines cut upon it; the second is reserved for the darker shadows; and the third for the shadows which terminate upon the lights; and those are substituted in their turn, each print receiving an impression from every block. This mode of engraving is called *chiaro-scuro*, and was designed to represent the drawings of the old masters. 3. On wood and on copper: in these the outline is engraved in a bold dark style upon the copper; and two or more blocks of wood are substituted to produce the lighter and darker shadows, as before.

ENGUCHE, in heraldry, is said of the great mouth of a hunting horn, when its rim is of a different colour from that of the horn itself.

ENHARMONIC, in music. The Greeks had three different species of music; the Diatonic, the Chromatic, and the Enharmonic. This last was esteemed by much the most agreeable and powerful of the three; but the difficulty of its execution rendered its duration short, and later artists were upbraided for having sacrificed it to their indolence.

ENIGMA. See **ÆNIGMA**.

ENEISEISK, a fortified town of Russian Siberia, in the government of Tobolsk, 400 miles E. N. E. of Kollivan.

ENMANCHE, in heraldry, [from *manché*, Fr. *i. e.* a sleeve,] is when lines are drawn from the centre of the upper edge of the chief to the sides, to about half the breadth of the chief; signifying sleeved, or resembling a sleeve.

ENNA, in ancient geography, a town of Sicily, situated on an eminence S. of the Chrysas; called the centre of Sicily.

ENNEAGON, [from *ennea* and *γωνία*,] in geometry, a polygon with nine sides. See **POLYGON**.

ENNEANDRIA, in botany, [from *ennea*, nine, and *andria*, a man,] the 9th class in Linnaeus's sexual system, consisting of plants which have hermaphrodite flowers with 9 stamina or male organs. See **BOTANY**.

ENNERIS, in ancient ship-building, a galley with nine tires of oars.

ENNIS, or **CLARE**, the capital of Clare county, in Ireland. It is 112 miles S. W. of Dublin. Lon. 9. 0. W. Lat. 52. 42. N.

ENNISCORTHY, a town of Ireland, in Wexford, Leinster; 59 miles S. of Dublin.

ENNISKERRIES, two islands of Ireland, in Kilmurphy Bay, 6 miles off the coast of Clare county. Lon. 9. 35. W. Lat. 52. 40. N.

ENNISKILLEN. See **INNISKILLEN**.

ENNUI, a French word introduced into the English language, to express that listless state of insipidity and inactivity of body and mind, with which people in high life are often tormented, at those intervals of habitual dissipation, which lie heavy upon them, when, having no object that immediately interests their passions, they feel themselves totally at a loss how to employ, or, as the fashionable world express it, to kill their time; and who, of consequence spend it in drowsy yawnings, till the hour of dissipation or riot returns. In a word, Ennui is a disease of the mind, wherein the body is in some degree affected, produced by continued habits of indolence, luxury and dissipation, or frivolous amusement, and which greatly detracts from the happiness of those, who, if they were to employ the gifts of fortune in a more rational manner, would have it in their power to fill up every moment of life, in the purest and most perfect happiness that the present state of human nature affords, by enjoying felicity themselves, and dispensing it to all around them.

ENO, or **ENOS**, a town of European Turkey, in Romania, 28 miles N. W. of Gallipoli. Lon. 26. 15. E. Lat. 40. 46. N.

ENOCH, [חֵנֹךְ, Heb. *i. e.* dedicated,] the son of Cain, in honour of whom

ENOCH, the first city taken notice of in scripture, was so called by Cain, who built it. It was situated E. of Eden. Gen. iv. 17.

ENOCH, the son of Jared and father of Methuselah, was born A. M. 622. At the age of 65 he begat Methuselah, and lived 300 years after, and had several sons and daughters. Enoch walked with God; and after that he had lived 365 years, "he was not, for God took him." Some construe these last words, as if they intimated that Enoch died a natural death, because in reality he lived not near so long as the other patriarchs of those times; as if God, to secure him from corruption, had taken him early out of this world. But the generality of the fathers and commentators assert that he died not, but was translated out of the sight of men, as Elijah was. The apostle Paul shews very clearly that Enoch was translated, and did not see death, Heb. xi. 5. The eastern people, who called Enoch Edris, believe that he received from God the gift of wisdom and knowledge; and that God sent him 30 volumes from heaven, filled with all the secrets of the most mysterious sciences. The Rabbins maintain, that when Enoch was translated to heaven, he was admitted into the number of the angels, and is the person generally known by the name of Michael.

ENOCH, THE PROPHECY or, an apocryphal book, ascribed to Enoch. The apostle Jude (ver. 14, 15,) cites a passage from the book of Enoch, which has much exercised interpreters. The question is, whether the apostle took this passage out of any particular book written by Enoch, which might be extant in the first ages of the church? whether he received it by tradition? or lastly, by some particular revelation? It is thought probable, that he read it in the book ascribed to Enoch, which, though apocryphal, might contain several truths that St. Jude, who was favoured with a supernatural degree of understanding, might make use of to the edification of the faithful. The ancients greatly esteemed this work. Tertullian expresses his concern, that it was not generally received. That father, on the authority of this book, deduces the original

original of idolatry, astrology, and unlawful arts, from the revolted angels, who married with the daughters of men. St. Augustine allows, indeed, that Enoch wrote something divine, because he is cited by St. Jude; but he says, it was not without reason that this book was not inserted in the canon, which was preserved in the temple at Jerusalem. This father sufficiently insinuates, that the authority of this book is doubtful, and that it cannot be proved that it was really written by Enoch. Indeed the account it gives of giants engendered by angels, and not by men, has manifestly the air of a fable, and the most judicious critics believe it ought not to be ascribed to Enoch. This book laid a long time buried in darkness; till the learned Joseph Scaliger recovered a part of it. Scaliger, Vossius, and other learned men, attribute this work to one of those Jews who lived between the time of the Babylonish captivity and that of Jesus Christ. Others are of opinion, that it was written after the rise and establishment of Christianity, by one of those fanatics with whom the primitive church was filled, who made a ridiculous mixture of the Platonic philosophy and the Christian divinity.

ENOS, the son of Seth and father of Cainan, was born, A. M. 235. Moses tell us (Gen. iv. 26,) that then "men began to call upon the name of the Lord;" or, as others translate it, that "Enos began to call upon the name of the Lord;" or was the inventor of religious rites and ceremonies in the external worship. This worship was kept up and preserved in Enos's family, while Cain's family was plunged in all kinds of immorality and impiety. Several Jews are of opinion, that idolatry was first introduced into the world at the time of Enos. They translate the Hebrew thus, "Then men began to profane the name of the Lord." Good men, to distinguish themselves from the wicked, began to take upon them the quality of sons or servants of God; for which reason, Moses, (Gen. vi. 1, 2,) says, that the sons of God; (that is to say the descendants of Enos, who had hitherto preserved the true religion), seeing the daughters of men, that they were fair, took them wives of all which they choose. Enos died at the age of 905; A. M. 1140.

ENOTARUSK, a town of Russia in the government of Caucasus, 72 miles N. N. E. of Astracan.

ENS, [Lat.] any being or existence.

ENS POSITIVUM, & **ENS REALE**, terms used in the schools by metaphysicians, synonymously with ens, for entity, as above defined, by way of distinction from

ENS RATIONIS, an imaginary being, or a thing that exists only in the imagination.

ENS, among chemists, imports the power, virtue, and efficacy, which certain substances exert upon our bodies.

ENS, in geography, a river of Germany, which rises in Saltsburgh, and runs into the Danube.

ENS, or **ENNS**, a city of Austria, seated on an eminence, at the conflux of the Ens and the Danube; and strongly defended by an arsenal and two castles. It lies 90 miles W. by S. of Vienna.

ENS, a town of Batavia in the department of the Yssel, and island of Schokland, in the Zuyder Zee: 10 miles N. W. of Campen.

ENSATÆ, in botany, [from *ensis*, a sword;] the 6th order in Linnaeus's natural method.

ENSAY, a small inhabited island of Scotland, in the county and on the coast of Inverness; four miles E. of Berneray.

ENSEELED, in falconry, a term applied to a hawk that has a thread drawn through her upper eye-lid, and made fast under her beak, to take away the light.

ENSEMBLE, [from *in* and *simul*, Lat.] a French term, sometimes used in English; literally signifying together, or one with another. In architecture, the ensemble, or tout ensemble, of a building, means the whole work, or composition, considered together, and not in parts; and sometimes also, the relative proportion of the parts to the whole.—"All those pieces of building make a fine ensemble."—"This picture is good, taking the parts separately; but the tout ensemble is bad."

ENSENE, a town of Egypt, on the E. side of the Nile; 120 miles S. of Cairo. Lon. 30. 54. E. Lat. 28. 5. N.

ENSIGN, [*enseigne*, Fr.] in the military art, a banner under which the soldiers are ranged according to the different companies or parties they belong to. See **COLOURS**, **FLAG**, **STANDARD**, &c. The European ensigns are pieces of taffety with various fi-

gures, arms, and devices, painted on them, in different colours; the Turkish ensigns are horses-tails.

ENSIGN is also the officer that carries the colours, being the lowest commissioned officer in a company of foot, subordinate to the captain and lieutenant. It is a very honourable and proper post for a young gentleman at his first coming into the army: he is to carry the colours both in assault, day of battle, &c. and should not quit them but with his life: he must always carry them himself on his left shoulder: only on a march he may have them carried by a soldier. If the ensign be killed, the captain must carry the colours in his stead.

ENSIGN, NAVAL, a large standard or banner hoisted on a long pole erected over the poop, and called the ensign staff. The ensign is used to distinguish the ships of different nations from each other; and to characterise the different squadrons of the navy. The British ensign in ships of war is known by a double cross, viz. that of St George and St Andrew, formed upon a field which is either red, white, or blue.

ENSIGNS, ANCIENT. The ensign of the ancient Persians, according to Xenophon, was a golden eagle on a white flag; the Corinthians bore a Pegasus, or winged horse, on theirs; the Athenians an owl; the Messenians, the Greek letter M; the Lacedæmonians, the Δ . The Romans had a great diversity of ensigns; the wolf, minotaur, horse, boar, and at length the eagle, where they stopped: this was first assumed in the 2d year of the consulate of Marius. A military ensign on a medal of a Roman colony, denotes it a colony peopled with old soldiers.

ENSISHEIM, a town of France, in the department of the Upper Rhine, and late province of Alsace, 10 miles S. W. of Brisac.

ENSKIRKEN, a town of Germany, in the late duchy of Juliers, 15 miles S. W. of Cologne.

ENTABLATURE, or **ENTABLEMENT**, the architrave, frieze, and cornice, of a pillar; being in effect the extremity of the flooring, which is either supported by pillars, or by a wall, if there be no columns. Harris.

ENTABLER, in the manege, the fault of a horse, whose croupe goes before his shoulders in working upon volts; which may be prevented by taking hold of the right rein, keeping your right leg near, and removing your left leg as far from the horse's shoulders as possible.

ENTAIL, in law, signifies fee tail, or fee entailed; that is, abridged, curtailed, or limited, to certain conditions. See **FEU**, and **TAIL**.

ENTE, in heraldry, a method of marshalling, used more frequent abroad than with us, and signifying grafted. We have, indeed, one instance of enté, in the grand quarter of his majesty's royal ensign, whose blazon is Brunswick and Lünenburg impaled with ancient Saxony, enté en pointe, "grafted in point."

ENTEROCÉLE, [*εντεροκηλη*], a rupture from the bowels pressing through or dilating the peritonæum, so as to fall down into the groin. The remedy in such cases, is chiefly by trusses and bolsters. Quincy.

ENTEROLOGY, [*εντερον* and *λογος*], the anatomical account of the bowels and internal parts. See **ANATOMY**.

ENTEROMPHALOS, [*εντερον* and *ομφαλος*], an umbilical or navel rupture.

ENTHUSIASM, [*ενθουσιασμος*], an ecstasy of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner. This is the enthusiasm felt in poetry, oratory, music, painting, sculpture, &c.

ENTHUSIASM, in a religious sense, implies a transport of the mind, whereby it fancies itself inspired with some revelation, impulse, &c. from heaven. Mr. Locke gives the following description of religious enthusiasm. "In all ages, men in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a great familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themselves with a persuasion of an immediate intercourse with the Deity, and frequent communications from the Divine Spirit. Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the Spirit of God. And whatsoever odd action they find in themselves a strong inclination to do, that impulse is concluded to be a call or direction from heaven, and must be obeyed."

obeyed. It is a commission from above, and they cannot err in executing it. This I take to be properly enthusiasm, which, though arising from the conceit of a warm and overweening brain, works, when it once gets footing, more powerfully on the persuasions and actions of men, than either reason or revelation, or both together; men being most forwardly obedient to the impulses they receive from themselves."

ENTHYMEME, in logic and rhetoric, [from *ενθυμησθαι*, to think, or conceive, a compound of *εν* and *θυμος*, mind,] is the most simple and elegant of all argumentations; being what a man, in arguing closely, commonly makes, without attending to the form. Thus, that verse remaining of Ovid's tragedy, intitled *Medea*, contains an enthymeme; *Servare potui, perdere an possum rogas*: "I was able to save you; consequently to have destroyed you." All the beauty would have been lost, had all the propositions been expressed; the mind is displeased with a rehearsal of what is no ways necessary. This kind of syllogism is perfect in the mind,

but imperfect in the expression, because one of the propositions is suppressed, as being easily supplied by the understanding of those with whom we discourse, e. g. Every man is mortal; therefore every king is mortal: where the minor proposition, every king is a man, is omitted as being sufficiently known. There is a particular elegance in the enthymeme form of arguing, as leaving somewhat to the exercise and invention of the mind; for which reason it is very frequent, as well in common conversation, as in the most polite writers. It not only shortens discourse, and adds a certain force and liveliness to our reasoning, but gives the reader a pleasure not unlike that the author himself feels in composing. Hence we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us.

ENTIERTIE denotes the whole, in contradistinction to moiety, which denotes the half; and a bond, damages, &c. are said to be entire when they cannot be apportioned.

ENTIRE TENANCY, signifies a sole possession in one man.

ENTOMOLOGY.

ENTOMOLOGY, [from *εντομη*, an insect, and *λογος*, a discourse,] the science of insects, a branch of zoology, which treats exclusively of this class of animals. The name of this science appears to be modern, but the study of the science is undoubtedly very ancient. Solomon, who is perhaps the most ancient zoologist, as well as botanist on record, is expressly said (1 Kings iv. 33,) to have "spoken also" (or written) "of creeping things," and may therefore be ranked as the earliest entomologist we know of. It is to be regretted that his works on this, as well as on many other subjects, are lost. But without attempting to enumerate the various ancient authors, who, since Aristotle and Pliny, have written upon this branch of natural history, we shall only mention here, that the great Linnæus may be justly considered as the father of Entomology as a distinct branch of science. Several modern authors, however, contributed to pave the way for Linnæus's improvement of entomology. Among these none has greater merit than the illustrious Dr. Swammerdam, that great inquirer into nature, who, by his ingenious and nice contrivances for dissecting the minutest insects, opened a field of investigation, and a fund of science, formerly quite unoccupied, and unknown. Insects being endowed with the various powers of creeping, flying, and swimming, there is scarce any place, however remote and obscure, in which they are not to be found. The great confusion which appeared to the ancients to arise from their number, made them never attempt to reduce them to any system. Swammerdam observed, that their metamorphoses were divided by nature into several states or orders. Their external appearance also carried with it some mark of distinction: so that entomologists called all those of the coleoptera order, Scarabæi, or beetles; those of the lepidoptera, Papiliones, butterflies; those of the gymnoptera order that had only two wings, Muscæ, flies; and those of the same order that had four wings, Apes, bees. No farther progress was made in the systematic part of this science till the time of Linnæus. He was the first who undertook to determine the genera, and assign them their proper characters, in the "*Systema Naturæ*;" and thus reduced this science to a systematic form. This system, in subsequent editions, was considerably enriched and amended by him, inasmuch that the science of entomology now shines forth in its full lustre. He first instituted natural orders, and reduced them into genera by expressive names; determined an infinite number of species in the "*Fauna Succica*" and "*Museum Regina*;" collected with incredible pains the synonymous names given by the various authors who had written on them; and, lastly added their descriptions, and the places in which they were to be found. So that the system of this illustrious author will lead any person, without the assistance of a master, for the most part, easily to ascertain the name of any insect he may meet with. Before his time, scarce more than 200 insects were known; whereas, in the last edition of his system, he has determined the names of nearly 3000 distinct species; though this is not the sixth

part of the number that is now known. Notwithstanding the great degree of perfection to which Linnæus had brought entomology, several authors have since made considerable alterations in his system. Among these, the most distinguished are Geoffroy, Scopoli, and Schæffer. The first of these entomologists, in his "*Histoire Abrégée des Insectes*," published at Paris in 1764, has, besides changing the orders, or first grand divisions of the Linnæan system, formed from different families of Linnæan genera many new genera; "some of them" (says Mr. Thomas Pattenison Yeats, in the Preface to his "*Institutions of Entomology*," p. vi.) "very judiciously; others perhaps without sufficient grounds."—"Scopoli, (he adds,) in his *Entomologia Carniolicæ*, published at Vienna in 1763, has made few alterations in the Linnæan system, but those seem every one to be well founded, and his specific characters equal those of Linnæus. Schæffer, in his *Elementa Entomologia*, printed at Ratisbon in 1766, has followed Geoffroy with very few and inconsiderable variations; but his figures convey a pretty good idea of his genera." Mr. Yeats also mentions the system of Poda, a Jesuit, as "a work much praised by Scopoli, which alone is sufficient to convey an advantageous idea of it," but adds, that he "had not been able to procure it, nor learn how or in what he differs from Linnæus." On the whole, as the Linnæan system of Entomology is still esteemed to be at least as perfect as those of any of his successors, it will be sufficient here to give the young entomologist a view of it, with a few of the synonyma of other authors, whom he may afterwards consult if he inclines. Those who are desirous of attaining a systematic knowledge of insects, ought first to acquire the terms made use of in the science, that they may be able rightly to denominate every part of an insect. The student should first know what an insect is, lest he mistake Hippocampi, and other amphibious animals, for them, as was formerly done; or confound them with Vermes, which Linnæus first distinguished from insects, and which differ as essentially from them as the class Mammalia do from birds. Every insect is furnished with a head, antennæ, and feet, of all which the vermes are destitute. All insects have six or more feet; they respire through pores on the sides of their bodies, which are termed spiracula: their skin is extremely hard, and serves them instead of bones, of which they have internally none. From this definition, the *acus marina* is evidently no insect. But the antennæ placed on the fore-part of the head constitute the principal distinction. These are jointed and moveable in every part, in which they differ from the horns of other animals: they are organs conveying some kind of sense; but we have no more idea of what this kind of sense is, than a man has, who, without eyes, attempts to determine the particular action of the rays of light on the retina of the eye, or to explain the changes which from thence take place in the human mind. That they are the organs of some kind of sense, is apparent from their perpetually moving them forward; yet the hard crust with which they are invested

vested, and their shortness in flies and other insects, would induce one to believe them not to be in the organs of touch: Mr. Barbut supposes them to constitute or to contain the organs of hearing. That they are tubular, and filled with air and some kind of humour, appears from the antennæ of butterflies immersed in water.

OF THE EXTERNAL PARTS OF INSECTS.

The external parts of the bodies of insects, agreeably to the usual anatomical division of those in larger animals, may be divided into the head, trunk, abdomen, and extremities.

I. CAPUT, the HEAD. It is asserted in the "Fundamenta Entomologiae," that this part in insects is without brain. The difference between the brain and spinal marrow consists in the former being a medullary part organized. We do not deny the existence of a medullary thread in the heads of insects, but we never could discover it to be organized: hence the hippobosca equina, or horse-fly, will live, run, nay even copulate, after being deprived of its head; to say nothing of many others which are capable of living long under the same circumstances. Insects not being apparently furnished with ears, they have been supposed to be incapable of hearing; as we can no more conceive that sense to exist without ears than vision without eyes. That they are nevertheless susceptible of any shrill or loud noise, as well as fishes, is indisputable; but it has been supposed to be in a manner different from that of hearing. Mr. Barbut, however, thinks they possess this sense in a very distinct manner. Many insects, he observes, are well known to be endowed with the power of uttering sounds, such as large beetles, the bee, wasp, common fly, gnat, &c. The sphinx atropos squeaks, when hurt, nearly as loud as a mouse. Now, if insects are endowed with the power of uttering sounds, it certainly must be for some purpose. As they vary their cry occasionally, it must certainly be designed either to give notice of pleasure or pain, or some affection in the creature who possesses it. "The knowledge of their sounds (he justly argues) is undoubtedly confined to their tribe, and is a language intelligible to them only; saving when violence obliges the animal to exert the voice of nature in distress, craving compassion; then all animals understand the doleful cry. For instance, attack a bee or wasp near the hive or nest, or a few of them: the consequence of that assault will be, the animal or animals, by a different tone of voice, will express his or their disapprobation or pain; that sound is known to the hive to be plaintive, and that their brother or brethren require their assistance; and the offending party seldom escapes with impunity. Now, if they had not the sense of hearing, they could not have known the danger their brother or brethren were in by the alteration of their tone." The organ of hearing, in our author's opinion, is situated in the antennæ; both from their situation in the part of the head most favourable to such organs, their inward structure being moveable, the ears of most inferior animals being so. He has never considered the antennæ as either offensive or defensive, but has observed them to be endowed with an exquisite sense of feeling; that the animal appeared to be in agony when its antennæ were pinched; and that it takes care to avoid the touching of any hard substance with them roughly. "This tenderness in the organ of hearing (says he) is common to all animals; and insects seem to be particularly tender in these parts by quickly withdrawing them from the touch." Mr. Barbut further observes, that the antennæ of all insects are composed of joints varying in size, form, and number. Those who are chiefly confined to live under water have their antennæ in general shorter than those who live on land. Some who roam at large in the air, have them long and slender. They are all hollow, and are rendered flexible by the joints, which are very visible in the horns of the crab and lobster. This hollowness, in our author's opinion, is to receive the sound communicated to the extremities of the antennæ by the repercussion of the air affected by any noise; and convey it, by means of the joints, from one to another, till it arrives in that lessened degree of tone best suited to the timid nature of the animal. In this circumstance there may be many variations in point of perfection in those organs; the strength, utility, and degree of power in receiving sound, being proportioned to the necessities of the animals, different in their nature and requisites. In most animals, the entrance to the auricular organ is palatous; but in this case the animal would suffer great inconveni-

ence from such an organization, as the organ would often be clogged with dirt, &c. Several entomologists have doubted, whether insects have the sense of smell, no organ being found in them adapted to that purpose: and although it was evident they had a perception of agreeable and fetid effluvia, it was thought to be in a manner altogether unknown to us. Mr. Barbut is of opinion, that the organs of smell reside in the palpi or feelers. Many insects have four and some six, two of which are in general cheliform, in order to assist the insect in conveying its food to its mouth. The palpi are in continual motion, the animal thrusting them into every kind of matter, as a hog would do his nose, smelling and searching after food. Insects which apparently do not possess palpi or spiral tongues, have undoubtedly some organ concealed within the mouth analogous to them in function and utility; the fleshy proboscis of the fly is thrust into every substance in which the animal expects to find food; and when it is extended, nearly in the middle are situated, in our author's opinion, two upright palpi, which, no doubt, perform in their turn some office, perhaps that of smell.

TONGUE. Many insects have no tongue, nor make any sound with their mouth; but for this purpose some use their feet, others their wings, and others some elastic instrument with which they are naturally furnished.

EYES. Most insects have two; but the gyrynus has four, the scorpion six, the spider eight, and the scolopendra three. They have no eye-brows, but the external tunic of their eyes is hard and transparent like a watch-glass; their eyes have no external motion, unless it be in the crab. They consist for the most part of one lens only; but in those of the butterfly, dipteræ, and many of the beetles, they are more numerous. Pugett says, he discovered 17,325 lenses in the cornea of a butterfly, and Lieuwenhoek 800 in a fly.

ANTENNÆ. Of these there are in general two (unless four be allowed to some species of crabs,) and placed on the fore-part of the head. They are peculiar to insects, and are plainly distinguishable from the tentaculæ of the vermes, in being crustaceous; and from the palpi of insects, which are more numerous, placed near the mouth, and are sometimes wanting. As the antennæ are of great moment in distinguishing the various kinds of insects, we shall enumerate and explain the several different forms of them. 1. *Setaceæ*, are those which grow gradually taper towards the extremity. 2. *Filiformes*, such as are of the same thickness throughout. 3. *Moniliformes*, are filiform, like the preceding, but consists of a series of round knobs, like a necklace of beads. 4. *Clavate*, such as gradually increase in size toward the extremity. 5. *Capitate*, are clavate, but have the extremity somewhat round. 6. *Fissiles*, are capitate; but have the capitulum, or knob, divided longitudinally into three or four parts, or laminae, as in the scarabæi. 7. *Perfoliata*, are also capitate; but have the capitulum horizontally divided, as in the dermestes. 8. *Pectinata*, so called from their similitude to a comb, though they more properly resemble a feather, as in the moths and elateres. This is most obvious in the male. 9. *Aristatæ*, such as have a lateral hair, which is either naked or furnished with less hairs, as in the fly; *Breviores*, those which are shorter than the body; *longiores*, those which are longer than the body; *mediocres*, those which are of the same length with the body; all three of which varieties are distinguishable in the cerambyces.

PALPI, or FEELERS, resemble filiform, articulated, moveable antennæ. They are most commonly four in number, sometimes six; they are sufficiently distinguished from antennæ, in being naked, short, and always placed at the mouth.

Os, the MOUTH, is generally placed in the anterior part of the head, extending somewhat downwards. In some insects it is placed under the breast, as in the chermes, coccus, cancer (crab,) and curculio.

ROSTRUM, or PROBOSCIS, is the mouth drawn out to a rigid point: in many of the hemiptera class it is bent downward toward the breast and belly, as in the cicada, nepa, notonecta, cimex (bug,) aphid, and remarkably so in some curculiones.

MAXILLÆ, the JAWS, are two in number, sometimes four, and at other times more; they are placed horizontally; the inner edge of them in some insects is serrated or furnished with little teeth.

LINGUA, the TONGUE, in some insects is taper and spiral, as in the

the butterfly; in others it is fleshy, resembling a proboscis, and tubular, as in the fly.

LABIUM SUPERIUS, the UPPER LIP, is situated above the jaws; as in the scarabæus and gryllus.

STEMMATA, or CROWNS, are three smooth hemispheric dots, placed generally on the top of the head; as in most of the hymenoptera, and others.

II. TRUNCUS, the TRUNK, is that part which comprehends the breast or thorax: it is situated between the head and abdomen; and has the legs inserted into it, that its parts may be distinctly determined. It is divided into thorax, scutellum, and sternum.

The **THORAX** is the back part of the breast, and is very various in its shape. It is called *dentatus*, when its sides are armed with points; *spinosis*, when its back is furnished with them, as in the cerambyx; and *marginatus*, when its margin is laterally dilated, as in the silpha and cassida.

SCUTELLUM, or ESCUTCHEON, is the posterior part of the thorax: it is frequently triangular; and appears to be divided from the thorax by an intervening suture, as in most of the coleoptera.

The **STERNUM** is situated on the inferior part of the thorax; it is pointed behind in the elateres, and blind in some of the dytisci.

III. The ABDOMEN is in most insects distinct from the thorax; it is the posterior part of the body of the insect; and is composed of a number of annular segments, which serve occasionally to lengthen or shorten it, and to contain the organs of chylyfication, &c.

SPIRACULA are little holes or pores, placed singly on each side of every segment of the abdomen: through these the insect breathes; and if oil be applied so as to stop them up, it proves fatal to most of them.

TERGUM, the BACK, is the superior part of the abdomen.

VENTER, the BELLY, is the inferior part.

ANUS, is the posterior part of the abdomen, perforated for the evacuation of the excrement. This part also frequently contains the organs of generation.

IV. ARTUS, the LIMBS, or EXTREMITIES, are the various instruments of motion.

PEDES, the LEGS, consist of several parts. The first joints of the leg, which is generally thickest, is called femur; the second, which is generally of the same size throughout, tibia; the third, which is jointed, tarsus; and the last, which in most insects is double, is named unguis. The legs of insects, in general, are named from the various motions they produce: *Cursorii*, from that of running, which are the most numerous; *saltatorii*, from that of leaping; *natatorii*, from that of swimming, &c.—In the *saltatorii*, the thighs are remarkably large, by which means they are able to leap to a considerable distance, as in the gryllus, grasshopper, &c. In those of the *natatorii*, the feet are flat, and edged with hairs, which answer the purpose of oars in assisting them to swim, as in the dytiscus.—*Mutici*, are such feet as have no claws.—*Chelæ*, or claws, are the fore-feet enlarged towards their extremities, each of which is furnished with two less claws, which act like a thumb and finger; as in the crab.

ALÆ, WINGS, the instruments which enable the insect to fly. These are membranous and undivided, except in the instance of the phalænæ alucitæ, in which they are in part divided. Most insects have four; the diptera class, and the coccus, however, have only two. The wing is divided into its superior and inferior surfaces: its anterior part in a butterfly, is that towards the anterior margin, or next to the head; its posterior part, that towards the anus; its exterior part, that towards the outer edge; and the interior, that next the abdomen.

The **ALÆ** are called **PLICATILES**, when they are folded at the time the insect is at rest, as in the wasp; opposite to these are the **Planæ**, which are incapable of being folded. *Erectæ*, such as have their superior surfaces brought in contact when the insect is at rest; as in the ephemera, libellula puella, and virgo, and papilionæ, (butterflies,) *Patentes*, such as remain horizontally extended when the insect is at rest, as in the phalænæ geometræ, and most of the libellulæ. *Incumbentes*, such as cover horizontally the superior part of the abdomen when the insect is at rest. *Deflexæ*, are incumbentes, but not horizontally, the outer edges declining toward the sides. *Reversæ*, are deflexæ, with this addi-

tion, that the edge of the inferior wings projects from under the anterior part of the superior ones. *Dentatæ*, are those in which the edge is serrated, or scolloped; *Caudatæ*, those in which one or more projections in the hinder wings are extended into processes. *Reticulatæ*, when the vessels of the wings put on the appearance of network, as in the hemerobius perla: the two anterior wings generally become superior, and the posterior ones inferior, in moths, when their wings are closed; but the anterior wings are called primary, and the inferior ones secondary, in butterflies, as none can properly be called inferior, when the wings are all erect.

Colores, the colours, are self-apparent and various; but according to their several shapes, they take the different names of puncta, dots; maculæ, spots; fasciæ, bands, which frequently run across and sometimes surround the edge of the wings; strigæ, streaks, which are very slender fasciæ; and lineæ, lines, which are longitudinally extended.

Ocellus, is a round spot, containing a less spot of a different colour in its centre. **Stigma**, another term introduced by Linnaeus, signifies the spot, or anastomosis, in the middle of the wing near the anterior margin; it is conspicuous in most of the hymenoptera and neuroptera, and even in the coleoptera. The single or double kidney-shaped spot, situated in the same part of the anterior wings, and frequently occurring in the phalænæ, is distinguished likewise by the name of stigma.

Elytra, the plural of elytron. The upper wings, which are of a hard substance, in some degree resembling leather, and which in most insects are of a very hard texture, but in others flexible, are called elytra; their superior surface is generally convex, their inferior one concave. When the insect flies, they are extended; and shut when it rests, closing together, and forming a longitudinal suture down the middle of the back, as in the coleoptera. They are of various shapes. *Abbreviatæ*, when shorter than the abdomen. *Truncatæ*, when shorter than the abdomen, and terminating in a transverse line. *Fastigiata*, when of equal or greater length than the abdomen, and terminating in a transverse line. *Serratæ*, when the exterior margin towards the apex is notched or serrated, as in some of the buprestes. *Spinosa*, when their surface is covered with sharp points or prickles. *Scabra*, when their surface is so uneven as to grate against the fingers. *Striata*, when marked with slender longitudinal furrows. *Porcata*, when with elevated longitudinal sulci or ridges. *Sulcatæ*, when these ridges are concave. *Hemelytra*, when the superior wings are of a middle substance betwixt leather and membrane; either totally so, as in the grylli; or partially so, as in the cimices, nepæ, and notonectæ: these are commonly named hemiptera.

Halteres, poisers, (a term also introduced by Linnaeus,) are little heads placed on a stalk or peduncle, most frequently under a little arched scale. They are found only in the class diptera, and appear to be nothing more than the rudiments of the hinder wings.

CAUDA, the Tail, in most insects is, *Simplex*, simple, capable of being extended, and again drawn back at pleasure. In the crab and scorpion, however, it is *Elongata*, elongated, or lengthened out. *Setacea*, bristle-shaped, or taper; as in the raphidea. *Trisetæ*, consisting of three bristles; as in the ephemera. *Furcata*, forked, as in the podura. *Forcipata*, resembling a pair of forceps; as in the forficula. *Foliola*, resembling a leaf; as in the blattæ, grylli, and some species of cancri. *Teliferæ*, armed with a dart or sting; as in the scorpion and panopa. *Aculeus*, the sting, an instrument with which they wound, and at the same time instil a poison; with such the bee, wasp, scorpion, &c. are furnished.

For further illustration of this subject see the following figures of plate XXXVII.

- Fig. 1. **ANTENNÆ PECTINATÆ**, or feathered antennæ; as in the phalænæ, moths.
2. **ANTENNÆ PERFORIATÆ**, or perforiated; as in the dermestor and dytiscus.
3. **ANTENNÆ FISSILES**, or fissile, divided into laminæ at the extremity, as in the scarabæi, beetles.
4. **ANTENNÆ CLAVATÆ**, or club-shaped, as in the papilio, butterfly.
5. **ANTENNÆ MONILIFORMES**, like a necklace of beads; as in the chrysomela.
6. **ANTENNÆ SETACEÆ**, setaceous, or bristle-shaped; as in many of the phalænæ.
7. **ANTENNÆ ARISTATÆ**,

7. **ANTENNA ARISTATÆ**, furnished with a lateral hair, as in the fly.
 8, 9. *a* Caput, the head. *b* Palpi, the feelers. *c* Antennæ, or horns. *d* Oculi, the eyes. *e* Thorax. *f* Scutellum, or escutcheon. *g* Pectus, the breast. *h* Sternum, the breast-bone. *i* Abdomen, and its segments. *k* Anus. *l* Elytra, or shells. *m* Membranous wings. *n* Pêdes, the feet, which are natatorii.
 10. *o* Femur, the thigh. *p* Tibia, or leg. *q* Tarsus, or foot. *r* Unguis, or claw.
 11. *a* The anterior part of the wing. *b* The posterior part. *c* The exterior part. *d* The interior part. *e* The margin. *f* The disk, or middle. *g* Oculi, the eye.
 12, 13, 14, 15, Represent the insect in its egg, caterpillar, pupa, and perfect state.

OF THE METAMORPHOSES OF INSECTS.

All insects, except those of the aptera order, are continually undergoing some transformation. Insects change first from the (ovum) egg, into the (larva) caterpillar or maggot; then into the (pupa) chrysalis; and lastly into the (imago) fly, or perfect state. During each of these changes, their appearance differs as much as night and day. The insect, as soon as it came out of the egg, was by former entomologists called *eruca*; but as this is synonymous with the botanic name *sisymbrium*, it was changed by Linnæus for the term.

LARVA; a name expressive of the insect's being, in this state, as it were, masked, having its true appearance concealed. Under this mask of skin the entire insect, such as it afterwards appears when perfect, lies concealed, enveloped only in its tender wings, and putting on a soft and pulpy appearance; insomuch that Swammerdam was able to demonstrate the butterfly with its wings to exist in a caterpillar, though it bore but a faint resemblance to its future perfection. The insect, therefore, in this state, undergoes little other alteration but the change of its skin. The larvæ are, for the most part, larger than the insect when perfect, and are very voracious. The caterpillar of the cabbage butterfly eats double what it would seem to require from its size; but its growth is not adequate to its voracity.

PUPA. The insect in this state was formerly called chrysalis or aurelia: but as the appearance of gilding is confined to a few butterflies only, the term of pupa has been adopted in its stead; because the lepidoptera, especially, resemble an infant in swaddling clothes; and in this state all, except those of the hemiptera class, take no nourishment.

IMAGO is the third state. This name is given by Linnæus to this third change, in which the insect appears in its proper shape and colours: and as it undergoes no more transformations, it is called perfect. In this state it flies, is capable of propagating its species, and receives true antennæ; which before, in most insects, were scarce apparent. As the shape of the pupa is different in different insects, it assumes different names; thus it is called,

COARCTATA, when it is round, and as it were turned, without the least resemblance of the structure of the insect; as in the diptera.

ORTECTA, when it consists as it were of two parts, one of which surrounds the head and thorax, and the other the abdomen.

INCOMPLETA, when they have wings and feet, but are not capable of moving them; as in most of the hymenoptera.

SEMICOMPLETA, in which they walk or run, but have only the rudiments of wings.

COMPLETA, in which they immediately obtain the perfect form of the insect, without undergoing any more change: as in those of the aptera class, except only the flea. The bed bug also belongs to this class. The spider undergoes frequent transformations, though only in the colour of its skin. The crustaceous insects, as

crabs, lobsters, &c. yearly cast their shells, as their growth would otherwise be impeded. The scolopendri, when young, have fewer feet than when they are full grown. All insects, as soon as they undergo the third change, are arrived at their full growth; nor do we find any difference in the size of the same species of insect in the same countries, unless, during its caterpillar state, it has not had a sufficiency of proper food.

OF THE ORDERS OF INSECTS.

The class of insects is divided by Linnæus into seven orders:

1. The **COLEOPTERA** [from *καλος*, a sheath, and *πτερον*, a wing,] are such insects as have crustaceous elytra or shells, which shut together, and form a longitudinal suture down the back of the insect; as the beetle, *buprestis ignita*, Plate XXXVII. fig. 16.

2. **HEMIPTERA** [from *ημισυ*, half, and *πτερον*,] have their upper wings usually half crustaceous and half membranaceous, not divided by a longitudinal suture, but incumbent upon each other; as the cimex, fig. 17.

3. **LEPIDOPTERA** [from *λεπιδ*, a scale, and *πτερον*,] are insects having four wings, covered with fine scales in the form of powder or meal; as in the butterfly, *papilio antiopa*, fig. 18.

4. **NEUROPTERA** [from *νευρον*, a nerve, and *πτερον*,] have four membranous transparent naked wings, generally like net-work; as in the *panorpa coa*, fig. 19.

5. **HYMENOPTERA** [from *υμενη*, a membrane, and *πτερον*,] are insects with four membranous wings, tail furnished with a sting; as in the *tenthredo*, fig. 20.

6. **DIPTERA** [from *δύω*, two, and *πτερον*,] are such as have only two wings, and poisers; as in the fly, *musca*, fig. 21.

7. **APTERA** [from *α*, without, and *πτερον*,] insects having no wings. This last division contains scorpions, spiders, crabs, lobsters, &c. See **ARANEA**, **CANCER**, &c. To insert here the characters of all the different genera is not necessary, as they will be found in their order in the course of the work.

OF THE TRIVIAL NAMES OF THE VARIOUS SPECIES OF INSECTS.

The trivial names of the various species of insects, subjoined to those of their respective genera occasion little or no controversy. They are current like money, and of the same utility as the proper names of men. Insects living on vegetables should receive their names from the particular plants on which they mostly feed, as that method is preferable to all others. Thus the names of the *coccus cacti*, *phalana mori*, &c. are excellent; and when we are able to give such to insects, the old ones ought to be discarded. But we must be cautious of not being too hasty in our judgement in this respect; as insects, when they cannot get their favourite food, will often eat other plants. Thus the silk-worm, for want of mulberry leaves, will eat those of lettuce, though it will not be so well nourished by them. Various other instances of the invention of trivial names may be met with in the *Systema Naturæ*, particularly among the butterflies and moths. To prevent confusion from the great number of species which constitute the genus of *phalana*, they are distributed into sections, and distinguished by the terms of *bombyces*, *noctuæ*, *geometra*, *tortrices*, *pyralides*, *tineæ*, and *alucitæ*. The *bombyces*, and *noctuæ*, which are so much alike, that the females of the *bombyces* are with great difficulty distinguished from the *noctuæ*, are named promiscuously. All the *geometra* have their names terminating in *aria* and *ata*, according as their antennæ are setaceous or pectinated: The *tortrices*, in *aria*; the *pyralides*, in *alis*; the *tineæ*, in *ella*; and the *alucitæ*, in *dactyla*: so that it is evident from the termination, to what section the insect is to be referred. It were to be wished that similar institutions could be formed throughout the whole science, as here the name itself serves to distinguish the insect.

ENTOYER, in heraldry, denotes a bordure charged wholly with things without life: it seems to be a corruption of the French *entour*, round about.

ENTRE DOURO E MINHO, or **ENTRE-DUERO-E-MINHO**, a province of Portugal, so named from its situation between the rivers Douro and Minho; 60 miles long from N. to S. and 35 broad. The soil is fertile and the air pure.

ENTREPAS, in the manege, a broken pace or going, that is neither walk nor trot, but has somewhat of an amble. This is a pace or gait of such horses as have no reins or back, and go upon their shoulders; or, of such as are spoiled in their limbs.

ENTRE-TAJO-E-GUADIANA, the province of Alentejo. See **ALENTEJO**.

ENTRING LADDERS, in a ship, are of two sorts; one used by the vessel's sides, in a harbour, or in fair weather, for persons to go in and out of the ship: the other is made of ropes, with small staves for steps; and is hung out of the gallery to enter into the boat, or to come aboard the ship, when the sea runs so high that they dare not bring the boat to the ship's side for fear of staving it.

ENTRY, WRIT OF, is a writ directed to the sheriff, requiring him to command the tenant of the land, that he render to the demandant the premises in question, or appear in court on such a day, and shew why he has not done it. Of this writ there are four kinds.

1. A writ of entry *sur disseisin*, that lies for the disseisee against the disseisor, upon a disseisin done by himself; and this is called a writ of entry in the nature of an assise. 2. A writ of entry *sur disseisin in the per*, for the heir by descent, who is said to be in the per, as he comes in by his ancestor. 3. A writ of entry *sur disseisin in the per and cui*, where the feoffee of a disseisor makes a feoffment over to another; and then the form of a writ is, that the tenant had no title to enter but by a prior alienee, to whom the intruder demised it. A writ of entry *sur disseisin in the post*, which lies after a disseisin: the land is removed from hand to hand, in case of a more remote seisin, whereunto the other three degrees do not extend, 1 Inst. 238. But all these writs are now disused, as the title of lands is now usually tried upon actions of ejectment or trespass.

ENTRY AD COMMUNEM LEGEM. The writ of entry *ad communem legem* lies where tenant in dower, or tenant by the courtesy, or for life, aliens in fee, or for the life of another, or in tail, the lands which they hold, &c. after their death, he in the reversion who has it in fee, or for life, shall have this writ against whomsoever is in possession of the land.

ENTRY AD TERMINUM QUI PRATERIIT: a writ of entry *ad terminum qui prateriit*, lies where a man leases lands or tenements for term of life, or years, and afterwards the term expires, and he to whom the lease was made, or a stranger, enters upon the land, and occupies the same, and deforces the lessor; the lessor or his heirs shall have the writ. And this writ lies in the per, cui, and post; for if the lessee holds over his term, and afterwards makes a feoffment, the lessor or heirs may have this writ against the feoffee in the per; and if the feoffee makes a feoffment over, he may have it against the second feoffee in the per and cui, and against the third feoffee in the post.

ENTRY IN CASU CONSIMILI. A writ of entry *in casu consimili* lies where tenant by the courtesy, or for life, or for another's life, aliens in fee, or in tail, or for life; now he in the reversion, who has an estate there for life, or in fee simple, or in tail, shall have that writ during the life of the tenant for life who aliened.

ENTRY IN CASU PROVISIO. The writ of entry *in casu proviso* lies where tenant in dower aliens in fee, for life, or in tail, the land which he holds in dower; he who has the reversion in fee, or in tail, or for life shall maintain that writ against the alienee, and against him who is the tenant of the freehold of land during the life of the tenant in dower, &c. and the writ may be made in the per, cui, and post.

ENTRY CAUSA MATRIMONII PRELOCUTI, lies where lands or tenements are given to a man, on condition that he shall take the donor to his wife within a certain time: and if he do not espouse her within the limited time, or espouse another, or otherwise disable himself, that he cannot take her according to the said condition, then the donor and her heirs shall have the said writ against him, or against whoever else is in the said land.

ENTRY, BILL OF, in commerce, See **BILL**. In making entries inwards, it is usual for merchants to include all the goods they have on board the same ship in one bill, though sometimes they may

happen to be upwards of twenty several kinds; and in case the goods are short-entered, additional or post-entries are now allowed, though formerly the goods so entered were forfeited. As to bills of entry outwards, or including goods to be exported, upon delivering them, and paying the customs, you shall receive a small piece of parchment called a *cocket*, which testifies your payment thereof, and all duties for such goods. If several sorts of goods are exported at once, of which some are free, and others pay customs, the exporter must have two cockets, and therefore must make two entries; one for the goods that pay, and the other for the goods that do not pay custom. Entries of goods on which a drawback is allowed, must likewise contain the name of the ship in which the goods were imported, the importer's name, and time of entry inwards. The entry being thus made, and an oath taken that the customs for those goods were paid as the law directs, you must carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant a warrant, which must be given to the surveyor, searcher, or land-waiter, for them to certify the quantity of goods; after which the certificate must be brought back to the collector and comptroller, or their deputies, and oath made that the said goods are really shipped, and not landed again in any part of Great Britain.

ENVELOPE, in fortification, a work of earth, sometimes in form of a simple parapet, and at others like a small rampart with a parapet: it is raised sometimes on the ditch, and sometimes beyond it.

ENVIRONNE, in heraldry, signifies surrounded with other things: thus, they say, a lion *enveroné* with so many bezants.

ENUMERATION, in rhetoric, a part of peroration; in which the orator, collecting the scattered heads of what had been delivered throughout the whole, makes a brief recapitulation thereof.

ENVOY, a person deputed to negotiate some affair with a foreign prince or state. Those sent from the courts of Britain, France, Spain, &c. to any petty prince or state, such as the princes of Germany, the late republics of Venice, Genoa, &c. go in quality inferior to that of ambassadors; and such a character only do those persons bear, who go from any of the principal courts of Europe to another, when the affair they go upon is not very solemn or important. There are envoys ordinary and extraordinary, as well as ambassadors; they are equally under the protection of the law of nations, and enjoy all the privileges of ambassadors; only differing in this, that the same ceremonies are not performed to them.

EOLIPILE. See **EOLIPILA**.

EON, or **ÆON**. See **ÆON**.

EONIANS, in church history, the followers of Eon, a wild fanatic of the province of Bretagne, in the 12th century, whose brain was disordered. He concluded from the resemblance between eum, in the form for exorcising malignant spirits, viz. *Per eum, qui venturus est judicare vivos et mortuos*, and his own name Eon, that he was the Son of God, and ordained to judge the quick and the dead. He was solemnly condemned by the council at Rheims, in 1148, at which Pope Eugenius III. presided, and ended his days in a miserable prison.

EORIA, in mythology, a feast celebrated by the Athenians in honour of Erigonus, who, by way of punishment, for their not avenging the death of his father Icarus, engaged the gods to inflict this curse on their daughters, that they should love men who never returned their passion.

EOSTRE, in mythology, a goddess of the Saxons, to whom they sacrificed in April, called the month of Eostra; and thence the name of Easter, which the Saxons retained after their conversion to Christianity, applying it to the festival celebrated in commemoration of our Saviour's resurrection.

EPACRIS, a genus of the monogynia order, and pentandria class of plants. Calyx five-parted; corolla monopetalous, tubular, roundish, depressed, quinquelocular, quinquevalvular; capsule, gaping; seeds numerous, small. It has four species, natives of New Zealand.

EPACT, [*ἐπικτη*, from *ἐπαυω*, to intercalate,] a number, whereby we note the excess of the common solar year above the lunar, and thereby may find out the age of the moon every year. For the solar year consisting of 365 days, the lunar but of 354, the lunations every year get 11 days before the solar year; and thereby,

in 19 years, the moon completes 20 times 12 lunations, or gets up one whole solar year; and having finished that circuit, begins again with the sun, and so from 19 to 19 years. For the first year afterwards the moon will go before the sun but 11 days; the second year 22 days; the third 33 days: but 30 being an entire lunation, cast that away, and the remainder three shall be that year's epact; and so on, adding yearly 11 days. Thus to adjust the lunar year to the solar through the whole of 19 years, 12 of them must consist of 12 synodical months each, and 7 of 13, by adding a month of 30 days to every year when the epact would exceed 30, and a month of 29 days to the last year of the cycle, which makes in all 209 days, *i. e.* 19×11 ; so that the intercalary or embolimaean years in this cycle are 4, 7, 10, 12, 15, 18, 19. If the new moons returned exactly at the same time after the expiration of nineteen years, as the council of Nice supposed they would do (when they fixed the rule for the observation of Easter, and marked the new moons in the calendar for each year of the lunar cycle) then the golden number multiplied by 11, would always give the epact. But in a Julian century, the new moons anticipate, or happen earlier than that council imagined they would by $\frac{2}{5}$ of a day. In a Gregorian common century, which is one day shorter than a Julian century, they happen $\frac{17}{25}$ of a day later, ($1 \text{ day} - \frac{2}{5} = \frac{3}{5}$). Now $\frac{17}{25} \times 3 = \frac{51}{25}$ for the three common centuries, but $\frac{2}{5}$ being subtracted, on account of the Gregorian bissextile century, there will remain $\frac{43}{25}$. Therefore in four Gregorian centuries, the new moons will happen later by $\frac{43}{25}$ of a day, and the epacts must be decreased accordingly. At present the Gregorian epact is 11 days short of the Julian epact; but the quotient of the number of the centuries divided by 4, which at this time is 4, multiplied by $\frac{43}{25}$, with the addition of the remainder 1 multiplied by $\frac{17}{25}$, makes in all but $\frac{182}{25}$, or 7 days $+\frac{1}{5}$, therefore $\frac{36}{5}$, *i. e.* 3 days $+\frac{3}{5}$ must be added to complete the 11 days. Whence we have the following general rule for finding the Gregorian Epact for ever. Divide the centuries of any year of the Christian era by 4, (rejecting the subsequent figures.) Let the quotient increased by 2 be multiplied by 43, and the remainder multiplied by 17; divide the sum of these two products by 25, and subtract the quotient from 11 times the golden number, and the remainder, the thirties being rejected, will be the epact.

Example for 1809.

$$\begin{array}{r} 18 \\ - 4, \text{ rem. } 2 \\ 4 \\ 6, (4 + 2) \times 43 = 258 \\ 2 \times 17 = 34 \\ (258 + 34) \div 25 = 11 \\ 11 \times 5 \text{ (Gold. No.)} = 55 \\ 55 - 11 \\ \hline 44 = 1, \text{ rem. } 14 = \text{Epact} \end{array}$$

Examp. 2. To find the epact for the ensuing year of Christ 1811, the golden number for the year being 7.

$$\begin{array}{r} 18 \\ - 4, \text{ and } 2 \text{ over.} \\ 4 \\ 6, (4 + 2) \times 43 = 258 \\ 2 \times 17 = 34 \\ 258 + 34 \\ \hline 292 \\ 25 \\ \hline 267 \\ 11 \times 7, \text{ (golden number,)} = 77 \\ 267 - 77 \\ \hline 190 = 2, \text{ and six over, which remainder will be the epact for the given year.} \end{array}$$

Examp. 3. To find the epact for the year of Christ 2000, the golden number for that year being 6.

$$\begin{array}{r} 20 \\ - 5 \text{ and nothing over.} \\ 4 \\ 7, (5 + 2) \times 43 = 301 \\ 0 \times 17 = 0 \\ 301 \\ \hline 301 \\ 25 \\ \hline 276 \\ 11 \times 6 = 66 \end{array}$$

66 - 12

30 = 1, and 24 over, which will be the epact for the year required.

A shorter rule for finding the epact until the year 1900. Subtract 1 from the golden number; and multiplying the remainder by 11, reject the thirties, and you have the epact.

Example for 1809.

$$\begin{array}{r} 5 \text{ (Gold.No.)} - 1 = 4 \\ (4 \times 11) - 30 = 15 = \text{epact.} \end{array}$$

Example for 1811.

$$\begin{array}{r} 7 \text{ (Gold. Number)} - 1 = 6 \\ (6 \times 11) - 30 = 6; \text{ the epact.} \end{array}$$

Example for 1820.

$$\begin{array}{r} 16 \text{ (Golden Number)} - 1 = 15 \\ (15 \times 11) - 150 = 15, \text{ the epact.} \end{array}$$

EPAMINONDAS, a celebrated Theban, the son of Polymnus, and one of the greatest heroes of antiquity. He studied philosophy under Lysis, a Pythagorean philosopher; was taught music by Dionysius and Olympiodorus: and was from his infancy, inured to all the exercises of body and mind. He was learned, generous, well skilled in war, brave, modest, and prudent; and had such a regard for truth, that he would not tell a falsehood even in jest. He saved the life of Pelopidas, who received in battle seven or eight wounds; and contracted a strict friendship with that general, which lasted till his death. At his persuasion, Pelopidas delivered Thebes from the yoke of the Spartans, who had rendered themselves masters of Cadmea, which occasioned a bloody war between the two nations. Epaminondas being made general of the Thebans, gained the celebrated battle of Leuctra, in which Cleombrotus II. the valiant king of Sparta, was killed. He then ravaged the enemy's country, and caused the city of Messina to be rebuilt and peopled. At length the command of the army was given to another, because Epaminondas had kept his troops in the field four months longer than he had been ordered by the people; but, instead of retiring in disgust, he now served as a common soldier, and distinguished himself by so many brave actions, that the Thebans, ashamed of having deprived him of the command, restored him to his post, in order to carry the war into Thessaly, where his arms were always victorious. A war breaking out between the Elians and the inhabitants of Mantinea, the Thebans took the part of the former. Epaminondas then resolved to endeavour to surprise Sparta and Mantinea; but not succeeding, he gave the enemy battle, in which he received a mortal wound with a javelin, the bearded iron remaining in the wound. Knowing that it could not be drawn out without occasioning immediate death, he would not suffer it to be touched, but continued to give his orders; and on his being told that the enemy were entirely defeated, "I have lived long enough (he cried) since I die without being conquered;" and at the same time he plucked the javelin from his wound, and expired, B. C. 363.

EPANORTHOSIS, in rhetoric, a figure by which a person corrects, or ingeniously revokes, what he just before alledged, as being too weakly expressed, in order to add something stronger, and more conformable to the passion with which he is agitated.

EPARER, in the manege, the flinging of a horse, or his jerking and striking with his hind legs.

EPAULETTES, a kind of shoulder-knots. Those for the soldiers are of the colour of the facing, with a narrow yellow or white tape round it, and worsted fringe; those for the officers are made of gold or silver lace, with a rich fringe; they are badges of distinction worn on one or both shoulders. Those of the dragoon guards, horse, and dragoons, are worn on the left shoulder: the light dragoons, and officers of grenadiers, have one on each shoulder; those of the battalion wear one on the right shoulder only, made of embroidery or lace with a gold or silver fringe. Those of the royal regiment of artillery are of gold and embroidery, with gold fringe on scarlet cloth, and worn on the right shoulder.

EPAULEMENT, [French, from *epaule*, a shoulder,] in fortification, a sidework made either of earth thrown up, of bags of earth, gabions, or of fascines and earth. It sometimes denotes a semibastion, and a square orillon, or mass of earth faced and lined with a wall, designed to cover the cannon of a cazemate.

EPENTHESIS, [επειθεσις,] in grammar, the addition of a vowel or consonant in the middle of a word.

EPERIES,

EPERIES, a town of Hungary, in the county of Saros, famous for salt mines, 20 miles N. of Cassovia.

EPERNAY, an ancient and handsome town of France, in the department of Marne, and late province of Champagne; famous for its wines and cloth manufacture. It is 17 miles N.W. of Châlons sur Marne.

EPEUS, a descendant of Endymion, the inventor of the battering ram, an engine of great service in sieges to make a breach. He is said to have built the Trojan horse, and founded the city Metapontum.

EPHA, or **EPHAH**, [עֲפָה, Heb.] a dry measure among the Jews, equal to three pecks, three pints, twelve and four-tenths inches. Also a liquid measure equal to four gallons, two pints, and fifteen inches.

EPHEBÆUM, in antiquity, the place where the ephebi or youth exercised.

EPHEBI, among the ancient Athenians, a designation given to their young men when they are arrived at eighteen years of age, at which time they had their names entered in a public register.

EPHEDRA, a genus of the monodelphia order, and diccia class of plants; natural order Coniferae. Male calyx bifid; no corolla; stamina seven; antheræ four, inferior, three superior; female, calyx four, bipartite, five-fold, one upon another; no corolla; pistils two; seeds two, covered by the calyx, resembling a berry. It has two species, natives of Russia.

EPHEMERA, [ἐφήμερη.] 1. A fever that terminates in one day. 2. An insect that lives only one day.

EPHEMERA, the **DAY FLY**, in entomology, a genus of the order neuroptera. Mouth without mandibles; feelers four, very short, filiform; antennæ short, filiform; above the eye are two or three large stemmata; wings erect, the lower ones much shorter; tail terminating in long bristles or hairs. These short-lived animals, of which there are about twenty species, in two divisions, according as they have two or three hairs in the tail, are found every where about waters in the summer. They take their name from the shortness of their life, and are distinguished into several species. Some live several days, others do not take flight till the setting of the sun, and live not to see the rising luminary. Some exist but one hour, others but half that time; in which short period they comply with the call of nature. With respect to those which live several days, there is a peculiarity observed, incident to them alone. They have to cast off one slough more, an operation which sometimes takes twenty-four hours to complete. To bring this about, they cling fast to a tree. The ephemera, before they flutter in air, have in some respect been fishes. They remain in the states of larva and chrysalis for one, two, or three years. The chrysalis only differs from the larva by having cases for wings on its back. Both have on their sides small fringes of hair, which, when put into motion, serve them as fins. Nothing can be more curious than the plying of those little oars in the water. Their abdomen is terminated, as well as in their state of flies, by three threads. These larvæ scoop out dwellings in the banks of rivers; small tubes made like siphons, the one serving for an entrance, the other affording them an outlet. The banks of some rivers are often perforated with them. When the waters decrease, they dig fresh holes lower down, to enjoy their element the water. The season and hour, when the chrysalids of the different species of the ephemera turn into flies, maintain a kind of regularity. The heat, the rise or fall of the waters, accelerate, however, or postpone their final display. The ephemera of the Rhine appear in the air two hours before sunset. These flies are hatched almost all at the same instant in such numbers as to darken the air. The most early of those on the Marne and Seine in France, do not begin to fly till two hours after sunset, in the middle of August. They are seen fluttering and sporting on the brink of their tomb. The glare of light attracts them, round which they perform a thousand circles with amazing regularity. See Plate XXXVII.

EPHEMERIS, [ἐφημερίς.] 1. A journal; an account of daily transactions. 2. An account of the daily motions and situations of the planets.

EPHEMERIS, [ἐπί, and ἡμέρα, a day,] in astronomy, a table calculated to shew the state of the heavens for every day at noon; or the places wherein all the planets are found at that time. From these tables the eclipses, conjunctions, and aspects, of the planets, are determined; horoscopes or celestial schemes constructed, &c.

Origan, Kepler, Argoli, Heckerus, Mezzaracchis, Wing, Dela Hire, Parker, &c. have published ephemerides. S. Cassini has calculated ephemerides of the sidera medicæ, or satellites of Jupiter, which are of good use in determining the longitude. In England, the Nautical Almanac, or Astronomical Ephemeris, published annually by anticipation, under the direction of the commissioners of longitude, is the most considerable. In France, celestial ephemerides were published by M. Desplaces every ten years, from 1715, to 1745: they were afterwards continued by the Abbé Caille, with many additions; of which an account may be seen in the History of the Academy of Sciences, for 1743. That academy have likewise published annually, from the beginning of the present century, a kind of ephemeris, under the title of Connoissance des Temps. White's ephemeris is also a very useful work for the practical astronomer.

EPHESIA, a festival held at Ephesus in honour of Diana.

EPHESTIA, in antiquity, a festival in honour of Vulcan, wherein three young men ran for a prize.

EPHESTRIA, feasts celebrated at Thebes in honour of Tiresias.

EPHESUS, an ancient city of Ionia, much celebrated on account of its temple of Diana, and for being the most famous mart of Asia Minor, as well as the metropolis of all Asia. Stephanus gives it the title of Epiphanestate, or most illustrious; and Pliny styles it the ornament of Asia. The ancient city stood about 50 miles south of Smyrna, near the mouth of the river Cayster, and the shore of the Icarian sea, which is a bay of the Ægean; but it has been so often destroyed and rebuilt, it is no easy matter to determine the precise place. Most of our modern travellers are of opinion, that the ancient city stood more to the south than the present; which they argue from the ruins that still remain. Ephesus was anciently known by the different names of Alopes, Ortygia, Mörge, Smyrna, Trachæa, Samornion, and Ptelea. It was called Ephesus, according to Heraclides, from Ἐφεσος, permission; because Hercules (says he) permitted the Amazons to live and build a city in that place. Others tell us, that Ephesus was the name of the Amazon that founded the city; for Pliny, Justin, and Orosius, unanimously affirm that it was built by an Amazon; while others bestow this honour upon Androclus, the son of Codrus, king of Athens, who was the chief of the Ionians that settled in Asia. But in matters of so early a date, it is impossible to come at the truth. What we know for certain is, that the city, which in the Roman times was the metropolis of all Asia, acknowledged Lysimachus for its founder; for that prince having caused the ancient city to be entirely demolished, rebuilt, at a vast expence, a new one, in a place more convenient, and nearer the temple. Ephesus is now called Ajasaloue, and still exhibits many relics of its ancient grandeur. It is seated near a gulph of the same name, and, according to some modern travellers, has still a good harbour, 40 miles S. of Smyrna. Lon. 27. 33. E. Lat. 37. 48. N.

EPHETÆ, [from ἐφίημι, I send forth,] in antiquity, magistrates among the Athenians, instituted by king Demophoon, to take cognizance of murder, man-slaughter, and chance-medley.

EPHIELIS, in botany, a genus of the octandria monogynia class and order. Calyx five-parted; petals five, with claws; necessary ten scales, two to each petal; capsule oblong, one-celled, two-valved, two-seeded. One species, viz. *E. guianensis*, a lofty tree, growing in the forests of Guiana.

EPHOD, [עֶפֶד,] a sort of ornament worn by the Hebrew priests. That worn by the high priest was richly composed of gold, blue, purple, crimson; and twisted cotton; and upon the part which came over his two shoulders, were two large precious stones, upon which were engraven the names of the twelve tribes of Israel, upon each stone six names. Where the ephod crossed the high priest's breast was a square ornament, called the breast-plate; in which twelve precious stones were set, with the names of the twelve tribes of Israel engraved on them, one on each stone. The ephods worn by the other priests were of plain linen. *Calmet.*

EPHORI, in Grecian antiquity, magistrates established by Lycurgus in ancient Sparta to balance the regal power. The authority of the ephori was very great. They sometimes expelled, and even put to death, the kings, and abolished or suspended the power of the other magistrates, calling them to an account at pleasure. There were five of them, or, as others say, nine. They presided in the

the public shews and festivals. They were entrusted with the public treasure; and made war and peace; and were so absolute, that Aristotle makes their government equal to the prerogative of a monarchy.

EPHORUS, an orator and historian of Cumæ in Æolia, about B. C. 352. He was disciple to Isocrates, by whose advice he wrote an history of all the battles between the Greeks and Barbarians, for 750 years. It was greatly esteemed by the ancients; but is now lost.

EPHRAIM, [אפרים, Heb. *i. e.* fruitful,] the second son of the patriarch Joseph, and the progenitor of one of the tribes of Israel, was born about A. M. 2293.

EPHRAIM, in ancient geography, one of the divisions of Palestine by tribes. Ephraim and the half-tribe of Manasseh are blended together by the sacred writer; and it only appears that Ephraim occupied the more southern, and the half-tribe of Manasseh the more northern parts, but both seem to have extended from the Jordan to the sea.

EPHREM, St. an ancient Christian writer, in the fourth century, deacon of Edessa, was born at Nisibe, in Syria, hence styled Syrus. He was greatly esteemed by St. Basil, and St. Gregory of Nice, and other great men. He wrote against the opinions of Sabellius, Arius, Apollinarius, the Manichees, &c. and acquired such reputation by his virtue and his works, that he was called the doctor and the prophet of the Syrians. He died in 378. The best editions of his works are, that of Oxford, in 1708 in folio, and that of Rome, from 1732 to 1736, in Syriac, Greek, and Latin, 6 vols. folio.

EPHYDOR, in antiquity, an officer in the Athenian courts of justice, who provided the plaintiff and defendant with equal water hour-glasses. When the glass was run out, they were not permitted to speak any further; and, therefore, we find them very careful not to lose or mispend one drop of their water. Whilst the laws quoted by them were reciting, or if any other business intervened, the glasses were stopped.

EPIBATÆ, [ἐπιβαταί,] among the Greeks, marines, or soldiers, who served on board the ships of war. They were armed in the same manner as the land-forces, only that many of them wore heavy armour.

EPIBATERION, [from ἐπιβαίνω, to go abroad,] a poetical composition, in use among the Greeks, rehearsed at a person's return from a voyage, thanking the immortal gods for his preservation.

EPIBATERIUM, a genus of the hexandria order, and monœcia class of plants. Calyx double, outward one six-leaved, very small; inner one three-leaved, large; corolla six-petaled; drupes three, roundish, monospermous; seed a kidney-shaped compressed nut, somewhat furrowed. One species.

EPIC, [ἐπικός, Latin; *επος*,] narrative; comprising narrations, not acted, but rehearsed. It is usually supposed to be heroic, or to contain one great action achieved by a hero.

EPIC, or **HEROIC POEM**, a poem expressed in narration, formed upon a story partly real and partly feigned; representing in a sublime style, some signal and fortunate action, distinguished by a variety of great events, to form the morals, and affect the mind with the love of heroic virtue. We may distinguish three parts of the definition, namely, the matter, the form, and the end. The matter includes the action of the fable, under which are ranged the incidents, episodes, characters, morals, and machinery. The form comprehends the way or manner of the narration, whether by the poet himself, or by any persons introduced, whose discourses are related: to this branch likewise belong the moving of the passions, the descriptions, discourses, sentiments, thoughts, style, and versification; and besides these, the similes, tropes, figures, and, in short, all the ornaments and decorations of the poem. The end is to improve our morals and increase our virtue. See **POETRY**.

EPICEDION, [from ἐπι, upon, and κηδος, funeral,] in Greek and Latin poetry, a poetical composition, on the death of a person. At the obsequies of any man of figure, there were three kinds of discourses usually made; that rehearsed at his bustum or funeral pile, was called *nenia*; that engraven on his tomb, epitaph; and that spoken in the ceremony of his funeral, *epicedion*.

EPICHIREMA, [ἐπιχειρημα,] in logic, a mode of reasoning, which comprehends the proof of one or both the premises of a syllogism, before the conclusion is drawn.

EPICHIROTONIA, among the Athenians. It was ordained by Solon, that once every year the laws should be carefully revised and examined; and if any of them were found unsuitable to the present state of affairs, they should be repealed. This was called *ἐπιχειροτονια των νομων*, from the manner of giving their suffrages by holding up their hands. See Potter's *Archæol. Græc.* lib. 1. cap. 26. tom. i. p. 142.

EPICHRYSUM, in botany, a genus of the cryptogamia fungi class and order. Fungus rounded, concave; seeds globular; tailless, attached to a branched thread creeping within. It has one species, viz. *E. argenteum*.

EPICENE, in grammar, a term applied to nouns, which, under the same gender and termination, mark indifferently the male and female species. Such in Latin is *aquila, vespertilio*, &c. which signify equally a male or female eagle or bat. Grammarians distinguished between *epicene* and common. A noun is said to be common of two kinds, when it may be joined either with a masculine or a feminine article; and *epicene*, when it is always joined to one of the two articles, and yet signifies both genders.

EPICETETUS, a celebrated Stoic philosopher, born at Hierapolis in Phrygia, in the first century, was the slave of Epaphroditus, a freed man and one of Nero's guard. Domitian banishing all philosophers from Rome, about A. D. 94, Epictetus retired to Nicopolis in Epirus, where he died in very advanced age; and after his death, the earthen lamp he used had sold for 3000 drachmas. He was a man of great modesty; which was eminent in his practice, as well as in his recommendation to others; hence he used to say, "That there was no need of adorning a man's house with rich hangings or paintings, since the most graceful furniture is temperance and modesty, which are lasting ornaments, and will never be the worse for wearing." Of all the ancient philosophers, he seems to have made the nearest approaches to the Christian morality, and to have had the most just ideas of God and providence. He always possessed a cool and serene mind, unruffled by passion; and was used to say, that the whole of moral philosophy was included in these words, support and abstain. One day his master Epaphroditus strove in a frolic to wrench his leg; when Epictetus said, with a smile, and free from emotion, "If you go on, you will certainly break my leg." but the former redoubling his effort, and striking it with all his strength, he at last broke the bone; when all the return Epictetus made was, "Did not I tell you, Sir, that you would break my leg?" No man was more expert at reducing the rigour of the maxims of Stoics into practice. He conformed himself strictly, both in his discourse and behaviour, to the manners of Socrates and Zeno. He waged continual war with fancy and fortune; and it is an excellence peculiar to him, that he admitted all the severity of the Stoics without their sourness, and reformed Stoicism as well as professed it. Besides vindicating the immortality of the soul as strenuously as Socrates, he declared openly against suicide, the lawfulness of which was maintained by the rest of the sect. Arrian, his disciple, wrote a large account of his life and death, which is lost; and preserved four books of his discourses and his *Enchiridion*, of which there have been several editions in Greek and Latin; and, in 1758, a translation of them into English was published by the learned and ingenious Miss Carter.

EPICUREAN, one who holds the physiological principles of Epicurus.

EPICUREAN PHILOSOPHY, the doctrine or system of philosophy maintained by Epicurus and his followers. It consisted of three parts; canonical, physical, and ethereal. The first was about the canons or rules of judging. The censure which Tully passes upon him for his despising logic, will hold true only with regard to the logic of the Stoics, which he could not approve of, as being too full of nicety and quirk. Epicurus was not acquainted with the analytical method of division and argumentation, nor was he so curious in modes and formation as the Stoics. Soundness and simplicity of sense, assisted with some natural reflections, was all his art. His search after truth proceeded only by the senses; to the evidence of which he gave so great a certainty, that he considered them as an infallible rule of truth, and termed them the first natural light of mankind. In the second part of his philosophy, he laid down atoms, space, and gravity, as the first principles of all things; he did not deny the existence of God, but which is equally absurd and wicked, thought it beneath his majesty to concern himself with human affairs; he held him a blessed immortal Being, having

having no affairs of his own to take care of, and above meddling with those of others. As to his ethics, he made the supreme good of man to consist in pleasure, and consequently supreme evil in pain. Nature itself, says he, teaches us this truth; and prompts us from our birth to procure whatever gives us pleasure, and to avoid what gives pain. To this end he proposes a remedy against the sharpness of pain: this was to divert the mind from it, by turning our whole attention upon the pleasures we have formerly enjoyed. He held that the wise man must be happy, as long as he is wise: the pain, not depriving him of his wisdom, cannot deprive him of his happiness. Gassendus pretends, that the pleasure, in which this philosopher has fixed the sovereign good, was nothing else but the highest tranquillity of mind, in conjunction with the most perfect health of body: but Tully, Horace, and Plutarch, as well as almost all the fathers of the church, give us a very different representation: indeed the nature of this pleasure, in which the chief happiness is supposed to be seated, is a grand problem in the morals of Epicurus. Hence there were two kinds of Epicureans, the rigid and the remiss: the first were those who understood Epicurus's notion of pleasure in the best sense, and placed all their happiness in the pure pleasures of the mind, resulting from the practice of virtue: the loose or remiss Epicureans, taking the words of that philosopher in a gross sense, placed all their happiness in bodily pleasures, or debauchery.

EPICURUS, the greatest philosopher of his age, was born at Gargettium in Attica, about B. C. 340, in the 109th Olympiad. He settled at Athens in a fine garden he had bought; where he lived with his friends in great tranquillity, and educated a great number of disciples. They all lived in common with their master. The respect which his followers paid to his memory is admirable: his school was never divided, but his doctrine was followed as an oracle. His birth-day was still kept in Pliny's time; the month he was born in was observed as a continual festival; and they placed his picture every where. He wrote many books, and valued himself upon making no quotations. He raised the atomical system to a great reputation, though he was not the inventor of it, but had only made some change in that of Democritus. As to his doctrine concerning the supreme good or happiness, it was very liable to be misrepresented, and some ill effects proceeded from thence, which discredited his sect. He was charged with perverting the worship of the gods, and inciting men to debauchery; but he did not forget himself on this occasion: he published his opinions to the world: he wrote some books of devotion; recommended the veneration of the gods, sobriety, and chastity; and it is certain that he lived in an exemplary manner, and conformably to the rules of philosophical wisdom and frugality. Timocrates, a deserter of his sect, spoke very scandalously of him. Gassendus has given us all he could collect from the ancients concerning the person and doctrine of this philosopher. He died of a suppression of urine, aged 72.

EPICYCLE, [*ἐπικύκλιος* and *ἐπικύκλιος*], in the ancient astronomy, a little circle whose centre is in the circumference of a greater circle; or it is a small orb, or sphere, which being fixed in the deferent of a planet, is carried along with it; and yet, by its own peculiar motion, carries the planet fastened to it round its proper centre. It was by means of epicycles that Ptolemy and his followers solved the various phenomena of the planets, but more especially their stations and retrogradations. The great circle they called the eccentric or deferent, and along its circumference the centre of the epicycle was conceived to move; carrying with it the planet fixed in its circumference, which in its motion downwards proceeded according to the order of the signs, but, in moving upwards, contrary to that order. The highest point of a planet's epicycle they called apogee, and the lowest perigee. See **APOGEE** and **PERIGEE**.

EPICYCLOID, [*ἐπικυκλίδης*], in geometry, a curve generated by the revolution of the periphery of a circle, **ACE**, Plate LIV. fig. 17, along the convex or concave side of the periphery of another circle, **DGB**. The length of any part of the curve, that any given point in the revolving circle has described, from the time it touched the circle it revolved upon, shall be to double the versed sine of half the arch, which all that time touched the circle at rest, as the sum of the diameters of the circles, to the semi-diameter of the resting circle, if the revolving circle moves upon the convex side of the resting circle; but if upon the concave side, as the difference of the diameters to the semi-diameter of the resting

circle. In the Philosophical Transactions, No. 218, we have a general proposition for measuring the areas of all cycloids and epicycloids, viz. The area of any cycloid or epicycloid is to the area of the generating circle, as the sum of double the velocity of the centre and velocity of the circular motion, to the velocity of the circular motion: and, in the same proportion, are the areas of segments of those curves to those of analogous segments of the generating circle.

EPIDAUROM, **EPIDAUROS**, or **EPITAUROM**, in ancient geography, a town of Dalmatia, on the Adriatic.

EPIDAUROS, in ancient geography, a town of Argolis, in Peloponnesus, on the Saronic bay, S. of the promontory **Spiræum**; called sacred, because of the religious veneration paid to **Æsculapius**, whose temple stood five miles from the town.

EPIDEMIA, in Grecian antiquity, festivals kept in honour of Apollo and Diana, at the stated seasons, when those deities, who could not be present every where, were supposed to visit different places, in order to receive the vows of their adorers.

EPIDEMICAL, or **EPIDEMIC**, [*ἐπιδημικός*], in general, denotes a spreading disorder, which, as is supposed, arises from some corruption or malignity in the air, and attacks great numbers of people at certain seasons. Mankind have always been more inclined to search for the most distant causes, in order to explain physical events, rather than to avail themselves of those which are within their reach. Thus the yellow-fever, which in 1793 ravaged the city of Philadelphia, was doubtless generated by the immense quantities of damaged coffee, and other putrescible substances, exposed in the heat of summer on the muddy banks of the river. In like manner the plague, which formerly destroyed great numbers in London, was not always imported, but probably originated at home, where, in those ages, cleanliness was not so generally attended to as it is at present. Hence this domestic virtue has guarded us against many epidemics, to which other less cleanly nations have been subject. But there is still great occasion for improvements, especially in the houses of the narrow courts and alleys of the metropolis.

EPIDENDRUM, a genus of the diandria order, and gynandria class of plants; natural order, Orchideæ. Nectary turbinate, oblique, reflex; corolla spreading; spur none. There are 124 species. This numerous genus is obscure in its character, differences, and synonyms; for the flowers in dried specimens can hardly be unfolded. These plants are natives of America, and the East Indies.

EPIDERMIS, [*ἐπιδερμῖς*], the same with cuticle. See **ANATOMY** and **CUTIS**.

EPIDICASIA, among the Athenians. Daughters inheriting their parents estate, were obliged to marry their nearest relation; which gave occasion to persons of the same family to go to law with one another, each pretending to be more nearly allied to the heiress than the rest. The suit was called *ἐπιδικασίας δίκη*, and the virgin, about whom the relations contested, *ἐπιδίκασ*.

EPIDOTÆ, deities who presided over the growth of children; worshipped by the Lacedæmonians, and invoked by those who supposed themselves persecuted by ghosts, &c.

EPIGÆA, in botany, a genus of the monogynia order, and decandria class; natural order, Bicornes. Calyx, outer three-leaved; inner five-parted; corolla salver-form; capsule five-celled. Two species, viz. *E. repens*, creeping epigæa, or trailing arbutus, and *E. cordifolia*, heart-leaved epigæa; the former is a native of Virginia and Canada, and the latter of Guadaloupe.

EPIGLOTTIS, one of the cartilages of the larynx or wind-pipe. See **ANATOMY**.

EPIGRAM, [*ἐπιγραμμα*], originally signifies inscription. Epigrams derive their origin from those inscriptions placed by the ancients on their tombs, statues, temples, triumphal arches, &c. These, at first, were only simple monograms: afterwards increasing their length, they made them in verse, to be the more easily retained. Herodotus, and others, have transmitted to us several of them. Such little poems retained the name of epigrams, even after the design of their first institution was varied, and the people began to use them for the relation of little facts and accidents, the characterizing of persons, &c. The point is a quality much insisted on by the critics, who require the epigram constantly to close with something poignant and unexpected, to which all the rest of the composition is only preparatory; while others, on the contrary exclude the point, and require the thought to be equally diffused

diffused throughout the poem, without laying the whole stress on the close; the former is usually Martial's practice, and the latter that of Catullus. The Greek epigrams have scarce any thing of the point or briskness of the Latin ones: those collected in the Anthology, have most of them a remarkable air of ease and simplicity, attended with something just and witty: such as we find in a sensible peasant, or a child that has wit. They have nothing that bites, but something that tickles. Though they want the salt of Martial, yet to a good taste they are not insipid; except a few of them, which are quite flat and spiritless. However the general faintness and delicacy of the pleasantries in them, has given occasion for a Greek epigram, or epigram à la Grecque, to denote, among the French, an epigram void of sharpness. The epigram admits of a great variety of subjects: some are made to praise, and others to satirize; which last are much the easiest, ill-nature serving instead of point and wit. Boileau's epigrams are all satires on one or another; those of Des Reaux are all in honour of his friends; those of Buchanan are partly satirical, partly panegyrical; and those of Mad. Scudery are so many eulogies. The epigram being only a single thought, it would be ridiculous to express it in a great number of verses.

EPILEPSY, [*επιληψία*], a convulsion, or convulsive motion of the whole body, or of some of its parts, with a loss of sense. A convulsive motion happens when the blood, or nervous fluid, runs into any part with so great violence, that the mind cannot restrain them. Quincy.

EPILEPSY, or **FALLING-SICKNESS**, as it is also called, though hitherto considered an incurable disease, has often been relieved by the conjoint power of medicines and an appropriate diet. Hence, a pure and fresh air, light but nutritive food; cheerful company, and moderate exercise, will be here of greater service than the most celebrated nostrums, which are daily imposed upon the credulous. On the other hand, epileptic patients should carefully avoid all strong and heating, as well as hot liquors, which equally relax the stomach: abstain from swine's flesh, very fat meat, game, water-fowl, salted or pickled provisions, and likewise from oily and watery vegetables: hence they ought not to eat nuts, nor cabbages, greens, &c. See **MEDICINE**.

EPILOBIUM, the **WILLOW-HERB**: in botany, a genus of the monogynia order, and octandria class of plants: natural order, Calycanthemæ. Calyx four-cleft; petals four; capsule oblong, inferior; seeds downy. There are fourteen species. These plants are hardy perennials, commonly considered as weeds.

EPILOGUE, in oratory, the conclusion of a discourse, ordinarily containing a recapitulation of the principal matter delivered.

EPILOGUE, **THE**, in dramatic poetry, is addressed to the audience, after the play is over, by one of the principal actors; and usually contains some reflections on certain incidents in the play, especially those in the part of the person that speaks it. Having somewhat of pleasantry, it is intended to compose the passions excited by the representation; a practice which is ridiculed by the Spectator; and compared to a merry tune upon the organ after a good sermon, to wipe away any impressions that might have been made thereby.

EPIMEDIUM, **BARREN-WORT**: a genus of the monogynia order, and tetrandria class of plants; natural order, Corydæles. Nectary four, cupform, leaning on the petals; corolla four-petaled; calyx very caducous; fruit a silique. One species, viz. *E. alpinum*, alpine barrenwort.

EPIMENIDES, an ancient poet and philosopher, by some stiled a Phœstian; by others said to have been born at Gnossus in Crete. Contrary to the custom of his country, he always wore his hair long; which, according to some, was because he was ashamed of being thought a Cretan: and indeed he does not seem to have had a high opinion of his countrymen, if that verse cited by St. Paul be, as is generally believed to be, his; "The Cretans are always liars, evil beasts, slow bellies." His reputation was so great over all Greece, that he was esteemed a favourite of the gods. The Athenians being afflicted with the plague, and commanded by the oracle to make a solemn lustration of the city, sent Nicias the son of Niceratus, with a ship to Crete, to desire Epimenides to come to them. He accepted their invitation, accompanied the messengers to Athens, performed the lustration of the city, and the plague ceased. Here he contracted an acquaintance with Solon, whom he privately instructed in the proper method

for the regulation of the Athenian commonwealth. Having finished his business at Athens, the citizens offered him many valuable presents and high honours, and appointed a ship to carry him back to Crete; but he would accept of nothing except a little branch of the sacred olive preserved in the citadel; and desired the Athenians to enter into an alliance with the Gnosians. Having obtained this he returned to Crete; where he died soon after, aged 157 years; or as the Cretans, consistently with their character, pretended, 299. He was a great poet, and wrote 5000 verses on the Genealogy of the gods, 6500 on the building of the ship Argo, and Jason's expedition to Colchis, and 4000 concerning Minos and Rhadamanthus. He wrote also in prose, Concerning Sacrifices and the Commonwealth of Crete. St. Jerom likewise mentions his Book of Oracles and Responses. The Lacedæmonians procured his body, and preserved it among them by the advice of an oracle; and Plutarch tells us, that he was reckoned the 7th wise man by those who refused to admit Periander into the number.

EPIMETHEUS, in fabulous history, a son of Japetus and Clymene, one of the Oceanides, who married Pandora, by whom he had Pyrrha, the wife of Deucalion. He had the curiosity to open the box which Pandora had brought with her, and from thence issued a train of evils, which from that moment have never ceased to afflict the human race. Hope only remained at the bottom of the box, not having a sufficient time to escape, and it is she alone which comforts men under misfortunes. Epimetheus was changed into a monkey by the gods, and sent into the island Pithecusa.

EPINAL, a town of France, in the department of Vosges, and late province of Lorraine; 35 miles S. E. of Nancy.

EPIPHANIUS, Sr. an ancient father of the church, born at Besanducan, a village in Palestine, about A. D. 332. He founded a monastery near the place of his birth, and presided over it. He was afterwards elected bishop of Salamis; when he took part with Paulinus in opposition to Meletius, and ordained in Palestine, Paulinian the brother of St. Jerom; on which a contest arose between him and John bishop of Jerusalem. He afterwards called a council in the island of Cyprus, in which he procured a prohibition of the reading of Origen's writings; and made use of all his endeavours to prevail on Theophilus bishop of Alexandria to engage St. Chrysostom to declare in favour of that decree: but not meeting with success, he went himself to Constantinople, where he would not have any conversation with St. Chrysostom; and formed the design of entering the church of the apostles, to publish his condemnation of Origen; but being informed of the danger to which he would be exposed, he resolved to return to Cyprus: but died at sea, in 403. His works were printed in Greek, at Basil, 1544, in folio; and were afterwards translated into Latin, in which language they have been often reprinted. Petavius revised and corrected the Greek text by two manuscripts, and published it together with a new translation at Paris in 1622. This edition was reprinted at Cologne in 1682.

EPIPHANY, [*επιφάνεια*], a Christian festival, otherwise called the manifestation of Christ to the Gentiles, observed on the sixth of January, in honour of the appearance of our Saviour to the three magi, or wise men, who came to adore him, and bring him presents. The feast of epiphany was not originally a distinct festival, but made a part of that of the nativity of Christ, which being celebrated twelve days, the first and last of which were high or chief days of solemnity, either of these might properly be called epiphany, as that word signifies the appearance of Christ in the world. The kings of England and Spain offer gold, frankincense, and myrrh, on epiphany, or twelfth day, in memory of the offerings of the wise men to the infant Jesus. The festival of epiphany is called by the Greeks the feast of lights, because our Saviour is said to have been baptized on this day; and baptism is by them called illumination.

EPIPHONOMENA. See **ACCLAMATION** and **ORATORY**.

EPIPHORA, [*επιφορα*], an inflammation of any part, but more especially a refluxion of humours on the eyes.

EPIPHYLLOSPERMOUS, [from *επι*, πολλοι and *σπερμα*], is applied to plants that bear their seed on the back part of their leaves.

EPIPHYSIS, [*επιφύσις*], accretion; the part added by accretion; one bone growing to another by simple contiguity, without any proper articulation. See **ANATOMY**.

EPILOCE.

EPIPOLOCE, [*ἐπιπόλοσις*], a figure of rhetoric, by which one aggravation, or striking circumstance, is added in due gradation to another; as, he not only spared his enemies, but continued them in employment; not only continued, but advanced them.

EPIPOLOCELE, in medicine, a kind of hernia or rupture, in which the omentum subsides into the scrotum.

EPIPOLOMPHALON, an hernia umbilicalis, proceeding from the omentum falling into the region of the navel.

EPIRUS, a district of ancient Greece, bounded on the E. by Etolia, on the W. by the Adriatic, on the N. by Thessaly and Macedonia, and on the S. by the Ionian sea. It was anciently governed by its own princes, in which state it made a considerable figure. According to Josephus, it was first peopled by Dodanim the son of Javan, and grandson of Japhet.

EPISCOPACY is that form of church government, in which diocesan bishops are established as distinct from and superior to priests or presbyters. The ministers of religion have long been distinguished into different orders; but it has been much controverted whether the distinction be of divine or human right. This controversy commenced soon after the Reformation; and has been agitated with great warmth between the Episcopalians on the one side, and the Presbyterians and Independents on the other.

EPISCOPALIANS, in church history, an appellation given to those who prefer the episcopal government and discipline to all others. By the test act, none but Episcopalians, or members of the church of England, are qualified to enjoy any office civil or military: an act which every liberal-minded person must allow to be a disgrace to the laws of England, as long as it remains unrepealed. The inconvenience arising from it, even to the conscientious part of the English clergy themselves, has been unanswerably set forth by Mr. Beaufort in the House of Commons, in 1787.

EPISCOPIUS, SIMON, one of the most learned men of the 17th century, and the chief supporter of the Arminian sect, was born at Amsterdam in 1583. In 1612, he was chosen professor of divinity at Leyden, in the room of Gomarus, who resigned; and the functions of his office, with his private studies, were light burdens to him, compared with the difficulties he sustained on account of the Arminian controversy: which, though it began in the universities, soon flew to the pulpits, from whence it spread and inflamed the people. The states of Holland having invited Episcopius to take his place at the synod of Dort, he went thither accompanied by some remonstrant ministers; but the synod would not allow them to sit as judges, nor to appear in any other capacity than as persons summoned before them: they submitted, were deposed, and banished. They then retired to Antwerp, but the times growing more favourable, Episcopius returned to Holland in 1626, and was made minister of the church of Remonstrants at Rotterdam. In 1634, he was chosen rector of the college founded by his sect at Amsterdam, where he spent the remainder of his days. He died in 1643, of a retention of urine. His works make two volumes in folio, of which the 2d consists of posthumous publications.

EPISCOPUS. See BISHOP.

EPISODE, [*ἐπισῳδή*], an incidental narrative, or digression in a poem, separable from the main subject, yet rising naturally from it. All the particular incidents whereof the action or narration is compounded, are called episodes. See POETRY.

EPISPASTICS, [*ἐπι and σπασω*], in medicine, are topical remedies, which being applied to the external parts of the body, attract the humours to them.

EPISTATE, in the Athenian republic, the president of the Proedri.

EPISTEMONARCH, in the ancient Greek church, an officer of great dignity, who had the care of every thing relating to faith, in the quality of censor.

EPISTLE, [*ἐπιστολή*], a letter. This word is now chiefly used in speaking of ancient writings, as the epistles of St. Paul, epistles of Cicero, epistles of Pliny, &c.

EPISTLES AND GOSPELS, in the liturgy of the church of England, are select portions of scripture, taken out of the writings of the evangelists and apostles, and appointed to be read, in the communion service, on Sundays and holidays. They are thought to have been selected by St. Jerom, and by him put in the lectionary. It is certain, they were very anciently appropriated to the days whereon they are now read, as they are commented upon

in the homilies of several ancient fathers, preached upon those days, to which these portions of scripture are now affixed.

EPISTROPHE, in rhetoric, a figure, wherein that which is supposed of one thing, is strongly affirmed of another: thus, Are they Hebrews? so am I. Are they Israelites? so am I. Are they of the seed of Abraham? so am I, &c.

EPISTYLE, [from *ἐπί*, over, and *στυλος*, a column,] in the ancient architecture, is a mass of stone, or a piece of timber laid upon the capital of a column. It is now called architrave. See ARCHITECTURE.

EPITAPH, [*ἐπί*, upon, and *τάφος*, a sepulchre,] an inscription upon a tomb. It has been disputed whether the ancient Jews inscribed epitaphs on the monuments of the dead; but it is certain, some of very ancient date are found amongst them. The Athenians put only the name of the dead, with the epithet *χρηστος*, good, or *ηστος*, hero, and the word *χαίρει*, signifying their good wishes. The name of the deceased's father and his tribe were frequently added. The Lacedemonians allowed epitaphs to none but those who had died in battle. The Romans inscribed their epitaphs to the manes, dies manibus; and frequently introduced the dead, by way of prosopopœia, speaking to the living; of which we have a fine instance, worthy the Augustan age, wherein the dead wife thus bespeaks her surviving husband:

Immutata perii; sed tu, felicior, annos

Vive tuos, conjux optime, vive meos.

The epitaphs of the present age are too often filled with fulsome compliments which were never merited, characters which human nature in its best state could scarce lay claim to, and expressions of respect which were never paid in the life-time of the deceased. Hence the proverb, "He lies like an epitaph."

EPITAPH is also applied to certain elegies, either in prose or verse, composed without any intent to be engraven on tombs; as, That of Alexander,

Sufficit huic tumulus, cui non sufficeret orbis;

and that of Newton,

Isaacum Newton

Quem immortalem

Testantur Tempus, Natura, Cœlum,

Mortalem hoc marmor

Fatetur.

EPITASIS, in ancient poetry, the second part of a dramatic poem, wherein the plot, entered upon in the protasis, or first part, was carried on, heightened, and worked up, till it arrived at its state or height, called catastasis.

EPITASIS, in medicine, the increase of a disease or beginning of a paroxysm, particularly in a fever.

EPITHALAMIUM, [*ἐπι θάλαμῳ*], a nuptial song; a compliment upon marriage.

The **EPITHALAMIUM** among the Jews, was sung at the door of the bride, by her friends and companions, the evening before the marriage. The xlvth Psalm is an epithalamium. Among the Greeks it was sung as soon as the married couple were going to bed, and attended with shouts and stamping of the feet. They returned in the morning, and with the same song, a little altered, saluted them again. The evening songs were called *ἐπιθάλαμια χομίζοντα*; the morning salutes *ἐπιθάλαμια ἐγχετνα*. This was the practice amongst the Romans also, but their epithalamia were often obscene.

EPITHAURO. See EPIDAUROS.

EPITHEM, [*ἐπιθήμα*], in pharmacy, a remedy of a spirituous or aromatic kind, applied externally to the regions of the heart, liver, &c. to strengthen and comfort, or correct some intemperature of the part.

EPITHET, [*ἐπιθετον*], in poetry and rhetoric, an adjective expressing some quality of a substantive to which it is joined; or such an adjective as is annexed to substantives by way of ornament and illustration, not to make up an essential part of the description. Nothing, says Aristotle, tires the reader more than too great a redundancy of epithets, or epithets placed improperly; and yet nothing is so essential in poetry as a proper use of them. The writings of the best poets are full of them.

EPITOME, [*ἐπιτομή*], abridgment; abbreviature; compendious abstract; compendium. See ABRIDGMENT.

EPITRITUS,

EPITRITUS, in prosody, a foot consisting of three long and one short syllable. Of these, grammarians reckon four kinds: the first consisting of an iambus and spondaus, as *sālūtāntēs*; the second of a trochæus and spondaus, as *cōncitātī*; the third of a spondaus and an iambus, as *cōmmūnicāns*; and the fourth of a spondaus and trochæus, as *īncāntārē*.

EPITROPUS, a kind of arbitrator, whom the Greek Christians under the Turks elect to terminate their differences, and avoid carrying them before the Turkish magistrates. Anciently the Greeks used the term *ἐπίτροπος* in the same sense as the Latins did *procurator*, viz. for a commissioner or intendant.

EPIZEUXIS, in rhetoric, a figure which repeats the same word, without any other intervening; such is that of Virgil, "Nunc, nunc, insurgite remis."

EPOCHA, [*ἐποχή*, from *ἐπέχω*, to contain,] in chronology, a term or fixed point of time, whence the succeeding years are numbered or accounted. The most remarkable epochas are those that follow.

EPOCHA OF THE CREATION OF THE WORLD. According to the Vulgate, archbishop Ussher places this event 4004 years before the vulgar æra of the birth of Christ; Scaliger makes it 3950, Petavius 3984, and Ricciolus 4184 years before Christ. According to the Septuagint, Eusebius places the creation 5200 years before the nativity of our Lord; the Alphonsine tables, 6934; and Ricciolus 5634. The creation, therefore, as we follow the archbishop, happened in the year 710 of the Julian period. Sir Isaac Newton, again, makes the creation of the world later by 500 years than all other chronologists; and the proofs by which this illustrious philosopher supports his opinion are of two different kinds. The Egyptians counted 341 generations from Menes to Setho, allowing a hundred years for three generations; and the ancient Greeks computed one generation at about forty years. Now, says Sir Isaac, it is true, three ordinary generations may be computed at about 120 years; but generations are longer than the reign of kings, because it is evident that mankind in general live longer than kings reign. The duration of a reign, therefore, taking one with another, is according to him about twenty years: whence he concludes, that the ancients have erred in their calculation in allowing forty years for every generation. The second kind of proof is taken from the precession of the equinoxes. According to Clemens Alexandrinus, Chiron, who was in the expedition of the Argonauts, fixed the vernal equinox at the fifteenth degree of Aries, and consequently the summer-solstice at the fifteenth degree of Cancer. Meto fixed the summer-solstice at the eighth degree of Cancer, a year before the Peloponnesian war. Now since one degree answers to the retrograde motion of the equinoctial points in 72 years, there are seven times 72 years from the expedition of the Argonauts to the beginning of the Peloponnesian war: that is, 504 years, and not 507 years, as the Greeks affirm. By combining these two different proofs, Sir Isaac concludes, that the expedition of the Argonauts ought to be placed 909 years before Jesus Christ, and not 1400, as is generally believed: and therefore that the creation of the world ought to be placed about 500 years later than chronologists generally place it.

EPOCHA OF THE DELUGE. According to the Hebrew text, there are 1656 years from the creation to the deluge; 1307 according to the Samaritan; 2242, according to Eusebius and the Septuagint; 2256, according to Josephus and the Septuagint; and 2262, according to Julius Africanus, Petavius, and the Septuagint. In following the Hebrew text this epocha begins in the year 2366 of the Julian period.

EPOCHA OF THE OLYMPIADS, used principally by the Greeks, had its origin from the olympic games, which were celebrated at the beginning of every fourth year. This epocha begins 776 years before the incarnation, or in the year 3938 of the Julian period.

EPOCHA, VARRONIAN, OF THE BUILDING OF ROME, is fixed 753 years before our Saviour's birth, and in the year 3961 of the Julian period.

EPOCHA OF NABONASSAR, KING OF BABYLON, made use of by Ptolemy, Censorinus, and several other authors, began 747 years before the incarnation, and in the year 3967 of the Julian period.

EPOCHA, JULIAN. The first year of Julius Cæsar's correcting the calendar stands 45 years before our Saviour's birth, and coincides with the year 466 of the Julian period.

EPOCHA OF CHRIST. The Christian world generally reckon-

ed from the epocha of the creation, the building of Rome, the consuls' register, or the emperor's reign, till about 500 years after Christ, when the epocha of the nativity of our blessed Lord was introduced by Dionysius Exiguus. He began his account from the conception or incarnation, properly called Lady-day. Most countries in Europe, however, at present reckon from the first of January next following, except the court of Rome, where the epocha of the incarnation still obtains for the date of their bulls and briefs. But here we are to observe, that there are different opinions respecting the year of our Saviour's birth. Capellus and Kepler fix it at about the 758th year from the building of Rome. Decker and Petavius place the incarnation in the 749th of Rome. Scaliger and Vossius make it fall on the 751st of Rome. Dionysius Exiguus, Bede, &c. fix the birth of our Saviour to the year 751 of Rome; the diversity of these opinions proceeding from the difficulty of fixing Herod the Great's death, who, as is evident from the evangelists, was living at our Saviour's birth, the taxation of Cyrenius, and the time of our Saviour's beginning his ministry. But it is generally agreed, that as to computation and use, the common epocha is to be followed which places the birth of Christ in the 4713th of the Julian period, although the true birth rather corresponds with the 4711th of the same period.

EPOCHA, DIOCLESIAN, OR EPOCHA OF MARTYRS, called also the æra of the Cophti or Egyptians, because the emperor Dioclesian made a great many martyrs in Egypt, begins in the year 283 of our Lord, and the 4997th of the Julian period.

EPOCHA OF THE HEGIRA, OR FLIGHT OF MOHAMMED, is an æra used by the Mohammedans. In obedience to the command of their prophet they make use of the lunar year, which consists of 12 complete synodic revolutions of the moon; so that their year contains 354 and sometimes 355 days. The first year of this epoch happened in the 5335th year of the Julian period, and in the 622d year of the Christian æra. The following is a Table of the Epocha of the Hegira connected with the Christian æra from A. D. 1810 to A. D. 1923. *N.B.* An asterisk prefixed before any particular year of Christ denotes it to be bissextile, and a dagger before any particular year of the Hegira points it out to be one of those years which contains 355 days. The month and day of the month placed after the year of the Hegira is the day of the corresponding year of Christ upon which the said year of the Hegira commences.

EPOCHA, PERSIAN, or YEZDEJERD, is the year of the Julian period 5345, answering to the year 632. To reduce the years of one epocha to those of another, observe the following rule; add the given year of an epocha to the year of the Julian period corresponding with its rise, and that will give the year of the period. For example, if to 1810, the present year of the Christian epocha, we add 4713, the year of the Julian period corresponding with its rise, the sum, 6523, will be the present year of the Julian period; now if we subtract from the year thus found, the year of the Julian period corresponding with the rise of any epocha, the remainder shews the true method of making a just connection betwixt that epocha and the known year of Christ. Again, if we want to find the year of the Julian period corresponding to a given year before Christ, we subtract the given year from 4714, and the remainder is the year required. See CHRONOLOGY and ERA.

EPODE, [*επὸδος*], in lyric poetry, the third or last part of the ode: the ancient ode being divided into strophe, antistrophe, and epode. The epode was sung by the priests, standing still before the altar, after all the turns and returns of the strophe and antistrophe, and was not confined to any precise number or kind of verses. The epode is now a general name for all kinds of little verses that follow one or more great ones, of what kind soever they be; and, in this sense, a pentameter is an epode after an hexameter. And as every little verse, which being put after another, closes the period, is called epode, hence the sixth book of Horace's odes is entitled "Liber Epodon, Book of Epodes;" because the verses are all alternately long and short, and the short ones generally, though not always, close the sense of the long one.

EPONA, in mythology, a goddess mentioned in some ancient inscriptions. Keyser supposes, that her name was derived from *επώνη*, a horse, and that she was worshipped as the protectress of these animals.

EPOPEE, or EPOPOEIA, in poetry, the history, action, or

fable, which makes the subject of an epic poem. The word is derived from the Greek *επος*, verse, and *ποιεω*, to make.

EPSOM, a town of Surrey, about 16 miles S. W. of London, long famous for its mineral waters. These were discovered in 1618; and are not yet impaired in virtue. The salt made from them is famous all over Europe, for gently cleansing and cooling the body. The hall, galleries, and other public apartments, are now run to decay; and there remains only one house on the spot, which is inhabited by a countryman and his wife, who carry the waters in bottles to the adjacent places, and supply the demands of dealers in London. On the neighbouring down are annually horse-races; but the inns, shops, and bowling-greens, are not so much frequented as formerly. The market is on Friday; the fair, July 25. Epsom has so many fields, meadows, orchards, gardens, &c. that a stranger would be at a loss to know whether it were a town built in a wood, or a wood surrounded by a town.

EPSOM SALT, was formerly obtained by boiling down the mineral water found in the vicinity of Epsom. It is at present prepared from sea-water, which after being boiled down, deposits an uncrystallized brine, that consists chiefly of muriated magnesia, and is sold in the shops, under the name of bitter purging salt.—It is of considerable service in colics, scurvy, rheumatism, and other chronical complaints.

EPSOM WATER is easily imitated by art; i. e. by only dissolving half an ounce of Epsom salt in a quart of pure water, made somewhat brisk by a few drops of spirit of vitriol and oil of tartar, so as to let the alkali prevail.

EPULARES, in antiquity, persons who were admitted to the sacred epulae or entertainments, it being unlawful for any to be present at them who were not pure and chaste.

EPULO, in antiquity, a minister of sacrifice among the Romans. The pontifices, not being able to attend all the sacrifices performed at Rome to so many gods as were adored by that people, appointed three ministers, whom they called epulones, because they conferred on them the care and management of the epula, feasts in the solemn games and festivals.

EPULUM, in antiquity, a holy feast prepared for the gods in times of public danger. The feast was sumptuous, and the gods were formally invited and attended; for the statues were brought on rich beds furnished with soft pillows, called pulvinaria: thus accommodated, their godships were placed on their couches at the most honourable part.

EPULUM also means any solemn feast, e. g.

EPULUM FEMALE, a funeral entertainment.

EPWORTH, a town of England, in the isle of Axholm, Lincolnshire, 11 miles N. of Gainsborough.

EQUABLE, an appellation given to such motions as always continue the same in degree of velocity, without being either accelerated or retarded. When two or more bodies are uniformly accelerated or retarded, with the same increase or diminution of velocity in each, they are said to be equably accelerated or retarded.

EQUAL, a term of relation between two or more things of the same magnitude, quantity, or quality.

EQUALITY, that agreement between two or more things, whereby they are denominated equal. The equality of two quantities, in algebra, is denoted by two parallel lines placed between them: thus, $4 + 2 = 6$, that is, 4 added to 2, is equal to 6.

EQUALITY, in a political sense, is a term much used, though not generally understood. All men are or ought to be upon an equality with regard to their rights. Their right to have their persons and their property (whether it be great or small) protected by the government under which they live, cannot be disputed. Neither can the right to do any thing that is not injurious to another, which is the only true definition of liberty, be called in question, let the party exercising it be ever so poor. But it is a dangerous error to suppose, that an equality of property is meant by the term; for that is to suppose, what is not true, that all men are equal in merit and in abilities. In fact, if the Almighty were by one act of his power, to make an equal and universal division of all the property and productions of this world among the whole human race, one week would not elapse before very considerable inequalities of property would arise from the indolence and extravagance of some, the avarice of others, and the virtuous industry and economy of others.

EQUANIMITY,

EQUANIMITY, in ethics, denotes that even and calm frame of mind and temper, under good or bad fortune; whereby a man appears to be neither puffed up, or overjoyed with prosperity; nor dispirited, soured, or rendered uneasy, by adversity. See **MORAL PHILOSOPHY** and **PASSIONS**.

EQUANT, in the old astronomy, a circle described on the centre of the deferent, for accounting for the eccentricity of the planets. See **EXCENTRIC** and **EXCENTRICITY**.

EQUATION, in algebra, the mutual comparing of two equal things of different denominations, or the expression denoting this equality; which is done by setting the one in opposition to the other, with the sign of equality (=) between them: thus $3s = 36d$, or 3 feet = 1 yard. Hence, if we put a for a foot, and b for a yard, we shall have the equation $3a = b$, in algebraical characters. See **ALGEBRA**.

EQUATION, ANNUAL, of the mean motion of the sun, and moon's apogee and nodes. The annual equation of the sun's mean motion depends upon the eccentricity of the earth's orbit round him, and is $16\frac{1}{2}$ such parts, of which the mean distance between the sun and the earth is 1000; whence some have called it the equation of the centre, which, when greatest, is $1^\circ 55' 35''$. The greatest equation of the moon's mean motion is $11' 40''$; of its apogee, $20'$; and of its node, $9' 30''$. These four annual equations are always mutually proportionable to each other; so that when any of them is at the greatest, the three others will also be greatest; and when one diminishes, the rest diminish in the same ratio. Wherefore the annual equation of the centre of the sun being given, the other three corresponding equations will be given; so that one table of the central equations may serve for all.

EQUATION OF CURVES, an equation expressing the nature of a curve, the relation between an absciss and a corresponding ordinate, or the relation of their fluxions. See **CURVE**. When the natures or properties of curves are expressed by algebraic equations any general absciss is commonly denoted by the letter x , and the corresponding ordinate by the letter y ; the other, or constant lines, being represented by other letters. Then the equations expressing the natures of different curves will admit of various forms, according to the situation of the point at which the absciss is supposed to commence, or to the relations of the co-ordinates. Thus, if the abscisses should be estimated from the vertex of the curve or from the end of the diameter then the equations are as follow: namely for the

Circle, $2dx - x^2 = y^2$, where $2d$ is the diameter AB, (fig. 33, Plate LVII.); x is the absciss AP or BP, and y is the ordinate PQ.

Parabola, $px = y^2$, where p is the parameter.

Ellipse, $\frac{t^2 y^2}{c^2} = 2tx - x^2$
Hyperbola, $\frac{t^2 y^2}{c^2} = \pm 2tx + x^2$

Where $2t$ is the transverse, and $2c$ the conjugate axis.

But if we take the abscisses from the centres, then in the

Circle, $d^2 - x^2 = y^2$, where $2d$ is the diameter.

Ellipse, $\frac{t^2 y^2}{c^2} = t^2 - x^2$
Hyperbola, $\frac{t^2 y^2}{c^2} = x^2 - t^2$

Where $2t$ and $2c$ are as before.

We may likewise make use of p the parameter in the equations to the ellipse and hyperbola: then in the

Ellipse, $\frac{2ty^2}{p} = 2t - xx$
Hyperbola, $\frac{2ty^2}{p} = x^2 \pm 2tx$

When the abscisses are taken from the vertex.

Ellipse, $\frac{2ty^2}{p} = t^2 - x^2$
Hyperbola, $\frac{2ty^2}{p} = x^2 - t^2$

When the abscisses are taken from the centre.

EQUATION, CONSTRUCTION OF, in algebra, the method of drawing a geometrical figure whose properties shall express the given equation, in order to demonstrate the truth of it geometrically.

EQUATION, A SIMPLE, is constructed by resolving the given simple equation into a proportion, or finding a third or fourth proportional, &c. Thus, 1. If the equation be $ax = bc$; then

$a : b :: c : x = \frac{bc}{a}$, the fourth proportional to a, b, c .

2. If $ax = b^2$; then $a : b :: b : x = \frac{b^2}{a}$, a third proportional to a and b .

3. If $ax = b^2 - c^2$; then, since $b^2 - c^2 = \overline{b+c} \times \overline{b-c}$, it will be $a : b + c :: b - c : x = \frac{(b+c) \times (b-c)}{a}$, a fourth proportional to $a, b + c$, and $b - c$.

If the equation be $x = \frac{ab+mn}{r-s}$, first find a mean proportional between a and b , which suppose to be p , also another mean proportional between m and n , which suppose to be q , then the equation will stand thus $x = \frac{p^2+q^2}{r-s}$. Which may be constructed

in the following manner. Let the base AB, (Plate LVII. fig. 26,) of the right-angled triangle APB be made equal to q , and the perpendicular AP equal to p ; then will PB^2 be equal $p^2 + q^2$, which according to the equation is to be divided by $r - s$. Therefore it will be as $r - s : PB (= \sqrt{p^2 + q^2}) :: PB$ to a third proportional, which will give x required.

EQUATIONS, QUADRATIC, require for their construction lines of the second order; hence it is necessary to shew the nature of these lines. See **CURVE**. The general equation expressing the nature of the lines of the second order, having all its terms and coefficients, will be in this form:

$$\left. \begin{array}{l} y^2 + axy + cx^2 \\ + by + dx \\ + e \end{array} \right\} = 0.$$

Where a, b, c, d, e represent any given quantities with their proper signs prefixed to them. If a quadratic equation is given, as $y^2 + py + q = 0$, and by comparing it with the preceding, if you take the quantities a, b, c, d, e , and x such, that $ax + b = p$, and $cx^2 + dx + e = q$, then will the values of y in the first equation be equal to the values of it in the second; and if the locus be described according to the first equation, the two values of the ordinate, when $ax + b = p$, and $cx^2 + dx + e = q$, will be the two roots of the equation $y^2 + py + q = 0$. See **LOCUS**. And as four of the given quantities a, b, c, d, e , may be taken at pleasure, and the fifth with the absciss x determined so, that $ax + b$ may be still equal to p , and $cx^2 + dx + e = q$; hence there are innumerable ways of constructing the same equation. But these loci are to be preferred which are described most easily; and therefore the circle of all conic sections is to be preferred for the resolution of quadratic equations. Let AB, fig. 27, be perpendicular to AE, and upon AB describe the semicircle BMMA. If AP be supposed equal to x , AB = a , and PM = y ; then making MRMR perpendicular to the diameter AB, since $AR \times RB = RM^2$, and $AR = y$, $RB = a - y$, $RM = x$, it follows that $a - y \times y = x^2$, and $y^2 - ay + x^2 = 0$. And if an equation $y^2 - py + q = 0$ be proposed to be resolved, its roots will be the ordinates to the circle, PM and PM, to its tangent AE, if $a = p$, and $x^2 = q$: because then the equation of the circle $y^2 - ay + x^2 = 0$ will be changed into the proposed equation $y^2 - py + q = 0$. We have therefore this construction for finding the roots of the quadratic equation $y^2 - py + q = 0$, take AB = p , and on AB describe a semicircle: then raise AE perpendicular to AB, and on it take AP = $\sqrt{q}$, that is, a mean proportional between 1 and q (by 13 el. 6.) then draw PM parallel to AB, meeting the semicircle in MM and the lines PM, PM, shall be the roots of the proposed

equations. It appears from the construction that if $q = \frac{p^2}{4}$, or

$\sqrt{q} = \frac{1}{2}p$, then $AP = \frac{1}{2}AB$, and the ordinate PN touches the curve in N, the two roots PM, PM, in that case becoming equal to one another, and to PN. If AP be taken greater than $\frac{1}{2}AB$, that is, when $\sqrt{q}$ is greater than $\frac{1}{2}p$, or q greater than $\frac{1}{4}p^2$, the ordinates do not meet the circle, and the roots of the equation become imaginary. The roots of the same equation may be otherwise thus determined. 1. If it be a simple quadratic, it may be reduced to this form $x^2 = ab$; and hence $a : x :: x : b$, or $x = \sqrt{ab}$, a mean proportional between a and b . Therefore upon a straight line (fig. 28,) take $AB = a$, and $BC = b$; then upon the diameter AC describe a semicircle, and raise the perpendicular BD to meet it in D; so shall BD be $= x$, the mean proportional sought between AB and BC, or between a and b .

2. If the quadratic be affected, let it first be $x^2 + 2ax = b^2$; then form the right-angled triangle whose base AB (fig. 29,) is a , and perpendicular BC is b ; and with the centre A and radius AC, describe the semicircle DCE; so shall DB and BE be the two roots of the given quadratic equation $x^2 + 2ax = b^2$.

3. If the quadratic be $x^2 - 2ax = b^2$, then the construction will be the very same as of the preceding one $x^2 + 2ax = b^2$.

4. But if the form be $2ax - x^2 = b^2$; form a right-angled triangle whose hypotenuse FG is a , (fig. 30,) and perpendicular GH is b ; then with the radius FG and centre F describe a semicircle IGK; so shall IH and HK be the two roots of the given equation $2ax - x^2 = b^2$, or $x^2 - 2ax = -b^2$.

EQUATIONS, CUBIC AND BIQUADRATIC, may be constructed by means of the conic sections. The roots of any equation may be determined by the intersections of a straight line with a curve of the same dimensions as the equation, or by the intersections of any two curves whose indices multiplied by each other, give a product equal to the index of the proposed equation. Thus the roots of a biquadratic equation may be determined by the intersections of two conic sections; for the equation by which the ordinates from the four points in which these conic sections may cut one another can be determined, will arise to four dimensions: and the conic sections may be assumed in such a manner, as to make this equation coincide with any proposed biquadratic: so that the ordinates from these four intersections, will be equal to the roots of the proposed biquadratic. If one of the intersections of the conic section falls upon the axis, then one of the ordinates vanishes, and the equation by which these ordinates are determined will then be of three dimensions only, or a cubic, to which any proposed cubic equation may be accommodated. So that the three remaining ordinates will be the three roots of that proposed cubic. Those conic sections ought to be preferred for this purpose that are most easily described. They must not, however, be both circles; for their intersections are only two, and can serve only for the resolution of quadratic equations. Yet the circle ought to be one, as being most easily described, and the parabola is commonly assumed for the other. Their intersections are determined in the following manner. Let APE be the common Apollonian parabola, (fig. 31.) Take on its axis the line AB = half of its parameter. Let C be any point in the plane of the parabola, and from it, as a centre, describe with any radius CP a circle meeting the parabola in P. Let PM, CD, be perpendiculars on the axis in M and D, and let CN parallel to the axis meet PM in N. Then will always $CP^2 = CN^2 + NP^2$ (47. 1. Euc.) Put $CP = a$, the parameter of the parabola $= b$, $AD = c$,

$DC = d$, $AM = x$, $PM = y$. Then $CN^2 = x^2 + c^2$, $NP^2 = y^2 + d^2$; and $x^2 + c^2 + y^2 + d^2 = a^2$. That is $x^2 \pm 2cx + c^2 + y^2 \pm 2dy + d^2 = a^2$. But from the nature of the parabola, $y^2 = bx$, and $x^2 = \frac{y^4}{b^2}$; substituting therefore these values for x^2

and x , it will be $\frac{y^4}{b^2} \pm \frac{2cy^2}{b} + y^2 \pm 2dy + c^2 + d^2 - a^2 = 0$.

Or multiplying by b^2 , $y^4 \pm 2bcy^2 + y^2 \pm 2db^2y + c^2 + d^2 - a^2 \times b^2 = 0$. Which may represent any biquadratic equation that wants the second term; since such values may be found for a , b , c , and d , by comparing this with any proposed biquadratic as to

make them coincide. And then the ordinates from the points P, P, P, on the axis, will be equal to the roots of that proposed biquadratic; and this may be done though the parameter of the parabola, viz. b , be given: that is, if you have a parabola already made or given, by it alone you may resolve all biquadratic equations, and you will only need to vary the centre of your circle and its radius. If the circle described from the centre (fig. 32,) pass through the vertex A, then $CP^2 = CA^2 = CD^2 + AD^2$, that is $a^2 = d^2 + c^2$; and the last term of the biquadratic ($c^2 + d^2 - a^2$) will vanish; therefore dividing the rest by y , there arises the cubic $y^3 \pm 2bc + b^2 \times y \pm 2db^2 = 0$. Let the cubic equation proposed to be resolved be $y^3 \pm py \pm r = 0$. Compare the terms of these two equations and you will have $\pm 2bc + b^2 = \pm p$, and

$$\pm 2db^2 = \pm r, \text{ or } \mp c = \frac{b}{2} \mp \frac{p}{2b}, \text{ and } d = \pm \frac{r}{2b^2}.$$

From which you have this construction of the cubic $y^3 \pm py \pm r = 0$, by means of any given parabola APE. From the point B, take in the axis (forward if the equation has $-p$, but backward if p be

positive) the line $BD = \frac{p}{2b}$; then raise the perpendicular $DC =$

$\frac{r}{2b^2}$, and from C describe a circle passing through the vertex A,

meeting the parabola in P; so shall the ordinate PM be one of the roots of the cubic $y^3 \pm py \pm r = 0$. The ordinates that stand on the same side of the axis with the centre C, are negative or affirmative, according as the last term r is negative or affirmative; and those ordinates have always contrary signs that stand on different sides of the axis. See Maclaurin's Algebra, part iii. cap. 2; and Simpson's Algebra, p. 267.

EQUATION OF TIME, in astronomy and chronology, the reduction of the apparent time or motion of the sun, to equable, mean, or true time. The difference between true and apparent time arises from two causes, the eccentricity of the earth's orbit, and the obliquity of the ecliptic. See ASTRONOMY.

EQUATOR. See ASTRONOMY and GEOGRAPHY.

EQUATORIAL SECTOR. See ASTRONOMY.

EQUERRY, or ECURY, popularly called Query, an officer of the king's stables, under the master of the horse. Of these there are seven, who, when his majesty goes abroad, ride in the leading coach, are in waiting one at a time monthly, and have a table with the gentlemen ushers during the time, and a salary of 300l. a-year each.

EQUERRY OF THE CROWN STABLE has that appellation, as being employed in managing and breaking the saddle horses, and preparing them for the king's riding.

EQUERY, or ECURY, [*Ecurie*, French, or *equile*, Lat. a stable, from *equus*, a horse,] a grand stable for horses, furnished with stalls, manger, rack, &c. Some think the word stable properly relates only to bullocks, cows, sheep, hogs, &c. and equery, to horses, mules, &c. A simple equery is that provided for one row of horses; a double equery that provided for two, with a passage in the middle, or two passages; the horses being placed head to head, as in the little equery at Versailles. Under equery are sometimes also comprehended the lodgings and apartments of the equerries, grooms, pages, &c.

EQUERY, [*esouyer*,] is also an officer who has the care of the horses of a king or prince.

EQUES, [from *equus*, a horse,] in antiquity, a knight, or horseman. See EQUITES.

EQUES, AURATUS, a knight bachelor; called *auratus*, i. e. gilt, because anciently none but knights might gild or beautify their armour with gold. In law this term is not used, but instead of it miles, and sometimes chevalier.

EQUESTRIA, in Roman antiquity, a place in the theatre where the equites or knights sat.

EQUESTRIAN GAMES, among the ancient Romans, horse-races, of which there were five kinds, the prodromus or plain horse-race, the chariot-race, the decursory race about funeral piles, the *ludi sevirales*, and the *ludi neptunales*.

EQUESTRIAN ORDER, among the Romans, signified their equites or knights; also their horsemen in the field; the first of which orders

orders stood in contradiction to the senators; as the last did to the foot, military, or infantry.

EQUIANGULAR, in geometry, an epithet applied to figures whose angles are all equal: such are a square, an equilateral triangle, &c.

EQUICRURAL, in geometry, the same with isosceles, a term applied to a triangle having two equal sides.

EQUIDIFFERENT NUMBERS, in arithmetic, numbers in arithmetical progression; they are of two kinds, 1. Continually equidifferent is when, in a series of three numbers, there is the same difference between the first and second, as there is between the second and third; as 3, 6, 9. And 2. Discretely equidifferent, is when, in a series of four numbers or quantities, there is the same difference between the first and second as there is between the third and fourth: such are 3, 6, 7, 10.

EQUIDISTANT, an appellation given to things placed at equal distance from some fixed point, or place, which they are referred.

EQUILATERAL, in general, something that hath equal sides, as an equilateral triangle.

EQUILATERAL HYPERBOLA, one whose transverse diameter is equal to its parameter; and so all the other diameters equal to their parameters; in such an hyperbola, the asymptotes always cut one another at right angles in the centre. Its most simple equation, with regard to the transverse axis, is $y^2 = x^2 - a^2$; and with regard to the conjugate, $y^2 = x^2 + a^2$, when a is the semitransverse, or semi-conjugate. The length of the curve cannot be found by means of the quadrature of any space, of which a conic section is any part of the perimeter.

EQUILIBRIUM, in mechanics, is when the two ends of a lever or balance hang so exactly even and level, that neither ascends, nor descends, but both keep in a position parallel to the horizon; being both charged with an equal weight. See **MECHANICS**.

EQUIMULTIPLES, in arithmetic and geometry, are numbers or quantities multiplied by one and the same number or quantity. Hence, equimultiples are always in the same ratio to each other as the simple quantities before multiplication; thus, if six and eight are multiplied by four, the equimultiples 24 and 32 will be to each other as six to eight.

EQUINOCTIAL, or **EQUINOCTIAL**, [*æquus* and *nox*, Lat.] in astronomy, a great and immoveable circle of the sphere, under which the equator moves in its diurnal motion. It is ordinarily confounded with the equator: but there is a difference; the equator being moveable, and the equinoctial immoveable; and the equator being drawn about the convex surface of the earth, but the equinoctial on the concave surface of the heavens. The shadows of those who live under this circle are cast to the southward of them for one half of the year, and to the northward during the other half; and twice in a year, viz. at the equinoxes, the sun at noon casts no shadow, being in their zenith. See **ASTRONOMY**.

EQUINOCTIAL DIAL, that whose plane lies parallel to the equinoctial. See **DIALING**.

EQUINOCTIAL POINTS are the two points wherein the equator and ecliptic intersect each other: the one, being in the first point of Aries, is called the vernal point or equinox; and the other, in the first point of Libra, the autumnal point or equinox. The equinoctial points, and all the other points of the ecliptic, are continually moving backward, or in antecedentia, i. e. westward. This retrograde motion is that famous and difficult phenomenon called the precession of the equinoxes. See **ASTRONOMY**.

EQUINOX, the time when the sun enters either of the equinoctial points, where the ecliptic intersects the equinoctial. See **ASTRONOMY**, and **EQUINOCTIAL**.

EQUIPAGE, in military art, denotes all sorts of utensils, artillery, &c. necessary for commencing and prosecuting with ease and success any military operations. Camp and field equipage consists of tents, kitchen furniture, saddle horses, baggage, waggons, bat horses, &c.

EQUIPOLLENCE, in logic, is when there is an equivalence, or agreement, either as to the nature of the thing, or as to the grammatical sense of any two, or more propositions: that is, when two propositions signify one and the same thing, though they express it after different manners.

EQUIRIA, in antiquity, a festival instituted by Romulus, and

celebrated on the 27th of February, in honour of Mars, at which there were horse-races.

EQUISETUM, **HORSE TAIL**: A genus of the order filices, and cryptogamia class of plants; natural order, Conifera. There is a spike of pettated or shielded fructifications opening at the base. There are seven species: natives of Europe in woods and shady places.

EQUITES, amongst the Romans, were persons of the second degree of nobility, next to the senators in point of rank. The equites or knights were required to be possessed of 400 sesteria before they could be admitted into that order; and when they were so reduced as to fall short of the prescribed revenue, they were expunged out of the equestrian list. This revenue amounted to about 10,000 crowns. Part of the ceremony whereby the honour of knighthood was conferred amongst the Romans was the giving of a horse; every eques received also the stipend of a horseman to serve in the wars, and wore a ring which was given him by the state.

EQUITY, in a general sense, the virtue of treating all other men according to reason and justice, or as we would be treated ourselves when we understand aright what is our due. See **JUSTICE**.

EQUITY, in jurisprudence, is defined a correction or qualification of the law, generally made in that part wherein it faileth or is too severe. It likewise signifies the extension of the words of the law to cases unexpressed, yet having the same reason; so that where one thing is enacted by statute, all other things are enacted that are of the like degree, e. g. the statute of Gloucester gives action of waste against him that holds lands for life or years; and by the equity thereof, a man shall have action of waste against a tenant that holds but for one year, or one half-year, which is without the words of the act, but within the meaning of it; and the words that enact the one, by equity enact the other. So that equity is of two kinds. The one abridges and takes from the letter of the law: the other enlarges and adds to it; and statutes may be construed according to equity, especially where they give remedy for wrong, or are for expedition of justice. Equity seems to be the interposing law of reason, exercised by the lord chancellor in extraordinary matters to do equal justice; and by supplying the defects of the law, gives remedy in all cases.

EQUITY, in mythology, sometimes confounded with Justice, a goddess among the Greeks and Romans, represented with a sword in one hand and a balance in the other.

EQUIVALENT PROPOSITIONS, those that signify the same thing differently expressed.

EQUIVALENT TERMS are where several words that differ in sound have yet one and the same signification; as every body was there, and nobody was absent; *nilhil non*, and *omne*.

EQUIVALENT THINGS, are either moral, physical, or statical. 1. Moral; e. g. the commanding or advising a murder is a guilt equivalent to that of the murderer. 2. Physical; a man who has the strength of two men is said to be equivalent to two men. 3. Statical; a less weight becomes equivalent in force with a greater, by having its distance from the centre increased.

EQUIVOCAL TERMS, or **WORDS**. Words of doubtful signification. Mr. Locke observes, that the doubtfulness and uncertainty of words has its cause more in the ideas themselves, than in any incapacity of the words to signify them; and might be avoided, would people always use the same term to denote the same idea or collection of ideas: but, adds he, it is hard to find a discourse on any subject where this is the case; a practice which can only be imputed to folly or great dishonesty; since a man, in making up his accounts, might with as much fairness use the numeral characters sometimes for one sometimes for another collection of units.

EQUIVOCATIONS are expedients to save telling the truth, and yet without telling a falsity. The fathers were too much addicted to equivocations.

EQUULEUS, or **ECCULEUS**, in antiquity, a kind of rack used for extorting a confession, at first chiefly practised on slaves, but afterwards made use of against the Christians.

EQUULEUS, **EQUICULUS**, or **EQUUS MINOR**, in astronomy, the horse's head; a constellation of the northern hemisphere. See **ASTRONOMY**.

EQUUS, in zoology, a genus of the class mammalia and order bellua.

belluæ. They have six erect and parallel fore-teeth in the upper jaw, and six somewhat prominent ones in the under jaw; one short tusk on each side of both jaws, at a considerable distance from the other teeth; and the feet consist of an undivided hoof. This genus is the only race of quadrupeds, in which the mammae are wanting on the males. Mr. Kerr enumerates six species, and many varieties.

I. *CABALLUS*, the COMMON HORSE, has a long flowing mane, and the tail covered on all parts with long hairs. The horse, in a domestic state, is a bold and fiery animal; equally intrepid as his master, he faces danger and death with ardour and magnanimity. He delights in the noise and tumult of arms, and seems to feel the glory of victory; he exults in the chase; his eyes sparkle with emulation in the course. But though bold and intrepid, he is docile and tractable; he knows how to govern and check the natural vivacity and fire of his temper. He not only yields to the hand, but seems to consult the inclination, of his rider. Constantly obedient to the impressions he receives, his motions are entirely regulated by the will of his master. He in some measure resigns his very existence to the pleasure of man. These excellencies, though in some degree natural to him are principally the effects of education of which the horse is remarkably susceptible. In most parts of the world the horse is found in a domesticated state, and it is said that in several parts of Asia and Africa they maintain their original independence, and range at pleasure in herds of several hundreds, having always one or more as an advanced guard, to alarm against approaching danger. These alarms are expressed by a sudden snorting, at which the main body gallop off with the most surprising swiftness. Wild horses are found, according to Dr. Pallas, in the deserts on each side the river Don, towards the Palus Mæotis; but these are supposed to be the offspring of the Russian horses, which were employed in the siege of Asoph, in the year 1697, when for want of forage they were turned loose, and their descendants have gradually relapsed into the appearance of natural wildness. Those which are found in some parts of South America, are well known to be the descendants of the horses introduced by the Spaniards on the first discovery of America, and which have so far relapsed into a state of nature as to exhibit the general characters of the wild animals. Of the several breeds of horses in common or general use in Europe, it is remarkable that none can come in competition with those of our own island, either for the strength required in laborious services, or for the swiftness and elegance of such as are bred for the course. The annals of Newmarket record instances of horses that have literally out-stripped the wind, as is proved from accurate calculations. The celebrated Childers is commemorated, in particular, as the swiftest horse ever known in the world; and the instances of his speed may be found in various publications. He was known to have run near a mile in a minute; and to have cleared the course at Newmarket, which is only 400 yards short of four miles, in six minutes and forty seconds; running at the rate of eighty-two feet and a half in the space of a second. This country has produced some others almost equally swift with Childers. See Plate LXVI. Draught-horses in Great Britain exceed in size and power those of other countries. Yorkshire and Lincolnshire are the most celebrated counties for this breed, whence several have been brought to London which have each, for a short distance drawn, without difficulty, the weight of three tons, half of which is considered as the regular draught. A horse of this class was exhibited as a curiosity in London in the year 1805, no less than twenty hands in height. For the cart-horse see Plate LXVI. Mr. Bruce informs us, that the horses of Nubia are of unparalleled beauty; far superior, in his opinion, even to those of Arabia. He observes, however, that from the manner in which they are fed they are apt to become too fat or corpulent. The colour of the horse is not of very great importance, the most beautiful general colour seems to be bright bay, which gives an air of peculiar neatness and elegance to the animal. Black horses are commonly of large size, and in this country are chiefly used for the cart and the plough. In some countries horses are not the less esteemed for being variegated or piebald, as it is commonly termed. This is said to be the case in China.

II. *EQUUS ASINUS*, the Ass. The ass, having been long condemned to a state of the lowest servitude, and considered as a species of less dignity than the horse, has acquired, in most parts of Europe, a character of contempt. Yet in its natural or wild state

it exhibits an appearance very far superior both in point of beauty and vivacity. It is a native of many parts of Asia, living, like the rest of this genus, in a gregarious manner. It chiefly occurs in the dry and mountainous deserts of Tartary, and in the southern parts of India and Persia. It is also said to be found in Africa, and to occur, though but very rarely, in some parts of Syria and Arabia; countries where it was in ancient times extremely common. In this its natural state its colour is said to be white, or of a very pale silvery grey, with a slight tinge of straw-colour on the sides of the neck and body: along the back runs a deep-brown stripe of thickish wavy hair, to the beginning of the tail: this stripe is crossed over the shoulders, as in the tame animal, by another of similar colour; but it is said that this is peculiar to the male. The neck is furnished with a brown mane three or four inches long, consisting of soft woolly hair: the tail is tufted at the end by dusky hairs of about six inches in length: the forehead is arched, and the ears erect and pointed. The generality of European asses have large slouching ears, a heavy appearance, and are of an ash-colour, more or less deep in different individuals, with a blackish dorsal stripe, crossed by another over the shoulders, and thus exhibiting the original mark of their species. In their manners they exhibit no superior marks of sagacity, but have the merit of being patient, quiet, and tractable, and are chiefly employed in the inferior offices of servitude. The ass is observed to be very temperate in his food, and by no means delicate in the choice of it; eating thistles, and a variety of coarse herbage which the horse refuses. He is said to be particularly fond of plantain, for which he will neglect every other herb of the pasture. In his choice of water he is remarkably nice, and will drink only of that which is clear. He has also an aversion to mud or water in his road, and will pass out of the way rather than wet his feet in a puddle. He is by no means void of docility, as vulgarly supposed; but may be made to practise several exercises not usual with his race. His voice, as is well known, is a most hideous bray; a discordant succession of flats and sharps. The ass has a very fine eye, an excellent scent, and a good ear. When overloaded, he hangs his head, and sinks his ears: when too much teased or tormented, he opens his mouth and retracts his lips in a disagreeable manner, which gives him an awkward air. If you cover his eyes, he will not move another step; if you lay him on his side, and place his head so that one eye rests on the ground, and cover the other with a cloth, he will remain in this situation without making any attempt to get up. He walks, trots, and gallops, in the same manner as the horse: but all his motions are slower. Whatever pace he is going at, if pushed he instantly stops. Mules are the offspring of the horse and ass, or the jack-ass and mare. Mr. Pennant mentions a mule produced between a jack-ass and a female zebra. The ass, like the horse, continues growing three or four years, and lives till he is 25 or 30: he sleeps less than the horse, and never lies down but when excessively fatigued. He is more robust, and less subject to disease, than the horse. In America there were originally no asses, but they were carried thither by the Spaniards, and afterwards by other nations, where they multiplied greatly; inasmuch, that, in some places, there are whole droves of them that run wild, and are not easily caught. Asses in general carry the heaviest burdens in proportion to their bulk; and, as their keeping costs little or nothing, it is surprising that they are not put to more uses than they generally are among us. The flesh of the common ass is never eaten in Europe; though some say, that of their colts is tender, and not disagreeable.

III. *EQUUS BISULCUS*, the CHINESE HORSE, in the size, number, and arrangement of teeth, as well as general appearance, resembles the horse; and is therefore ranked by Dr. Gmelin in this genus, though it differs from all the other species in having cloven hoofs. In its size, hair, colour, nose, eyes, neck, back, tail, legs, and internal structure, it resembles the ass, but wants the dusky cross on its shoulders. It resembles the horse in the figure of its ears, and the sound of its voice. Hence Mr. Kerr supposes, it may be only a wild horse, degenerated through the inclemency of the mountainous district it inhabits, in the Andes, in S. America; and that "the circumstance of its having cloven hoofs may be exaggerated, or only a mistake."

IV. *HEMIONUS* of Pallas, the *Ἡμιονος*, or half-ass, of Aristotle and Pliny, the *Czigithai* of Buffon, and the *Dshikketi*, of Fœculd or Wild Mule of Pennant, is of the size and appearance of the common

common mule; with a large head, flat forehead growing narrow toward the nose; eyes of a middle size, the irides of an obscure ash colour; 38 teeth in all, being two in number fewer than in a common horse; ears much longer than those of a horse, quite erect, lined with a thick whitish curling coat; neck slender, compressed; mane upright, short, soft, of a greyish colour; in place of the foretop, a short tuft of downy hair about an inch and three quarters long. This species inhabits the deserts between the rivers Onon and Argun in the most southern part of Siberia, and extends over the vast plains and deserts of western Tartary, and the celebrated sandy desert of Gobi, which reaches even to India. In Siberia they are seen only in small numbers, as if detached from the numerous herds to the south of the Russian dominions. These animals always carry their heads horizontally; but when they take to flight, hold them upright, and erect their tail. Their neighing is deeper and louder than that of a horse. They fight by biting and kicking, as usual with the horse: they are fierce and untameable; and even those which have been taken young, are so intractable as not to be broken by any art which the wandering Tartars could use. Its swiftness exceeds that of the antelope; it is even proverbial; and the inhabitants of Thibet, from the fame of its rapid speed, mount on it Chammo, their god of fire. The Mongolians despair of ever taking them by the chase; but lurk behind some tomb, or in some ditch, and shoot them when they come to drink or eat the salt of the desert. They are excessively fearful animals, and provident against danger. A male takes on him the care of the herd, and is always on the watch. If they see a hunter, who by creeping along the ground has got near them, the centinel takes a great circuit, and goes round and round him, as discovering somewhat to be apprehended. As soon as the animal is satisfied, it rejoins the herd, which sets off with great precipitation. Sometimes its curiosity costs its life; for it approaches so near as to give the hunter an opportunity of shooting it. But it is observed, that in rainy or in stormy weather, these animals seem very dull, and less sensible of the approach of mankind. The Mongolians and Tungusi, according to Du Halden, kill them for the sake of their flesh, which they prefer to that of horses, and even to that of the wild boar, esteeming it equally nourishing and wholesome.

V. E. QUAGGA, the **QUACNA**, is striped like the zebra on the head and body, but with fewer lines. The flanks are spotted; the rump is plain; the ground colour of the head, neck, body, and rump, a bright bay: the belly, thighs, and legs, are white, and free from all marks. This species, till of late, has been supposed to be the female of the zebra; but recent observations prove that the male and female zebra are marked alike. This differs likewise in being thicker and stronger made, and in being more tractable.

VI. E. ZEBRA has the figure and gracefulness of the horse, joined to the swiftness of the stag. He is about seven feet long, from the point of the muzzle to the origin of the tail, and about four feet high. The colour of his skin is beautiful and uniform, consisting of alternate parallel rings of black and white, disposed in the most regular manner, as represented in Plate LXVI. He is generally less than the horse, and larger than the ass. The zebra is found no where but in the E. and S. provinces of Africa, from Ethiopia to the Cape of Good Hope, and from the Cape of Good Hope to Congo. The Dutch have been at great pains to tame and use them for domestic purposes, but with little success. The zebra is hard-mouthed, and kicks when any person attempts to touch or come near him. He is restless and obstinate as a mule; but perhaps the wild horse is naturally as untractable as the zebra; for it is probable, if he were early accustomed to obedience and a domestic life, he would become as docile as the horse.

ERA. See **ÆRA**, **EPÔCHA**, and **CHRONOLOGY**.

ERANARCA, a public officer among the ancient Greeks, whose business was to preside over and direct the alms and provisions made for the poor.

ERANTHEMUM, a genus of the monogynia order, and dianthia class of plants. Corolla quinquefid, with the tube filiform; antheræ without the tube; stigma simple. It has five species, herbs or undershrubs, natives of the Cape of Good Hope.

ERASMUS, **DESIDERIUS**, born at Rotterdam in 1467. He lost his father and mother at 14 years of age; and was committed to the care of guardians, who forced him to be an ecclesiastic, which he refused for a long time. However he was obliged to as-

sume the religious habit among the canons regular in the monastery of Stein near Tergon; but afterwards obtained a dispensation from his vows. He was the most learned man of the age in which he lived; and contributed, by his example and his writings, to the restoration of learning in the several countries in which he occasionally resided, viz. Italy, Switzerland, Holland, France, and England. With the last he was most satisfied; and found the greatest encouragement from Henry VIII, Sir Thomas More, and all the learned Englishmen of those days. He published many books; and died at Basil in 1536. He was buried honourably, and his memory is still held in veneration. He had, however, many enemies; and as he did not embrace the reformation, and yet censured many things in popery, he has been treated injuriously both by Catholics and Protestants. The works of Erasmus in 10 vols. folio, were published at Leyden in 1706, in a very handsome manner, under the care of M. Le Clerc. Dr. Jortin published his life in one vol. 4to. 1758.

ERASED. See **COUPED**.

ERASTIANS, a religious sect which arose in England during the time of the civil wars in 1647, thus called from their leader Thomas Erastus, whose distinguishing doctrine it was, that the church had no right to discipline, that is, no regular power to excommunicate, exclude, censure, absolve, decree, or the like.

ERATO, [from *ἔρω* I love,] in mythology, the Muse who presided over love poetry. There was also a Nereid of this name.

ERATOSTHENES, a Cyrenean philosopher, historian, and poet; stiled for his learning Plato Minor. He was keeper of the famous library at Alexandria: and was greatly in favour with Ptolemy Evergetes, by whose order he wrote a history of the Theban kings of Egypt, which succession had been entirely omitted by Manetho. He thus fixed the Egyptian chronology, and his authority is by many preferred to that of Manetho. He wrote many other things, a catalogue of which is to be seen in Fabricius, Vossius, &c. but his only piece now remaining entire is a description and fabulous account of the stars. He starved himself in old age through grief for the dimness of his sight, about the 10th or 12th year of Ptolemy Epiphanes, B. C. 194.

ERBACH, a mountainous county of Germany, in the circle of Franconia, 21 miles long, and 18 broad; containing mines of silver, copper, lead, iron, and mercury; and producing wheat, oats, wood, &c.

ERBACH, the capital of the county, 16 miles N. N. E. of Heidelberg.

EREBUS, [*Ἔρεβος*, from *εἶναι*, night,] in mythology, a term denoting darkness. According to Hesiod, Erebus was the son of Chaos and Nox, or Night, and the father of Dies, or Day.

EREBUS was also part of the infernal regions among the ancients. They had a peculiar expiation for those who were detained in Erebus. It was properly the gloomy region, and distinguished both from Tartarus, the place of torment, and Elysium, the region of bliss.

ERFORT, or **ERFURT**, a town of Germany in the late circle of Upper Saxony, the capital of Thuringia, and subject to the elector of Mentz. Lon. 11. 23. E. Lat. 51. 0. N.

ERGASTULUM, in Roman antiquity, a prison, work-house, or house of correction, where slaves by the private authority of their masters were confined and kept for their offences to hard labour. The Greeks had a place of confinement of this sort, called *Εργαστήριον*.

ERICA, **HEATH**: in botany, a genus of the monogynia order, and octandria class of plants; natural order, Bicornes. Calyx tetraphyllous; corolla quadrifid; filaments inserted into the receptacle; antheræ bifid; capsule quadrilocular. It has eighty-four species.

ERIDANUS, in ancient geography, a river of Attica, falling into the Ilissus.

ERIDANUS, the ancient name of the Padus or Po, an appellation ascribed by Pliny to the Greeks; followed in this by Virgil.

ERIDANUS, in astronomy, a constellation of the southern hemisphere, in form of a river.

ERIE, an extensive lake of N. America, near 300 miles long, and 40 broad, at its broadest part. Its form is elliptical, but a point of land projects into it from the N. side for several miles towards the S. E. It receives its waters on the W. by the Detroit from Lakes Superior, Michigan, and Huron; and on the N. E. communicates

communicates with Lake Ontario by the Niagara. The line of division, between the United States and Upper Canada, runs through it. Its navigation is rendered dangerous by numerous projections of perpendicular craggy rocks into the water from its N. shore for many miles; and its banks and island on the W. are equally dangerous to land on, being much infested with rattlesnakes, and a peculiar species of poisonous reptile, called the Hissing Snake.

ERIE FORT, a strong fort of Upper Canada, on the N. coast of Lake Erie, and W. bank of the Niagara, 27 miles S. by E. of Fort Niagara. Lon. $78^{\circ} 20' 30''$ W. Lat. $42. 59. N.$

ERIGERON, **FLEA-BANE**, in botany, a genus of the polygamia superflua order, and syngenesia class of plants; natural order, Compositæ. Receptacle naked; pappus hairy; florets of the radius linear, and very narrow. There are thirty species.

ERIGONE, in fabulous history, the daughter of Icarus, died of grief for her father's death, was translated into heaven, and made the sign Virgo.

ERIN, an ancient name of Ireland.

ERINACEUS, the **HEDGEHOG**, in zoology, a genus of quadrupeds of the order, Feræ. Generic character: two fore-teeth, both above and below, those of the upper jaw distant, those of the lower approximated; five tusks on each side of the upper jaw, three on each side of the lower; four grinders on each side, both above and below; body covered on the upper part with spines. There are six species.

1. **E. EUROPEUS**, **COMMON** or **EUROPEAN HEDGEHOG**, is found in most of the temperate parts of Europe and Asia, and, according to Mr. Pennant, is also seen in Madagascar. It commonly measures about 11 inches in length. Its colour is generally grey-brown, but it sometimes is found totally white, or of a yellowish white. It feeds principally on the roots of vegetables; but it also eats worms, as well as beetles and other insects. It wanders about chiefly by night, and during the day conceals itself in its hole, under the roots of some tree, or mossy bank. It produces four or five young at a birth, which are soon covered with prickles like those of the parent animal, but shorter and weaker. The nest is large, and is composed of moss. The hedgehog, when disturbed rolls itself up into a globular form, and thus presents to its adversary an invulnerable ball of prickles. From this state of security, it is not easily forced; scarcely any thing but cold water obliging it to unfold itself. It swims perfectly well when thrown into water. The hedgehog is one of those animals which, during the winter, are supposed to continue in a state of torpidity. In that season it lies concealed in its hole, surrounded with a bed of moss, secure from the rigours of the most piercing frost, and at the return of spring recommences its wanderings. The hedgehog may be rendered in a considerable degree domestic; and has frequently been introduced into houses for the purpose of expelling those troublesome insects the blattæ, or cockroaches, which it pursues with avidity, and is fond of feeding on. It is itself an occasional article of food in some places, and is said to be best in the month of August. The hedgehog is generally considered as a harmless inoffensive animal, but has been frequently supposed (and to this day the absurd notion prevails in many places) to suck the teats of cows by night, and thus cause by its prickles those excruciations which are sometimes seen on cattle. From this accusation, however, it is completely absolved by Mr. Pennant, who observes, that its mouth is by far too small to admit of this practice. See Plate LXVI.

2. **E. AURITUS**, the **LONG-EARED URCHIN** of Pallas and Gmelin, or **SIBERIAN HEDGEHOG** of Pennant, has long oval ears, nostrils crested at the edges, and all the manners of the European. It inhabits Asiatic Russia, near the Volga and Ural, where it is smaller than the European, and beyond lake Baikal, where it is larger.

3. **E. ECAUDATUS**, the **TANREC** of Buffon, and **ASIATIC HEDGEHOG** of Pennant, is nearly as large as a rabbit, and has a very long slender muzzle, but no tail. It inhabits India and Madagascar.

4. **E. INAURIS**, the **WHITE AMERICAN URCHIN** of Seba, or **GUIANA HEDGEHOG** of Pennant, is 8 inches long, and has no external ears. It is a native of S. America.

5. **E. MALACCENSIS**, the **MALACCA URCHIN** of Brisson, or **SHORT-TAILED PORCUPINE** of Linnaeus, has pendulous ears, and

inhabits Asia. From this species is procured the Piedra del Porco, formerly much esteemed, supposed by Mr. Kerr, to be a kind of Bezoar. See Plate LXVI.

6. **SETOSUS**, the **TENDRAC**, has spines only on the head, neck, tail, and withers; is scarce six inches long, and inhabits India and Madagascar.

ERINNYIS, [*Erinnyis*, i. e. an avenger of crimes.] in mythology, a name common to the Furies. See **FURIES**.

ERINUS, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order, Personatæ. Calyx pentaphyllous; corolla border quinquefid and equal; with its lobes emarginated, upper lip very short and reflexed; capsule bilocular. Thirteen species chiefly natives of Africa.

ERIOCAULON, in botany, a genus of the trigynia order, and triandria class of plants; natural order, Eusatæ. The common calyx is an imbricated capitulum or knob; there are three equal petals; and the stamina are on the germen. It has six species.

ERIOCEPHALUS, in botany, a genus of the polygamia necessary order, and syngenesia class of plants; natural order, Compositæ. Receptacle somewhat villous; no pappus; calyx deca-phyllous and equal; the radius has five florets. Two species, natives of the Cape of Good Hope.

ERIOPHORUM, a genus of the monogynia order, and triandria class of plants; natural order, Calamariæ. Glumes paleaceous, imbricated all around; no corolla; seed one, furnished with a very long down. There are six species.

ERIOSPERMUM, in botany, a genus of the hexandria monogynia class and order. Corolla six-petaled, campanulate, permanent; filaments dilated at the base; capsule three-celled; seeds invested with wool. There are three species.

ERIOSTEMUM, in botany, a genus of the decandria monogynia class and order. Calyx five-parted; petals five, sessile; stamina flat, ciliate; antheræ pedicelled terminal; style from the base of the germ; capsules five, united, seated on a nectary covered with protuberances; seeds coated. One species, viz. *E. australasia*.

ERIPHYLE, in fabulous history, the sister of Admetus king of Argos, wife of Amphiaræus, and daughter of Talæus and Lisi-mache.

ERIS, or **ATE**, the goddess of Discord among the Greeks, and the Discordia of the Latins. She was represented by Aristides, with fiery eyes, a pale countenance, livid lips, and wearing a dagger in her bosom.

ERISICHTHON, in fabulous history, a Thessalian, son of Triops, who derided Ceres, and cut down her groves. This impiety irritated the goddess, who afflicted him with continual hunger.

ERITHALIS, a genus of the monogynia order, and pentandria class of plants. Corolla quinquepartite; calyx bladder-like; berry decemlocular, inferior. It has two species.

ERIVAN, a city of Persia, in Asia, and capital of Persian Armenia. It is a large, dirty, ill-looking place, in which there are no handsome buildings, the houses being very mean, and raised with earth or mud; but it is full of gardens and vineyards. Lon. $44. 50. E.$ Lat. $40. 20. N.$

ERIVAN, **PERSIAN ARMENIA**, or **GREATER ARMENIA**, a province of Persia, 600 miles long, and 180 broad, of which the above city is the capital.

ERIVAN, an extensive lake in the above province, 60 miles in circumference.

ERKELENS, a town of Germany, 10 miles N. W. of Juliers.

ERLANG, a town of Germany, in the circle of Franconia, 12 miles N. W. of Nuremberg.

ERMELAND, a province of Prussia. The chief towns are Frauenbourg, Braunsberg, and Heilsburg.

ERMINE, in zoology. See **MUSTELA**.

ERMINE, or **ERMIN**, in heraldry, denotes a white field or fur, powdered or interspersed with black spots, called powdering. It represents the skin of an animal so named. There is, however, no animal whose skin naturally corresponds to the herald's ermin. The animal is milk white; and so far from having spots, that tradition reports, it will rather die or be taken, than sully its whiteness; hence its symbolical use. But white skins having for ages been used for the linings of the robes of magistrates and great men, the furriers, to add to their beauty, sewed bits of the black tails of those creatures upon the white skins; which alteration was introduced

duced into heraldry. The sable spots in ermine are not of any determinate number, but may be more or less at the pleasure of the painter or furrier.

ERMINE, an order of knights, instituted in 1450 by Francis I. duke of Bretagne, and formerly subsisting in France.

ERMINES, in heraldry, the reverse of ermine, *i. e.* white spots on a black field.

ERNODEA, in botany, a genus of the tetrandria monogynia class and order. Calyx four-parted; corolla one-petaled, salver-shaped; berry two-celled; seeds solitary. One species, viz. *E. littoralis*, a native of Jamaica.

ERODIUM, CRANES-BILL, in botany, a genus of the monadelphia pentandria class and order. Calyx five-leaved; corolla five-petaled; nectary five scales, alternate with the filaments and glands at the base of the stamens; fruit five-grained, with a spiral beak, bearded on the inside. There are twenty-eight species.

ERODIUS, a genus of insects of the order coleoptera. Antenna moniliform; feelers filiform; body roundish, gibbous, immarginate; thorax transverse; shells closely united, longer than the abdomen; jaw horny, bifid; lip horny, emarginate. There are four species.

EROS, [*ἔρως, i. e.* love,] in mythology, one of the two chiefs over all the other Cupids, being the cause of love.

EROTEUM, a genus of the class and order pentandria monogynia. Calyx five-leaved; corolla five-petaled; the style trifid; berry juiceless, three-celled, many-seeded. There are two species, natives of Jamaica.

EROTIA, a festival in honor of Eros, celebrated by the Thespians every fifth year with sports and games.

EROTIC, [*ἔρωτικός, from ἔρως, love*] of, or belonging to love.

EROTICUM DELIRIUM, in medicine, a kind of melancholy contracted through excess of love.

ERPACH, a county of Germany, in Suabia.

ERPACH, a town and castle in the above county, 8 miles S. E. of Ulm.

ERQUIKO, a sea-port of Africa, on the coast of Abex, on the Red Sea; 320 miles S. W. of Mecca. Lon. 39. 5. E. Lat. 17. 30. N.

ERRHINE, [*ἔρρινη, from ἔρρω, to promote*], in pharmacy, medicines which when snuffed up the nose promote a discharge of mucus. These are more friendly to the constitution and nerves than sternutatories, by their subtle, acrid, and volatile salt, gently stimulating the pituitary membrane, and drawing the mucid humour from it. They are also much safer. Those prepared of cephalic herbs are of singular service in oppressive pains of the head, hermicrania, lethargic disorders, weaknesses of memory, stuffings of the head, and coryza, mucous deluxions of the eyes, drowsiness, vertigoes, and in cases where the malignant humours generated by the lues venerea are lodged in the membranes of the nostrils.

ERRHINES, MILD, are marjoram, basilicon, thyme, hyssop, savory, marum syriacum, the tops of origanum, flowers of lilies of the valley, and gum benzoia, the resin of guaiacum, fine raspings of aloes wood, dry volatile salt of sal ammoniac, perfumed with oil of marjoram, and white vitriol.

ERRHINES, VIOLENT, are, euphorbium, the powder of white hellebore, several sorts of snuffs, precipitate mercury, turbit mineral, and pepper.

ERROUR, or ERROR, in philosophy, a mistake of our judgement, giving assent to that which is not true. Mr. Locke reduces the causes of error in philosophy, to these four; 1st, want of proofs; 2dly, want of ability to use them; 3dly, want of will to use them; and, 4thly, wrong measures of probability. He observes upon the first of these, that the greatest part of mankind want conveniences and opportunities of making experiments and observations themselves, or of collecting the testimonies of others, being prevented by the necessity of their condition. Upon the 2nd, he observes, that there are many, who, from the state of their condition, might bestow time in collecting proofs, but yet are not able to carry a train of consequences in their heads, nor weigh exactly the preponderancy of contrary proofs and testimonies, merely from the difference in men's understandings, apprehensions, and reasonings. He remarks, 3dly, that though some have opportunities and leisure enough, and want neither parts, learning, nor other helps, that they never come to the knowledge of several truths within their reach, either upon account of their attachment to pleasure or business; or otherwise because of their laziness or aversion to study. The 4th cause of error he imputes, 1. To the

practice of taking for principles propositions that are not in themselves certain and evident, but, on the contrary, doubtful and false. 2. To received hypotheses. 3. To predominant passions or inclinations. And, 4. To authority, or the giving up of our assent to the common received opinions either of our friends or party, neighbours or country. The causes of error in philosophy, or the reasons why all former philosophers have through so many ages erred, according to Lord Bacon, are these following: 1. Want of time suited to learning. 2. The little labour bestowed upon natural philosophy. 3. Few entirely addicted to natural philosophy. 4. The end of the sciences wrong fixed. 5. A wrong way chosen. 6. The neglect of experiments. 7. REGARD to antiquity and authority. 8. Admiration of the works in use. 9. The artifice of teachers and writers in the sciences. 10. Ostentatious promises of the moderns. 11. Want of proposing worthy tasks. 12. Superstition and zeal being opposite to natural philosophy, as thinking philosophy dangerous, on account of the school theology; from the opinion that deep natural inquiries should subvert religion. 13. Schools and academies proving unfavourable to philosophy. 14. Want of rewards. And, 15. Despair, and the supposition of impossibility.

ERROR LOCI, *i. e.* ERROR OF PLACE, a term introduced into medicine by Boerhaave, from the opinion that the vessels were of different sizes for the circulation of blood, serum, and lymph; and that when the larger sized globules were forced into the less vessels by an error of place, they were obstructed. But this opinion is now exploded.

ERROR, in law, signifies an error in pleading, or in the process; and the writ which is brought for remedy thereof, is called a writ of error. A writ of error is a commission to judges of a superior court, by which they are authorized to examine the record upon which a judgement was given in an inferior court, and on such examination, to affirm or reverse the same according to law. Jenk. Rep. 25. For particulars as to the practice of writs of error, see Impey's K. B. and C. P.

ERSE, or GAELIC LANGUAGE. See GAELIC.

ERUCA, the general name of caterpillars of all kinds. The caterpillar state is that through which every butterfly must pass before it arrives at its perfection and beauty: and, in the same manner, all the known winged animals, except only the puceron, pass through a reptile state; none else being produced in their winged form. The change from caterpillar to butterfly was long esteemed a metamorphosis, a real change of one animal into another; but this is not the case. The egg of a butterfly produces a butterfly, with all the lineaments of its parent; only these are not disclosed at first, but for the greater part of the animal's life are covered with a case or muscular coat, in which are legs for walking, which only suit it in this state; but its mouth takes in nourishment, which is conveyed to the included animal; and after a proper time this covering is thrown off, and the butterfly, which all the while might be discovered in it by an accurate observer with the help of a microscope, appears in its proper form. Before it passes into this state, however, there requires a state of rest for the wings to harden, and the other parts to acquire their proper firmness; this is transacted in a time of perfect rest, when the animal lies in what is called the nymph or chrysalis state, in appearance only a lump of inanimate matter. There is a determined time for each of these changes in every species; but, in the several different kinds, the periods are very different. There is no sign of sex in the animal while in the caterpillar state: the propagation of the species is the business of the creature in its ultimate perfection; and till that, these parts are never excluded; one female butterfly, when she has been impregnated by the male, will produce 300 or 400 eggs, or even more. There is no way of knowing the sexes of these little creatures by viewing the parts; but the whole figure and manner of the animal shews the difference. The females are always larger than the males; they are also more slow in their motions; and some of them have no wings, or, at the most, only very small ones. The males, however, have a sort of beards, more beautiful than the antennæ or horns of the females: the female is much stronger as well as bigger than the male; and often, in case of danger or disturbance, she flies away with him in time of copulation. On dissecting the female, her uterus affords an astonishing sight. The number of eggs in the tubes is amazing: but these have not all the same figure; and, in some species, as the silk-worm, &c. the eggs are of a beautiful blue;

blue; if any yellowish ones are seen among them, they are judged to be defective. The care of all the butterfly tribe to lodge their eggs in safety is surprising. Those whose eggs are to be hatched in a few weeks, and who are to live in the caterpillar state during part of the remaining summer, always lay them on the leaves of such plants as will afford a proper nourishment, but those, whose eggs are to remain unhatched till the following spring, always lay them on the branches of trees and shrubs, and usually select such places as are least exposed to the rigour of the ensuing season, and frequently cover them from it in an artful manner. Some make a general coat of a hairy matter over them, taking the hairs from their own bodies for that purpose; others hide themselves in hollow places in trees, and in other sheltered cells, and there live in a kind of torpid state during the whole winter, that they may deposit their eggs in the succeeding spring, at a time when there will be no severities of weather for them to combat. The day butterflies only do this, and of these but a very few species; but the phalænæ, or night ones, all without exception, lay their eggs as soon as they have been in copulation with the male, and die immediately afterwards.

ERUDITION, implies chiefly the knowledge of history and antiquity, of languages and of books. The Scaligers were men of deep erudition: the writings of M. Launoy, a priest of the Oratory, are full of erudition. Mr. Locke says, it is of more use to fill the head with reflections than with points of erudition. M. Balzac calls a heap of ill chosen erudition the luggage of antiquity.

ERUPTION, in medicine, a sudden and copious excretion of humours, as pus or blood: it signifies also the same with exanthema, any breaking out, as the pustules of the plague, small-pox, measles, &c.

ERVUM, the **LENTIL**; a genus of the decandria order, and diadelphia class of plants; natural order, Papilionaceæ. Calyx five-parted, the length of the corolla. There are six species; of which the *E. lens*, the common lentil, is cultivated in many parts of England, either as fodder for cattle, or for the seeds which are used in meagre soups.

ERYMANTHUS, in ancient geography, a mountain, river, and town of Arcadia, where Hercules is said to have killed a prodigious boar, which he carried on his shoulders to Eurytheus; who was so terrified at the sight, that he hid himself in a brazen vessel.

ERYNGIUM, **ERYNGO**, or **SEAHOLLY**, a genus of the dignity order, and pentandria class of plants; natural order, Umbellatæ. Flowers collected into a round head; receptacle paleaceous. There are eleven species; most of which are hardy herbaceous perennials, producing erect stalks from one to two or three feet high; with simple, entire, or divided prickly leaves; and the stalks terminated by roundish aggregate heads of quinquepetalous flowers, of white, blue, or purple colours. They all flower mostly in July, and the seeds ripen in September.

ERYSIMUM, **HEDGE MUSTARD**: a genus of the siliquosa order, and tetradynamia class of plants; natural order, Siliquosæ. Siliqua long, linear, and exactly tetragonal; calyx close. It has eight species.

ERYSIPELAS, [*erysipelas*], an erysipelas is generated by a hot serum in the blood, and affects the superficies of the skin with a shining pale red, and citron colour, without pulsation or circumscribed tumour, spreading from one place to another. See **MEDICINE**.

ERYTHRÆ, in ancient geography, three towns: 1. in Ætolia, on the Corinthian bay: 2. in Beotia, near Plataea and mount Cithæron: 3. in Ionia, on the peninsula, at its extremity; with 4. a cognominal port. It was famous for an ancient temple of Hercules.

ERYTHRÆA, a surname of the Sybil Herophile, from her birth-place, Erythræ in Ionia.

ERYTHRÆUM MARE, erroneously called **Rubrum**, or the **Red Sea**, by the Romans. Thus, the ocean that washes Arabia and Persia, and extends a great way farther, is denominated. Hence Herodotus says, that the Euphrates and Tigris fall into the **Mare Erythræum**. It is named from

ERYTHRAS, the son of Perseus and Andromeda, whose kingdom lay on the confines of that sea.

ERYTHRINA, **CORAL TREE**: a genus of the decandria order, and diadelphia class of plants; natural order, Papilionaceæ.

Calyx bilabiate, the one lip above, the other below; vexillum of the corolla very long and lanceolated. There are seven species, shrubby flowering exotics for the stove, adorned chiefly with trifoliate leaves, and scarlet spikes of papilionaceous flowers. They are natives of the warm parts of Africa and America; and must always be kept in pots, which remain constantly in stoves in this country.

ERYTHROIDES, in anatomy, the first of the proper coats which cover the testicles.

ERYTHRONIUM, **DOG'S-TOOTH VIOLET**: a genus of the monogynia order, and hexandria class of plants; natural order, Samentaceæ. Corolla hexapetalous, campanulated; with a nectarium, tubercles two, adhering to the inner base of every other petal. There is only one species, which, however, admits of several varieties in its flowers, as white, purple, pale red, dark red, crimson, and yellow.

ERYTHROXYLON, in botany, a genus of the trigynia order, and decandria class of plants. Calyx turbinate; corolla having each a nectariferous emarginated scale at the base; stamina connected at the base; fruit a bilocular plum. It has five species.

ERYX, in fabulous history, a son of Butes and Venus, who relying upon his strength, challenged all strangers to fight with him in the combat of the cestus. He was killed in the combat, by Hercules, who had accepted his challenge.

ERZERON, or **ERZERUM**, a city of Turkey in Asia, the capital of Turcomania; five days journey from the Black Sea, and 10 from the frontiers of Persia. Lon. 40. 41. E. Lat. 39. 57. N.

ERZGEBIRG, or **ERZGEBURG**, a territory of Germany, in Upper Saxony, surrounded by those of Leipsic, Meissen, Vogtlandt, Neustadt, Bohemia, and Altenburgh.

ESARHADDON, or **ASAR-ADDON**, the son of Sennacherib, and his successor in the kingdom of Assyria, about B. C. 712. He united the kingdoms of Nineveh and Babylon; conquered Ethiopia and Syria; sent a colony to Samaria; and his generals took king Manasseh, and carried him in chains to Babylon. He reigned 29 years at Nineveh, from A. M. 3294 to 3322; and 13 at Babylon; in all 42 years. He died A. M. 3336, and was succeeded by Sardanapalus. Esarhaddon, in the opinion of Sir Isaac Newton, is the Sardanapalus who died, as Clectarchus says, of old age, after the revolt of Syria; the name Sardanapalus being derived from Asserhadon Pul.

ESAU, [עֵשָׂו, Heb. i. e. doing.] See **EDOM**.

ESAU, a mountain of Arabia, in Yemen, 4 miles N. of Udden.

ESACENA, a town of Spain, in Seville, 20 miles W. of Seville.

ESCALLONIA, a genus of the monogynia order, and pentandria class of plants. Fruit bilocular, polyspermous; petals distant, tongue-shaped; stigma headed.

ESCALONA, two towns of Spain; 1. in New Castile, 32 miles S. W. of Madrid: 2. in Old Castile, 14 miles N. N. E. of Segovia.

ESCAPE, in law, a violent or privy evasion out of some lawful restraint, without being delivered by due course of law. There are two sorts of escapes, voluntary and negligent.

ESCAPE, **NEGLIGENT**, is where one is arrested, and afterwards escapes against the will of the person that arrested him, and is not pursued with fresh suit, and retaken before the person pursuing hath lost sight of him. By stat. 8 and 9 Will. III. c. 26. the keepers of prisons conniving at escapes shall forfeit 500*l.* and in civil cases, the sheriff is answerable for the debt.

ESCAPE, **VOLUNTARY**, when a man arrests another for felony, or other crime, and afterwards lets him go freely by consent; in which case, the party that permits such escape is held guilty, committed, and must answer for it.

ESCAUT, or the **SCHELD**T, a department of Belgium, containing part of the late Austrian Flanders. Ghent is the capital.

ESCHALOT. See **ALLIUM**.

ESCHAR, in surgery, the crust or scab occasioned by burnt or caustic medicines. See **SURGERY**.

ESCHAROTICS, in pharmacy, medicines which produce eschars. See **ESCHAR**.

ESCHEAT, in our law, denotes an obstruction of the course of descent, and a consequent determination of the tenure by some unforeseen contingency; in which case, the land naturally results back, by a kind of reversion, to the original grantor, or lord of the fee.

fee. 2 Black. 244. Escheat happens either for want of heirs of the person last seized, or by his attainder for a crime by him committed; in which latter case, the blood is tainted, stained, or corrupted, and the inheritable quality of it is thereby extinguished. For want of heirs, is where the tenant dies without any relations on the part of any of his ancestors, or where he dies without any relations of those ancestors, paternal or maternal, from whom his estate descended, or where he dies without any relations of the whole blood. Bastards are also incapable of inheritance; and therefore if there is no other claimant than such illegitimate children, the land shall escheat to the lord; and, as bastards cannot be heirs themselves, so neither can they have any heirs but those of their own bodies; and therefore if a bastard purchases land, and dies seized thereof without issue and intestate, the land shall escheat to the lord of the fee. Aliens also, that is, persons born out of the king's allegiance, are incapable of taking by descent; and unless naturalized, are also incapable of taking by purchase; and therefore, if there are no natural-born subjects to claim, such lands shall in like manner escheat. By attainder for treason or other felony, the blood of the person attainted is corrupted and stained, and the original donation of the feud is thereby determined, it being always granted to the vassal on the implied condition of his well demeaning himself. In consequence of which corruption and extinction of hereditary blood, the land of all felons would immediately revert to the lord, but that the superior law of forfeiture intervenes, and intercepts it in his passage; in case of treason, for ever; in case of other felony, for only a year and a day; after which time it goes to the lord, in a regular course of escheat. 2 Black. c. 15.

ESCHEATOR, was an ancient officer, so called because his office was properly to look to escheats, wardships, and other casualties belonging to the crown. This office had its chief dependence on the courts of wards, but is now out of date. Co. Lit. 13. b. 4. Inst. 225.

ESCHELLES, a town in France, in the department of Mont Blanc, late Savoy, 10 miles S. W. of Chambéry.

ESCHEVIN, or ECHEVIN, [*Scabinus*, Lat.] in the late French and Dutch polity, a magistrate elected by the inhabitants of a city, to take care of their common concerns.

ESCHRAKITES, or ESRAKITES, a sect of philosophers, among the Mohammedans, who adhere to the doctrines of Plato. The word is derived from the Arabic *شراق*, *schrava*, which in the fourth conjugation *شراق*, *aschraca*, signifies to shine, or glitter, like the sun; so that Eschrakite seems to import illumined.

ESCHWEGEN, a town of Germany, in Hesse, 27 miles E. S. E. of Cassel. Lon. 10. 6. E. Lat. 51. 9. N.

ESCHWEILER, a town of France, in the department of Roer, and late duchy of Juliers, 6 miles S. of Juliers.

ESCLATTE, in heraldry, signifies a thing forcibly broken, or rather a shield that has been broken and shattered with the stroke of a battle-ax.

ESCORT, in the art of war, the same with convoy. See CONVOY.

ESCOUADE, or SQUAD, is usually the third or fourth part of a company of foot; so divided for mounting guards, and for the more convenient relieving of one another. It is equivalent to a brigade or a troop of horse. See BRIGADE.

ESCROW, among the lawyers, a deed delivered to a third person, to be the deed of the party making it upon a future condition, that when a certain thing is performed, it shall be delivered to the party to whom it was made, to take effect as the deed of the person first delivering it.

ESCUAGE, in our old customs, a kind of knight service, called service of the shield, by which the tenant was bound to follow his lord to the wars at his own charge. It is also used for a sum of money paid to the lord in lieu of such service; or even for a reasonable aid, levied by the lord upon his tenants who held by the knight's service.

ESCUBIAL, a royal residence of Spain, 15 miles N. W. of Madrid. It is the largest and most superb structure in the kingdom, and one of the finest in Europe. The word is Arabic, meaning "a place full of rocks." It is built in a dry barren spot, surrounded with rugged mountains, inasmuch that every thing which grows there is owing to art. This place was chosen, it is said, for the sake of the stone wherewith the fabric is built, which is got from a mountain just by, and is very durable; and the de-

sign for erecting it was to commemorate a victory which Philip II. obtained over the French (but by the assistance of the English forces) at St. Quintin, on St. Laurence's day, in the year 1557. The Spanish description of this structure forms a sizeable quarto volume. Its founder expended upon it six millions of ducats. The apartments are decorated with an astonishing variety of paintings, sculpture, tapestry, ornaments of gold and silver, marble, jasper, gems, and other curious stones, surpassing all imagination. This building, besides its palace, contains a church, large and richly ornamented; a mausoleum; cloisters; a convent; a college; and a library, containing about thirty thousand volumes; besides large apartments for all kinds of artists and mechanics, noble walks, with extensive parks and gardens, beautified with fountains and costly ornaments.

ESCUTCHEON, in heraldry, is derived from the French *escussion*, and that from the Latin *scutum*, and signifies the shield whereon coats of arms are represented. Most nations, of the remotest antiquity, were wont to have their shields distinguished by certain marks painted on them; and to have such on their shields was a token of honour, none being permitted to have them till they had performed some honourable action. The escutcheon, as used at present, is square, only rounded off at the bottom. As to the bearings on shields, they might at first be arbitrary, according to the fancy of the bearer; but, in process of time, they came to be the gift of kings and generals, as the reward of honourable actions.

ESCUTCHEON OF PRETENCE, that on which a man carries his wife's coat of arms, being an heiress, and having issue by her. It is placed over the coat of the husband, who thereby shews forth his pretensions to her lands.

ESDRAS, or EZRA, a Jewish priest, and doctor of the law. Artaxerxes Longimanus, sent him with rich presents for the use and ornament of the temple at Jerusalem, rebuilt under Zerubbabel; he also ordered the neighbouring governors to provide him with what conduced to the pomp of the Jewish religion, and to exempt the priests from paying taxes. Ezra is supposed to have been the collector of the Canon of Scripture; and that, by divine inspiration, he added some things which happened after the deaths of the authors. It is supposed he wrote the Chronicles, besides those books which bear his name; the two last of which are exploded as apocryphal, even by the church of Rome.

ESENS, a town of Germany, in east Friesland, 24 miles N. N. E. of Emden. Lon. 7. 14. E. Lat. 53. 47. N.

ESFARIAN, a town of Persia, 90 miles E. of Astrabad. Lon. 41. 23. E. Lat. 36. 48. N.

ESIONGABER, ASIONGABER, or EZIONGEBER, an ancient town of Arabia Petrea, on the bay of Elath, a part of the Arabian Gulf; the dock or station for the ships of Solomon and Jehoshaphat. It was afterwards called Bernice.

ESK, a river of England, in Cumberland, which runs into the Irish Sea, near Ravinlass.

ESK, BLACK and WHITE, two rivers of Scotland, in Eskdale, Dumfriesshire. Also two rivers in Angushire.

ESKI SHEHR, a town of Asiatic Turkey, in Natolia, on the Sakaria, 116 miles S. E. of Constantinople.

ESLINGEN, a large imperial town of Germany, in the late duchy of Wirtemberg, 8 miles S. E. of Stutgard.

ESOX, in ichthyology, the PIKE, a genus of fishes of the order abdominales. Head flattish above, mouth and throat large; teeth sharp, in the jaws, palate, and tongue; nostrils double, near the eyes; gill-membrane with from seven to twelve rays; body elongated; dorsal fin near the tail. Gmelin enumerates fifteen species, and Shaw twenty-two: the following are the most important.

E. LUCIUS, or the COMMON PIKE. In Lapland this fish, is frequently found eight feet long. It is to be met with in most lakes and small rivers throughout Europe. Its common colour is a pale olive, but in Holland it has been seen of an orange colour with black spots. When in its perfect state its colours are uniformly found to be most vivid. The largest pike ever caught in Great Britain is supposed to have been one which weighed thirty-five pounds. It is a fish of particularly rapid growth, and also of great longevity, having been ascertained, according to one of the natural historians of Poland, to live to the age of ninety years. The stomach of the pike is particularly strong, muscular, and extended. Its teeth, without including those nearest the throat, are

no fewer than seven hundred, and those which are placed on the jaws are alternately moveable and fixed. It is one of the most voracious of fishes, and is often found to swallow water-rats and young ducks; it has even attacked the swan, and swallowed the head and great part of the neck of that bird; but being unable to separate these from the body, it became, in this instance, the victim of its voracity.

E. BELONE, the **GAR**, or **SEA NEEDLE**, sometimes grows to three feet or more. The jaws are very long, slender, and sharp-pointed; the under jaw extends much farther than the upper; and the edges of both are armed with numbers of short and slender teeth: the tongue is small: the eyes are large; the irides silvery; and the nostrils wide and round. The body is slender, the belly quite flat, bounded on both sides by a rough line.

E. STOMIAS, or the **PIPER-MOUTHED PIKE**, is a native of the Mediterranean sea, about eighteen inches in length, and of a greenish brown colour. Its lower jaw is considerably longer than the upper; it has two fore-teeth in the upper, and these with two of the under, project from the mouth when shut; a specimen of it is to be seen in the British Museum.

ESPALIERS, in gardening, are rows of trees planted about a whole garden or plantation, or in edges, so as to inclose quarters or separate parts of a garden; and are trained up regularly to a lattice of wood-work in a close hedge, for the defence of tender plants against the injuries of wind and weather. They are of admirable use and beauty in a kitchen-garden, serving not only to shelter the tender plants, but screen them from the sight of persons in the walks.

ESPALION, a town of France, in the department of Aveiron, 12 $\frac{1}{2}$ miles N. N. E. of Rhodéz.

ESPAMISCACK, a lake of Lower Canada, 222 miles N. E. of Quebec. Lon. 68. 0. W. Lat. 50. 0. N.

ESPLANADE, in fortification, the stopping of the parapet of the covered way towards the campaign. It is the same with glacis, but begins to be antiquated, and is more properly the empty space betwixt a citadel and the houses of a town, commonly called a place of arms. See **FORTIFICATION**.

ESPLEES, in law, the general products which lands yield, or the profit or commodity that is to be taken or made of a thing.

ESPOSENDA, a sea-port town of Portugal, in Entre-Duero-e-Minho, 22 miles N. of Oporto.

ESPOSENDA, a town of Spain, in Gallicia, 12 miles S. W. of Orense.

ESPOUSALS, in law, signify a contract or promise made between a man and a woman, to marry each other; and in cases where marriage may be consummated, espousals go before. Marriage is termed an espousal de presenti.

ESPOUSALS among the Jews, were either by writing, or by a piece of silver given and received, or by cohabitation. Among the Greeks, after the parents and friends of the young couple had finished their negotiation, the couple themselves pledged their faith to each other, the man swearing that he would be constant and true, the woman that she would marry him, and make him master of all she had. Then they ratified their agreement by a kiss and joining right hands. Among the Romans the espousals consisted in an engagement of friends on both sides, whether absent or present, in public or without witnesses. But the common way was by writings drawn up by common consent, and sealed by both parties; the man also sent a ring to the woman, consisting of iron and without a stone.

ESQUILÆ, **ESQUILINE**, or **ESQUILINUS MONS**, in ancient geography, one of the seven hills of Rome, which Varro will have to consist of two, viz. Cispius and Opus.

ESQUIMAUX, a people of North America inhabiting all that vast tract of land called Labrador, or New Britain. They differ very considerably, both in aspect and behaviour, from the other American nations; agreeing in most respects with the inhabitants of West Greenland.

ESQUIRE is derived from the French *escu*, and the Latin *scutum*, in Greek *ταυτο*, which signifies a hide, of which shields were anciently made, and afterwards covered: for, in the time of the Anglo-Saxons, the shields had a covering of leather. An esquire, or Squire was originally a person who, attending a knight in time of war, carried his shield; whence he was called *escuier* in

French, and *escutifer*, or *armiger*, i. e. armour-bearer, in Latin. This title has not, for a long time, had any relation to the office of the person, as to carry arms, &c. Those to whom the title of esquire is now of right due, are all noblemen's younger sons, and the eldest sons of such younger sons; the eldest sons of knights, and their eldest sons; the officers of the king's courts, and of his household: counsellors at law, justices of the peace, &c. though those latter are only esquires in reputation: besides, a justice of the peace holds this title no longer than he is in commission, in case he is not otherwise qualified to bear it: but a sheriff of a county, who is a superior officer, retains the title of esquire during life, in consequence of the trust once reposed in him: the heads of some ancient families are said to be esquires by prescription.

ESQUIRES OF THE KING are such as have that title by creation, wherein the form used is, to put about their necks a collar of SS, and bestow on them a pair of silver spurs, &c.

ESQUIRES OF THE KNIGHTS OF THE BATH are constituted by these knights, each knight of the Bath constituting three esquires, at his installation.

ESQUISSE, [Fr. a sketch,] in painting, the first slight sketch or draught of a picture.

ESSAY, in literature, a peculiar kind of composition, the character whereof is to be free, easy, and natural; not tied to strict order or method, not worked up and finished like a formal system.

ESSAY-BALANCE. See **BALANCE**.

ESSAY-HATCH is the miner's term for a little trench or hole, which they dig to search for shoad or ore.

ESSAYING, or **ASSAYING**, in chemistry and metallurgy. See **ASSAYING**.

ESSEDARI, a sort of gladiators, mentioned by Seneca, Suetonius, and Tully, who on some occasions engaged one another out of chariots called *essedæ*.

ESSEDUM, a sort of heavy chariot from which the Gauls and Britons engaged the Romans.

ESSEN, three towns of Germany in Westphalia.

ESSENCE, in chemistry, denotes the purest, most subtle, and balsamic part of a body; extracted either by simple expression, or by means of fire, from fruits, flowers, and the like. Of these there are a great variety, used on account of their agreeable smell and taste, by apothecaries, perfumers, and others. Those extracted by means of fire, with more propriety are to be counted among the essential oils.

ESSENCE OF BERGAMOT, is a fragrant essence, extracted from a fruit which is produced by grafting a branch of lemon-tree, upon the stock of a bergamot-pear. It is imported from Italy and Sicily, particularly from Reggio and Messina. This spirit is extracted, by paring off the rind of the fruit with a broad knife, pressing the peel between wooden pincers against a sponge, and as soon as the sponge is saturated, the volatile liquor is squeezed into a phial.

ESSENCE OF ORANGE, and **ESSENCE OF LEMON**, are prepared in a similar manner, and come from the same countries.

The **ESSENCES OF LAVENDER**, of **THYME**, of **ROSEMARY**, of **ANISE**, of **CLOVES**, of **CINNAMON**, &c. are obtained by means of fire.

ESSENCE, in metaphysics, that which constitutes the particular nature of each genus or kind, and distinguishes it from all others; being nothing but that abstract idea to which this name is affixed, so that every thing contained in it is essential to that particular kind. This Mr. Locke calls the nominal essence; in contradiction to the real essence, or constitution of substances, on which this nominal essence depends. Thus the nominal essence of gold is that complex idea the word gold stands for; as implying a body, yellow, weighty, malleable, fusible, and fixed; but its real essence is the constitution of its insensible parts, on which these qualities and all its other properties depend, which is wholly unknown to us.

ESSENDI QUIETUM DE THEOLONIO, a writ that lies for citizens and burgesses of any city or town, that have a charter on prescription to exempt them from toll through the whole realm, if it happened to be any where exacted of them.

ESSENEs, or **ESSENIANS**, in Jewish antiquity, one of the three ancient sects among that people. They allowed a future state, but denied a resurrection from the dead. Their way of

life was very singular: they did not marry; but adopted the children of others, whom they bred up in the institutions of their sect; they despised riches, and had all things in common; and never changed their cloaths till they were entirely worn out.

ESSENTIAL, something necessarily belonging to the essence or nature of a thing, from which it cannot be conceived distinct: thus the primary qualities of bodies, as extension, figure, number, &c. are essential or inseparable from them in all their changes and alterations. See **QUALITY**.

ESSENTIAL OILS are such as are really contained in a plant, and are drawn from it by distillation in an alembic with water; they are thus called, in contra-distinction to empyreumatic oils, which are raised by a naked fire without water.

ESSEX, a county of England, bounded on the N. by part of Cambridgeshire, and by the river Stour, which separates it from Suffolk; on the E. by the German Ocean; on the S. by the Thames, which divides it from Kent; and on the W. by Herts and Middlesex; being divided from the former, in one part by the Stort, and then by the Lea, which separates it likewise from Middlesex. It is 54 miles in length from E. to W.; 48 broad from N. to S.; and 200 in circumference. Several towns of Essex, have been long distinguished for the manufacture of baize, which, however, is far from being so flourishing as formerly. The rivers, besides the boundary ones, are the Chelmer, Blackwater, Coln, Crouch, and Roding. Chelmsford is the capital.

Essex, a county of Massachusetts, 38 miles long, and 25 broad, bounded on the S. and E. by the Atlantic.

Essex, a county of New Jersey, 25 miles long and 16 broad; bounded on the E. by the Passaic and Newark Bay.

Essex, a county of Virginia, 55 miles long and 12 broad; bounded on the E. and N. E. by the Rappahannock; S. E. by Middlesex; S. and S. W. by King and Queen County; and N. W. by Caroline.

ESSOIN, in law, an excuse for a person summoned to appear and answer to an action, on account of sickness or other just cause of his absence. It is a kind of imparlance, or craving of longer time, and obtains in real, personal, and mixed actions. There are three essoins, as *de ultra mare*, when the defendant is beyond sea, whereby he is allowed forty days; in an expedition to the holy land, a year and a day; infirmity, called common essoin, when he is sick in bed; and, lastly, in the king's service.

ESSOIN-DAY, is regularly the first day of every term, though the fourth day after is also allowed by way of indulgence.

ESSOIN DE MALO VILLE, is where the defendant appears in court, but before pleading, falls sick in a certain village: this is also allowed, if found true.

ESSORANT, in heraldry, denotes a bird standing on the ground with its wings expanded, as if it had been wet, and were drying itself.

ESTABLISHMENT OF DOWER, in law, an assurance of dower made to the wife by the husband, or some friend of his, on marriage. See **DOWER**.

ESTAIN, a town of France, in the department of the Meuse, and late duchy of Bar; 10½ miles E. N. E. of Verdun.

ESTAMPES, or **ETAMPES**, a town of France, in the department of Seine and Oise, and late province of the isle of France, on the Juine, 15 miles E. of Chartres.

ESTAPA, or **ESTAPE**, a town of Mexico, in the province, and on the river Tabasco.

ESTAPLES, a town of France in the department of the Straits of Calais, 12 miles S. of Boulogne.

ESTAPO, a strong town of New Spain, at the mouth of the Taluc.

ESTATE, in law, signifies the interest that a person has in lands, tenements, or other effects; comprehending the whole in which a person has any property. Estates are either real or personal; otherwise distinguished into Freeholds, which descend to heirs; or Chattels, that go to executors or administrators. A fee simple is the amplest estate our law admits of. See **FEU**. Estates are obtained several ways; as, by descent from a father to a son; by conveyance or grant from one person to another; by gift or purchase; or by deed or will. See **DESCENT**, **SUCCESSION**, **TENURE**, &c.

ESTATES, in a political sense, is used either to denote the dominions of a prince, or the general classes into which the people

are divided. In Britain, the estates are the king, lords, and commons.

ESTE, a fertile district of Maritime Austria, in the Paduano.

ESTRE, the capital of the above district, anciently called *Ateste*.

ESTHER, [אֶסְתֵּר, Heb. *i. e.* secret, or hid,] a canonical book of the Old Testament, containing the history of

ESTHER, a Jewish virgin, whose great beauty raised her to the throne of Persia; whereby she saved her countrymen from the fatal extermination planned by proud Haman, prime minister and favorite of king Ahasuerus. The learned are not agreed who this Ahasuerus was. Archbishop Ussher supposes him to be Darius Hystaspes, and Artystona to be Esther. Scaliger makes him the same with Xerxes, and his queen Hamestris to be Esther. Josephus, on the contrary, positively asserts, that the Ahasuerus of the scriptures, is the Artaxerxes Longimanus of profane story; and the Septuagint, throughout the whole book of Esther, translate Ahasuerus by Artaxerxes. Most authors agree in this last opinion; and indeed the extraordinary kindness shewed by Artaxerxes to the Jews, can scarce be accounted for otherwise than by supposing that they had so powerful an advocate as Esther to solicit for them.

ESTOILE'E, or **CROSS ESTOILLE'E**, in heraldry, a star with only four long rays in form of a cross; and, accordingly, broad in the centre, and terminating in sharp points.

ESTOPPEL, in law, an impediment or bar to an action, which arises from a person's own fact; or rather where he is forbid by law to speak against his deed, which he may not do, even to plead the truth. Thus where a person is bound in a bond by such a name, and being afterwards sued by that name on the obligation, he shall not be allowed to say he is misnamed, but shall answer according to the bond, though it be wrong. Hence the parties in all deeds are estopped from saying any thing against them. However, a plaintiff is not estopped from saying any thing against what he had said in his writ or declaration; and though parties be estopped, yet juries are not so, who may find things out of the record.

ESTOVERS, in law, is used by Bracton, for that sustenance which a man committed for felony is to have out of his lands or goods for himself and family during imprisonment. In stat. 6, Edw. I. it is used for an allowance in meat or clothes. In some manors the tenants have common estovers; that is, necessary botes or allowances out of the lord's wood: in which last sense, estovers comprehend *house-bote*, *hay-bote*, and *plow-bote*; so that if a man have in his grant these general words, *de rationabili estoverio in boscis*, &c. he may thereby claim all three.

ESTOVERS is also used for alimony, which, if the husband refuses to pay, there is, besides the ordinary process of excommunication, a writ at common law, *de estoveriis habendis*, in order to recover it.

ESTRAMADURA. See **ESTREMADURA**.

ESTRAPE, [Fr.] the defence of a horse that will not obey, who, to get rid of his rider, rises mightily before; and while his fore-hand is yet in the air, yerks furiously with his hind-legs.

ESTRAVAYER, a town, fort, and district, of the Helvetic republic, in the canton of Friburg, 13 miles W. of Friburg.

ESTRAYS AND WAIFS, in law. Estrays are where any horses, sheep, hogs, beasts, or swans, or any beast that is not wild, come into a lordship, and are not owned by any man. Kitch. 23. The reason of estray is, because when no person can make title to the thing, the law gives it to the king, if the owner does not claim it within a year and a day. Waifs are goods which are stolen, and waved or left by the felon, on his being pursued, for fear of being apprehended, and forfeited to the king or lord of the manor: and though waifs are generally spoken of things stolen, yet if a man is pursued with hue and cry as a felon, and he flies and leaves his own goods, these will be forfeited as goods stolen; but they are properly the fugitive's goods, and not forfeited till it is found before the coroner, or otherwise of record, that he fled for the felony. 2 Haw. 450. Waifs and strays were anciently the property of the finders by the law of nature, and afterwards the property of the king by the law of nations. Dalt. Sher. 79. Waifs and strays not claimed within the year and day are the lord's. For where the lord has a beast a year and a day, and it has been cried in the church and markets, the property is changed. Kitch.

80. But it must be a year and a day from the time of proclamation, and not from the time of seizure; for it does not become an estray till after the first proclamation. 11 Mod. 89.

ESTREAT, is a true copy or note of some original writing on record, and especially of fines and amercement imposed in the rolls of a court, and extracted or drawn out thence, and certified into the court of exchequer: whereupon process is awarded to the sheriff to levy the same.

ESTREMADURA, a province of Portugal, near the mouth of the Tajo, bounded on the N. by Beira, on the E. and S. by Alentejo, and on the W. by the Atlantic. It is about 88 miles long, and 45 broad. This province is divided into six districts, called comarcas, viz. Litria, Lisbon, Tomar, Santarem, Alanquar, and Setubal, so named from the principal towns. It abounds in corn, and feeds numerous flocks of sheep. The fruits and the wines are all excellent; and it was here that the sweet oranges brought from China were first planted, and of which there are large quantities transported to foreign parts, with the wines and other fruits.

ESTREMADURA, a province of Spain, bounded by New Castile on the E. Leon on the N. Andalusia on the S. and Portugal on the W. It is said to be 175 miles long and 100 broad. Its principal towns are Calatrava, Menda, Badajoz, Alcantara, Cona, and Placentia. It has a very pure and healthful air, and its mountains are full of wild and tame animals. It abounds with corn and fruits; and the vineyards produce excellent wines of all colours.

ESTREMOS, or **ESTREMOZ**, a town of Portugal, in Alentejo, defended by a strong citadel on the top of a hill, surrounded by a large ditch, and 10 bastions. It is 15 miles W. of Badajoz.

ESTREPEMENT, or **ESTREPAMENT**, the spoil made by a tenant for life, upon any lands or woods, to the prejudice of the reversioner. Estrepement also signifies a writ which lies in two cases; the one is when the person having an action depending; (as a formedon, or dum fuit infra statem, or writ of right, or any other,) wherein the demandant is not to recover damages, sues to inhibit the tenant from making waste during the suit. The other is for the demandant that is adjudged to recover seisin of the land in question, and before execution sued by the writ habere facias seisinam, for fear of waste to be made before he can get possession: he then sues out this writ.

ESTUARY, [*estuarium*, Latin,] an arm of the sea; the mouth of a lake or river in which the tide reciprocates; a frith.

ESUS, the supreme god of the ancient Britons.

ESWECEN, a town of Germany, in Hesse-Cassel, 25 miles S. E. of Cassel.

ESZEK, a town of Slavonia, with a strong fort, 80 miles W. by N. of Belgrade, and 17 S. by E. of Vienna.

ETAIN, or **ESTAIN**. See **ESTAIN**.

ETANGS, a town of France, in the department of the Moselle, $7\frac{1}{2}$ miles E. N. E. of Mentz.

ETAYA, or **ETAYAH**, a town of Hindostan, in the province of Agra, 62 miles S. E. of Agra.

ETC, a contraction of the two Latin words *et cætera*, which signifies, and so on; and the rest; and others of the like kind.

To **ETCH**, [*etzen*, German,] a way used in making prints, by drawing with a proper needle upon a copper-plate, covered over with a ground of wax, &c. and well blacked with the smoke of a link, in order to take off the figure of the drawing or print; which, having its back side tintured with white lead, will, by running over the stricken out lines with a stift, impress the exact figure on the black or red ground; which figure is afterwards with needles drawn deeper quite through the ground, and all the shadows and hatchings put in; and then a wax border being made all round the plate, there is poured on a sufficient quantity of well tempered aqua fortis, which insinuating into the strokes made by the needles, usually eats, in about half an hour, into the figure of the print or drawing on the copper-plate. Harris.

ETCHING, a method of engraving on copper, in which the lines or strokes, instead of being cut with a tool or graver, are eaten in with aqua fortis. See **ENGRAVING**. Etching, though not very modern, is a later invention than engraving with the tool; of which it was at first only an imitation, practised by painters and

other artists, who could much sooner form their hands to, and attain a faculty of, working in this way, than with the graver. But being then considered as a counterfeit kind of engraving, and therefore inferior to the other, it was cultivated in a very confined manner; the closeness of the resemblance of the work to that performed by the tool, being made the test of its merit, and consequently the principal object or aim in those who pursued it. This servile confinement of the art of etching to the imitation of the original kind of engraving, retarded its advancement towards perfection, as many of the most able masters cramped their talents with the observance of it: which may be seen in the works of Sadelers, Swaneberg, Villamena, and particularly Le Bosse; who, in his treatise on engraving, has laid it down as a principle, that the perfection of etching consists in the close similitude of the work with that done by the tool. This absurd prepossession has since worn out: and etching has been so far improved, that instead of being now deemed a spurious kind of engraving, it is allowed to impart an excellence to many modern works, that could never have been produced without it: for though the neatness and uniformity of the hatches, made by the tool, are more advantageous with respect to portraits; yet the liberty and facility of etching give a much greater opportunity to exercise the force of genius and fancy in history engraving; where the effect of the whole, and not the minute exactness in finishing all the parts, constitutes the principal value. There are two methods of engraving in this way; the one with a hard varnish or ground, the other with a soft. The first was formerly much used, being better accommodated to the intention of imitating the engraving with the tool; as the firmness of the body of the varnish gave more opportunity of retouching the lines, or enlarging them with the oval-pointed needles, called by the French *echopes*, as was practised by Le Bosse and others for that purpose. The latter has now almost wholly superseded the use of the other, by the free manner of working it admits of; which affords a power of expression incompatible with the greater inflexibility of the hard varnish, that confines the lines and hatches to such a regularity and sameness, as gives a stiffness of manner and coldness of effect to the work. The mixture of the use of the tool and aqua fortis, which are now both employed in many cases, has, however, given that perfection to engraving which it possesses at present. The truth and spirit of the outline, that the method of working with aqua fortis affords, and the variety of shades which the different kinds of black produce in this way, as well as other means of expressing the peculiar appearance and character of particular subjects, furnish what was defective in the sole use of the tool; while, on the other hand, the exactness and regularity of the lines, which are required for finishing many kinds of designs, are supplied by the graver; and by a judicious application of both, that complete finishing is obtained, which either of them alone must necessarily want. The manner by which this art is performed, is the covering of the surface of the plate with a proper varnish, or ground, as it is called which is capable of resisting aqua fortis; and then scoring or scratching away, by instruments resembling needles, the parts of this ground, in the places where the strokes or hatches of the engraving are intended to be: the plate being then covered with aqua fortis, the parts that are laid naked by removing the varnish, are eaten away by it; while the rest, being secured and defended, remain untouched. The difference between the two methods above-mentioned consists as much in the difference of the varnish, as in that of the aqua fortis, adapted to each kind; but the general methods of performing them are alike in both. These varnishes are distinguished by the names of hard and soft: for in their consistence, or the resistance they give to the needles, lies their essential difference. The hard varnish was not the first in use, but soon took place of the other; and was, for some time, the most received in practice, on account of its allowing the work to be made more like that of the graver: the soft has, however, since, in its turn, prevailed to the exclusion of the hard in some degree, except in particular subjects; but not so entirely as to take away the expedience of shewing how it is performed. The manner of etching with the soft varnish is now, however, one of the most important objects of the art of engraving; and it is at present in universal use, sometimes alone, but more frequently intermixed with the work of the tool, and in some cases with great advantage, even where the whole is intended to pass for being performed by the graver. The hard, or Florence varnish

varnish is thus prepared: Take four ounces of fat oil very clear, and made of very good linseed oil, like that used by painters: heat it in a clean pot of glazed earthenware, and afterwards put to it four ounces of mastich well powdered: and stir the mixture briskly till the whole be well melted: then pass the whole mass through a piece of fine linen into a glass bottle with a long neck, that can be stopped very securely: and keep it for use. To making the soft varnish, Mr. Lawrence, an eminent English engraver at Paris, gives the following directions: "Take of virgin wax and asphaltum, each two ounces: of black pitch and Burgundy pitch, each half an ounce. Melt the wax and pitch in a new earthenware glazed pot; and add to them, by degrees, the asphaltum finely powdered. Let the whole boil, till such times as that, taking a drop upon a plate, it will break when it is cold, on bending it double two or three times, betwixt the fingers. The varnish being then enough boiled, must be taken off the fire; and letting it cool a little, must be poured into warm water, that it may work the more easily with the hands; so as to be formed into balls; which must be rolled up, and put into a piece of taffety for use." Care must be taken, 1st: that the fire be not too violent, for fear of burning the ingredients; a slight simmering will be sufficient: 2dly, that while the asphaltum is putting in, and even after it is mixed with them, the ingredients should be stirred continually with the spatula: and, 3dly, that the water, into which this composition is thrown, should be nearly of the same degree of warmth with it, to prevent a kind of cracking that happens when the water is too cold. The varnish ought always to be harder in summer than in winter; and it will become so if boiled longer, or if a greater proportion of the asphaltum or brown resin be used.

ETCHING, METHOD OF. 1. To apply the soft varnish: The plate being well polished, burnished, and cleansed from all greasiness by chalk or Spanish white, fix a hand-vice on the edge of the plate where no work is intended to be, to serve as a handle for managing it when warm: then put it upon a chafing-dish, in which there is a moderate fire; observing to hold it so that it may not burn: keep the plate over the fire till it be so hot that the varnish being brought into contact with it may melt: then cover the whole plate equally with a thin coat of the varnish; and while the plate is warm, and the varnish upon it in a fluid state, beat every part of the varnish gently with a small ball or dauber made of cotton tied up in taffety; which smooths and distributes the varnish equally over the plate. When the plate is thus uniformly and thinly covered with the varnish, it must be blackened by a piece of flambeau, or of a large candle which affords a copious smoke; sometimes two, or even four candles are used together for the sake of dispatch, that the varnish may not grow cold: which if it does during the operation, the plate must be heated again, that it may be in a melted state when that operation is performed: but great care must be taken not to burn it; which, when it happens, may be easily perceived by the varnish appearing burnt and losing its gloss. The following expedient is used, for the commodiously blackening the varnish, particularly where the plates are large: a strong hook is fixed in the roof of the room, through which passes four pieces of cord of equal length, at the end of which are fixed four iron rings of about four inches diameter, for supporting the corners of the plate. The plate being thus suspended in the air, with the varnished side downwards, may be blackened with great convenience: but this is not, however, absolutely requisite, except in the case of large plates that could not, without difficulty, be held up, unless this or some other such contrivance were made use of. The flambeau or candle must be kept at a due distance from the plate, lest the wick touch the varnish, which would sully and mark it. If the smoke has not penetrated the varnish, the plate must be again placed for some little time over the chafing-dish; and as the plate grows hot, the varnish will melt and incorporate with the black which lay above it, so that the whole will be equally pervaded by it. The greatest caution should be used to keep all the time a moderate fire; and to move frequently the plate, and change the place of all the parts of it, that the varnish may be alike melted every where, and kept from burning. Care must also be taken, that during this time, and even till the varnish be entirely cold, no filth, sparks, or dust, fly on it; for they would then stick fast, and spoil the work. 2. The method of applying the hard varnish is precisely the same as for the soft; being spread

equally over the warm plate with the taffety ball; and smoked in the same manner: only after it is smoked, it must be baked, or dried, over a gentle fire of charcoal, till the smoke from the varnish begins to decrease; taking care not to overheat the plate, which would both soften and burn the varnish. The plate being prepared, and an exact drawing of the outlines of the design made upon thin paper, the other side of the paper must be well rubbed with chalk or Spanish whitening, or, rather with red chalk scraped to a powder. The loose chalk is cleaned off with a linen rag: then the stained side of the paper is laid upon the varnish, fixing the corners to the plate with wax or wafers, to prevent its shuffling; and with a blunted needle or pointer the drawing is slightly traced, and communicates to the varnish an exact outline of the design to be etched. A variety of pointers is necessary for the work. Those used for the broad large strokes ought to be very blunt, exceedingly round, and well polished at the point; the sole of a shoe answers very well for polishing the points. The finest ought to be as sharp as a needle. If any scratches or false strokes happen in the working, they must be stopped up with a hair pencil dipped in Venetian varnish, mixed with lamp black, by which these places will be defended from the action of the aqua fortis. The next operation is that of eating or corroding the plate with aqua fortis. A border of soft wax (being a composition of bees'-wax melted with a little Venice turpentine and tallow) must be fastened round the plate about an inch high, in the form of a little wall, to contain the aqua fortis. At a corner of this border a gutter is made to pour the aqua fortis off the plate. Take a due quantity of the refiner's aqua fortis; mix it with half its quantity of common water; and pour it gently on, till it rise about a finger's breadth above the surface of the plate; when the aqua fortis will soon exert its action in the hatches which have been strongly touched; but those more weakly engraved will appear at first clear, and of the colour of the copper. The menstruum must therefore be suffered to continue on the plate till its effects become visible on the more tender parts: then the aqua fortis should be poured off, the plate washed with clean water, and dried before the fire: then take a small pencil dipped in the Venetian varnish, and cover with it the lighter parts of the plate. The aqua fortis must then be again poured on, and continued a longer or shorter time, according to the strength of the menstruum, or the nature of the engraving; when it must be again poured off, and the plate immediately washed with water. When the aqua fortis is on the plate, a feather should be used to cleanse away the foulness of the verdigris that gathers in the hatches, when the aqua fortis operates on them, and to give it more room to exert its action; for by moving the aqua fortis to and fro, on the plate by the feather, and brushing away the black saline matter where it appears to be formed, the hatches will be cleansed, and the aqua fortis exert its whole force equally on every part. The plate being thus sufficiently corroded by the aqua fortis, and well washed with water, it must be warmed at the fire, and the border of wax removed; after which, it must be made hotter till the varnish melt; then it must be well wiped with a linen cloth, and afterwards rubbed heartily with oil of olives; when it will be ready to be retouched and finished by the graver. See ENGRAVING.

ETCHING ON GLASS. Glass resists the action of all the acids, except the fluoric acid. By this, however, it is corroded in the same manner as copper is by aqua fortis; and plates of glass may be engraved in the same manner as copper. There are several methods of performing this. We shall first describe the mode of etching by means of the fluoric acid in the state of gas. Having covered over the glass to be etched with a thin coat of virgin-wax (which is only common bees'-wax bleached white,) draw the design upon it in the same manner as in etching on copper. Then take some fluor spar, commonly called Derbyshire spar, pound it fine, and put it into a leaden vessel, pouring some sulphuric acid over it. Place the glass with the etched side lowermost over this vessel, two or three inches above it. Apply a gentle heat to the leaden vessel; this will cause the acid to act upon the fluor spar, and disengage the gas, which will corrode the glass. When it is sufficiently corroded, remove the wax by oil of turpentine. This etching may be also performed by raising a margin of bordering-wax all round the glass, in the same manner as on copper, and pouring on the liquid fluoric acid, which acts upon the glass. The method of making this acid is described under fluoric acid.

A third

A third method of etching on glass is as follows: Having put the wax on the glass, draw your design, and raise a margin all round it. Then put pounded fluor spar, with some sulphuric acid diluted with water, upon the glass. The sulphuric acid will disengage the fluoric, which will be absorbed by the water, and corrode the glass.

ETEOCLES, in fabulous history, the eldest son of *Œdipus* and *Jocasta*. See *CŒRON*. Having reigned one year in Thebes, he refused to give up the crown to his brother, *Polynices*, according to their mutual agreement. *Polynices*, resolving to punish such a violation of a solemn engagement, implored the assistance of *Adrastus* king of *Argos*. He received that king's daughter in marriage, and was soon after assisted with a strong army headed by seven famous generals. *Eteocles* chose seven brave chiefs to oppose these, and stationed them at the seven gates of the city. He placed himself against his brother *Polynices*, and he opposed *Menalippus* to *Tydeus*, *Polyphontes* to *Capaneus*, *Megareus* to *Eteocles*, *Hyperbius* to *Parthenopæus*, and *Lasthenes* to *Amphiraus*. After much blood had been shed, it was at last agreed between the two brothers that the war should be decided by a single combat. Inflamed with the most inveterate fury on each side, they both fell; and it is said that their ashes separated on the funeral pile, as if still sensible of resentment, and hostile to reconciliation.

ETERNITY, is one of the attributes of God. See *LOGIC* and *METAPHYSICS*.

ETERNITY, in mythology, a divinity among the Romans, who had neither temples nor altars. They represented it under the figure of a woman, who held the sun in one hand and the moon in the other: her symbols were a phoenix, a globe, and an elephant.

ETESLÆ, or **ETESIAN WINDS**, are such as blow at stated times of the year, from what part soever of the compass they come. They are so called from the Greek word *ἔτος*, year, being anniversary winds, such as our seamen call monsoons and trade winds, which in some parts of the world continue constantly blowing for certain stated seasons of the year.

ETHER, [*æther*, Latin; *αἴηρ*,] in chemistry. See *ETHER* and *PHARMACY*.

ETHER, in physiology. See *ETHER*.

ETHICS, [from *ἠθικός*, manners, because the object thereof is to form the manners,] the science of manners or duty, which it traces from man's nature and condition, and shews to terminate in his happiness; or, in other words, it is the knowledge of our duty and felicity, or the art of being virtuous and happy. See *MORAL PHILOSOPHY*.

ETHIOPIA, a celebrated empire of Africa, whose boundaries have never been exactly defined either by ancient or modern geographers. Mr. Cruttwell divides it into Upper and Lower. Some writers of antiquity gave the title of Ethiopians to all nations whose complexion was black: Hence we find the Arabians as well as many other Asiatics sometimes falling under this denomination; besides a number of Africans whose country lay at a distance from Ethiopia Proper. Thus the Africans in general were by these writers divided into the western or Hesperian Ethiopians, and those above Egypt situated to the E. of the former; the latter being much more generally known than the former, by the commerce they carried on with the Egyptians. From this account we may easily understand, why there is such a seeming disagreement among ancient authors concerning the situation of the empire of Ethiopia, and likewise why it should pass under such a variety of names. Sometimes it was named India, and the inhabitants Indians; an appellation likewise applied to many other distant nations. Sometimes it was denominated *Atlantia* and *Etheria*, and in the most remote periods of antiquity *Cephenia*; but more usually *Abasene*, a word resembling its modern names, *Habash*, *Abassia*, or *Abyssinia*. On the other hand, we find *Persia*, *Chaldaea*, *Assyria*, &c. styled Ethiopia by some writers; and all the countries extending along the coast of the Red Sea were promiscuously denominated India and Ethiopia. By the Jews the empire of Ethiopia was styled *Cush* and *Ludim*. Notwithstanding this diversity of appellations, and vast diffusion of territory ascribed to the Ethiopians, there was one country to which the title was thought more properly to belong than to any of the rest; and which was therefore called *Ethiopia Propria*. This was bounded

on the N. by Egypt, extending all the way to the lesser cataract of the Nile, and an island named *Elephantine*; on the W. it had *Libya interior*; on the E. the Red Sea, and on the S. unknown parts of Africa; though these boundaries cannot be fixed with any precision. In this country the ancients distinguished a great variety of different nations, to whom they gave names either from some personal property, or from their manner of living. The principal of these were, 1. The *Blemmyes*, seated near the borders of Egypt; and who, probably from the shortness of their necks, were said to have no heads, but eyes, mouths, &c. in their breasts. Their form, somehow or other, must have been very extraordinary, as we learn from *Vopiscus*, who gives an account of some of the captives of this nation brought to Rome. 2. The *Nobatae*, inhabiting the banks of the Nile near the island *Elephantine*, said to have been removed thither by *Oasis* to repress the incursions of the *Blemmyes*. 3. The *Troglodytes*, by some writers said to belong to Egypt, and described as little superior to brutes. 4. The *Nubians* inhabiting *Nubia*. 5. The *Pignies*, by some supposed to be a tribe of *Troglodytes*; but by the most approved writers placed on the African coast of the Red Sea. 6. The *Aualitæ* or *Abalitæ*, of whom we know nothing more than that they were situated near the *Abalitic* gulf. 7. The *Struthiophagi*, so called from their feeding upon ostriches, were situated to the S. of the *Memnonæ*. 8. The *Acridophagi*; 9. *Chelonophagi*; 10. *Ichthyophagi*; 11. *Cynamolgi*; 12. *Elephantophagi*; 13. *Rhizophagi*; 14. *Spermatophagi*; 15. *Hylophagi*; and, 16. *Ophiophagi*: all of whom had their names from the food they made use of, viz. locusts, tortoises, fish, bitches milk, elephants, roots, fruits or seeds, shrubs, and serpents. 17. The *Hylogones*, near to the *Elephantophagi*, and who were so savage that they had no houses, nor any other places to sleep in but the tops of trees. 18. The *Pamphugi*, who used almost every thing indiscriminately for food. 19. The *Agriophagi*, who lived on the flesh of wild beasts. 20. The *Anthropophagi*, or man-eaters, are now supposed to have been the *Caffres*, and not any inhabitants of Proper Ethiopia. 21. The *Hippophagi*, or horse-eaters, who lay on the N. of *Libya Incognita*. 22. The *Macrobi*, a powerful nation, remarkable for their longevity; many of them attaining the age of 120 years. 23. The *Sambri*, situated near the city of *Tenupsis* in *Nubia* upon the Nile; of whom it is reported that all the quadrupeds they had, not excepting even the elephants, were destitute of ears. 24. The *Asacha*, a people inhabiting the mountainous parts, and continually employed in hunting elephants. Besides these, there were a number of other nations or tribes, of whom we scarce know any thing but the names; as the *Gapachi*, *Ptoemphanes*, *Catadupi*, *Pechini*, *Catadræ*, &c. The most famous cities and towns of ancient Ethiopia were *Abalis*, *Axum*, *Caloe*, *Melis*, *Mondus*, *Mosylon*, *Napata*, *Opone*, and *Premis* or *Premnis*. The climate of Ethiopia varies, according to the situation and elevation of the ground. On the coast of the Red Sea, as well as the open flat parts of the country in general, the heat is so intense, that at *Suakem*, an island in the Red Sea, *Gregory*, the *Abyssine*, relates that it was so great, as to excoriate any part of the body exposed to the solar rays, melt hard sealing-wax, and sear a garment like red hot iron. In several districts, however, the heat is milder than in Portugal, and in *Samen* the air is rather cold than otherwise. In some other provinces the winter is very severe, though snow is seldom seen. Hail indeed sometimes falls, and Mr. Bruce mentions snow having once fallen which lasted three days, and was looked upon as a prodigy. There are frequent and violent thunders, with excessive deluges of rain during part of the year, and violent storms of wind. The missionaries mention a kind of wind named *Sendo*, which, according to *Gregory*, may be seen like a serpent of vast magnitude with its head on the ground, and the body twisted in vast curls up to the skies. This, in all probability, is that violent species of whirlwind, named *Typhon*, frequent in Egypt, America, and other warm countries: and its being visible is owing to the dust which it takes up in its passage. In a country inhabited by such a variety of nations, as we have above enumerated, all in a state of extreme barbarism, it is rather to be wondered that we have any history at all, than that it is not more distinct. It is generally agreed that *Cush* was the great progenitor of the inhabitants, and hence the country has been named from him. Many authors are of opinion, that Ethiopia received its first inhabitants from the country lying E. of the Red Sea; and that the descendants

of Cush, having settled in Arabia, gradually migrated to the S. E. extremity of that country; whence, by an easy passage across the straits of Babelmandel, they transported themselves to the African side, and entered the country properly called Ethiopia: a migration which, according to Eusebius, took place during the residence of the Israelites in Egypt; but, in the opinion of Syncellus, after they had taken possession of Canaan, and were governed by judges. Mr. Bruce mentions a tradition among the Abyssinians, which, they say, has existed among them from time immemorial, that very soon after the flood, Cush the grandson of Noah, with his family, passed through Atbara, then without inhabitants, till they came to the ridge of mountains, which separates that country from the high lands of Abyssinia. Here, still terrified with the thoughts of the deluge, and apprehensive of a return of the same calamity, they chose to dwell in caves made in the sides of these mountains rather than trust themselves in the plains of Atbara; and our author is of opinion, that the tropical rains, which they could not fail to meet with in their journey southward, and which would appear like the return of the deluge, might induce them to take up their habitations in these high places. Be this as it may, he says, it is an undoubted fact, "that here the Cushites, with unparalleled industry, and with instruments utterly unknown to us, formed to themselves commodious, yet wonderful, habitations in the heart of mountains of granite and marble, which remain entire in great numbers to this day, and promise to do so till the consummation of all things." The Cushites having once established themselves among these mountains, continued to form similar habitations in all the neighbouring ones: and thus following the different chains, spread the arts and sciences, which they cultivated, across the African continent from the eastern to the western ocean. According to the tradition abovementioned, they built the city of Axum, early in the days of Abraham. This city was anciently noted for its superb structures, of which some remains are still visible. The Cushites extended themselves along the mountains which run parallel to the Red Sea on the African side; which country, according to Mr. Bruce, has "in all times been called Saba, or Azabo, both of which signify South;" an epithet given it from its lying S. of the Arabian gulf, and which in ancient times was one of the richest and most important countries in the world. "By that acquisition (says Mr. Bruce,) they enjoyed all the perfumes and aromatics in the east; myrrh, and frankincense, and cassia; all which grow spontaneously in that stripe of ground from the Bay of Bilur W. of Azab to Cape Gardefan, and then southward up in the Indian ocean, to near the coast of Melinda, where there is cinnamon, but of an inferior kind." As the Cushites advanced still farther S. they met not only with mountains, in which they might excavate proper habitations, but likewise with great quantities of gold and silver furnished by the mines of Sofala, which, our author says, furnished "large quantities of both metals in their pure and unmixed state, lying in globules without alloy or any necessity of preparation or separation." In other parts of this work he proves Sofala to have been the Ophir of scripture. See OPHIR. Thus the Ethiopians, for some time after their settlement, according to Mr. Bruce, must have been a nation of the first importance in the world. The northern colonies from Meroe to Thebes built cities, and made improvements in architecture; cultivated commerce, agriculture, and the arts; not forgetting the science of astronomy, for which they had an excellent opportunity by the clearness of the sky in the Thebaid. According to some ancient authors, the Ethiopians were conquered by Moses; of which transaction they give the following account. Before the time of that legislator, the Ethiopians possessed the country of Thebais in Egypt: but, not content with this, they made an irruption into the Lower Egypt, and penetrated as far as Memphis; where, having defeated the Egyptians, they threatened the kingdom with total destruction. The Egyptians, by the advice of their oracles, put Moses at the head of their forces; who immediately prepared for invading the enemy's country. The Ethiopians imagined that he would march along the banks of the Nile; but Moses chose rather to pass through some of the interior countries, though greatly infested with serpents, and where consequently his march must have been attended with much danger. To preserve his men, he constructed a number of panniers of the Egyptian reed papyrus, which he filled with the birds named Ibis, celebrated for their antipathy to serpents. As soon as he approached the tract abounding with these reptiles, a sufficient num-

ber of the birds were let out, who presently cleared the way for the army by destroying the serpents. Thus the Ethiopians were surprised in their own country where they had dreaded no invasion; their forces, being defeated in the field, were at last shut up in the capital Meroe, a city almost impregnable, by being surrounded with three rivers, the Nile, Astapus, and Astaboras. The daughter of the Ethiopian monarch, however, having an opportunity of seeing Moses from the walls, fell in love with him, and offered to deliver up the city, provided he would swear to marry her. With this requisition the Jewish legislator complied; but treated the inhabitants with great severity; plundering the city, and putting many of the people to death. After this he ravaged the whole country, dismantling all the places of strength; and having thus rendered the Ethiopians incapable of attempting any kind of offensive operations against other nations for a considerable time, he returned in triumph to Egypt, after an absence of 10 years. From the time of Moses to that of Solomon there is a chasm in the Ethiopic history. After this, however, we are furnished with some kind of regular accounts. The history commences with the reign of the queen of Sheba, who came to visit the Jewish monarch, and whom the Abyssinians suppose to have been sovereign of Ethiopia Proper: but Mr. Bruce is of opinion that she was only sovereign of that territory on the E. coast of Africa named Saba, which he says ought to be her title, instead of Sheba. In favour of this opinion he likewise urges, that it was customary for the Sabaeans, who inhabited Saba, to be governed by women; whereas those who inhabited the opposite side of the Arabian gulf, and who were named Sabean Arabs, or Homerites, were not only governed by kings, but would not allow their sovereigns to go abroad any where, under pain of being stoned to death. The Abyssinians, however, claim her for their sovereign; and he informs us, that having received an account from Tamerin, an Ethiopian merchant, of the surprising wisdom and wealth of Solomon, she undertook the journey mentioned in Scripture, to ascertain the truth of the report. In this she was attended by many of her nobility, carrying along with her also magnificent presents for the monarch she intended to visit. According to the Abyssinian historians, she was a pagan at the time this journey was undertaken; but being struck with admiration at the sight of Solomon's grandeur, and the wisdom he displayed, she became a convert to the true religion.

ETHIOPIA, LOWER, according to the reverend Mr. Crutwell, in his New Universal Gazetteer, comprehends all the kingdoms south of the equinoctial line; as Congo, Lower Guinea, Caffraria, Monomotapa, &c.

ETHIOPIA, MODERN, or THE UPPER, or HIGHER ETHIOPIA, or, as it is now called, **ABYSSINIA**, is divided, according to Mr. Bruce, into two parts, named Tigre and Amhara; though this rather denotes a difference in the language than the territory of the people. It is subdivided into twelve provinces.

ETHIOPIA, MODERN, BOUNDARIES OF. From the map which Mr. Bruce has given of Abyssinia, in his fifth volume, it appears that this empire is bounded on the south by a vast chain of mountains, extending with very little interruption from 34° to 44° Lon. E. and between 8° and 9° Lat. N. In more prosperous times it extended beyond these S. into the kingdom of Adel; but the mountains are undoubtedly to be reckoned its natural boundaries on this side. On the E. and N.E. it has the Red Sea, and on the S.E. the kingdom of Adel. On the W. and N. its boundaries are less distinctly marked; having on both these quarters the barbarous kingdom of Sennaar, whose limits frequently vary according to the fortune of war betwixt the two monarchs. From Arkeeko, situated near the foot of the Basalt mountains, in about 15° 30' Lat. N. it extends near 7° Lat. N. where the mountains of Caffa, the most southerly province of Abyssinia terminate. Along the coast of the Red Sea lie the territories inhabited by the Hazorta Shiho, the district of Engana Shiho, and the kingdom of Dancali, including the territory of Azab and the salt-pits. To the west of these is the kingdom of Tigre, including the country of the Dobas, part of the kingdom of Bali, and that of Dawaro. Still farther west are those of Sire, Lasta, Amhara, the greatest part of Bali, and part of Fatigar, which last reaches beyond the mountains. Proceeding still in the same direction, we come to Tcherkin, Tchelga, Abargale, Salao, Begemder, Xoa, and Ifat; reckoning always from north to south; Tcherkin, for instance, being north of Tchelga, &c. Xoa extends

a considerable way to the west, so that, besides Ifat, it has to the south of it also the kingdoms of Hade and Cambut; the latter extending beyond the south ridge of mountains. To the west are Ras de Feel, Dembea, Gojam, and Damot; and beyond these are the kingdoms of Dembea, Bizamo, Gooderoo, and Guraque; those of Nare, or Enarea, and Caffa, occupying the south-west corner of the empire. Ancient authors agree, that Ethiopia was very mountainous; but they mentioned no mountains of any magnitude, except Garbato and Elephas, whose situation is not now easily ascertained, though it is thought they answer to the mountains of Tigre. The Jesuits were the first who gave any information to the Europeans concerning this country. The provinces of Begemder, Gojam, Walaka, Xoa, &c. are one continued chain of mountains. Many of them are said to be of such enormous height, that the Alps and Pyrenees are but mole-hills in comparison. Those called Aorni were said to be of this kind; but Mr. Bruce informs us, that these accounts are exaggerated. Amongst those mountains, and often in the plains, there are many steep and craggy rocks of various and whimsical shapes; some of them so smooth, that men and oxen are craned up to the top by engines: but what is most surprising, the tops of these rocks are covered with woods and meadows, full of springs and streams of water; of the truth of which we have an attestation by Mr. Bruce, in his description of Lamalmon. The names of the twelve provinces of Abyssinia are, Masuah, Tigre, Samen, Begemder, Amhara, Walake, Gojam, Damot, Maisha, Dembea, Kuara, and Narea. See these articles in their order. Abyssinia abounds with a vast variety of quadrupeds both wild and tame. Immense numbers of cattle every where appear, some of them the most beautiful in the world. Some have monstrous horns, said to be capable of holding ten quarts each; but this, says Mr. Bruce, is a disease which proves fatal to them. Buffalos are numerous, fierce, and untractable; but there are no carnivorous bulls, which have been said to exist in this and other parts of Africa. Antelopes are met with in great numbers in the uncultivated parts; feeding chiefly on the leaves of trees. Hyenas, lions, foxes, jackals, &c. are also found, as well as elephants, camelopards, and other more uncommon kinds. Great havoc is made in the cultivated fields by baboons, apes, rats, and mice. There is plenty of hares; but these being reckoned unclean, as well as wild boars, are not used as food. The rivers abound with crocodiles and hippopotami, at least the Nile, and those large streams which flow into it: but many others have water in them only during the rainy season, and thus have neither fish, nor any animal that feeds upon them. The number of birds in this country is immense. Great numbers of eagles, vultures, hawks, and other carnivorous birds, come punctually every year after the tropical rains. They feed at first upon the shell-fish, which are found in great quantities on the edges of the deserts, where they had lived in the salt springs; but, being forced from their natural habitations when these springs swell by the rains, are afterwards left to perish on dry land. When these fail, they feed on the carcasses of the large animals, such as the elephant and rhinoceros, which are killed in the flat countries by the hunters. Their next supply is the multitudes of rats and field mice which infest the country after harvest. The vast slaughter of cattle made by the Abyssinian armies, the multitude of persons killed, whose bodies are allowed to rot on the field of battle, &c. furnish them also with other resources. There are other birds which feed upon insects, and multitudes which live on grain and seeds of various kinds, which are amply supplied by the immense quantity of fruits and berries which grow in Abyssinia, and are ripe at all seasons of the year. Among the reptiles in Abyssinia, Mr. Bruce describes a kind of lizard, and the cerastes, or horned serpent; but denies that serpents are numerous in Abyssinia, as almost all authors have supposed. He describes very few fishes; though he says that an account of these, and other marine productions of the Red Sea, which he has painted and collected, would occupy many large volumes, and the engraving would cost a sum which he could not by any means afford. He mentions one named binny, which is good food, and grows to a pretty large size; that from which he took the drawing being about 32 pounds weight. Its whole body is covered with beautiful scales resembling silver spangles. Of the insect tribe the most extraordinary is the tsaltalya, or zimb, a kind of venomous fly, extremely destructive to cattle. Mr. Bruce also mentions a small species of ants, whose bite is more painful than the sting of a scorpion, and which issue

out of the ground in such numbers, as to cut in pieces carpets and every thing made of soft materials that they have access to. The three largest rivers in Ethiopia are the Nile, the Tacazze, and the Zebbee; but there are many others of inferior size, such as the Bachilo, Geshen, Gult, Mai-Lami, Samba, Temci, &c. The great variety of climates in Ethiopia, is very perceptible in its soil and productions. The mountains in many places are not only barren, but altogether inaccessible, except by those who make it their constant practice to climb amongst them; and even by them they cannot be ascended without great difficulty and danger. In the vallies, however, and flat parts of the country, the soil is excessively fruitful, though in the warmest places grain cannot be brought to perfection. Wine is also made in some places; but the greatest profusion of fruits of all kinds is to be met with every where, as well as many plants not to be found in other countries. There is a vast variety of flowers which adorn the banks of the rivers, in such a manner as to resemble fine gardens. Among these there is a species of roses, which grow upon trees, and are much superior in fragrance to those which grow on bushes. Sena, cardamon, ginger, and cotton, are likewise produced in great quantities. All the trees of Abyssinia are ever-greens; and their leaves are of a thick leathery consistence, and highly varnished, to enable them to resist the violent periodical rains. A very remarkable particular concerning the fruit-trees is, that those which bear fruit all the year round do not carry it always in the same place. The W. side is that which blossoms first, and where, of consequence, the fruit first comes to perfection; the south side succeeds, and goes through the same process; after which, the north blossoms in like manner; and last of all the east side, which produces flowers and fruit towards the beginning of the rainy season. A variety of rare plants are met with in Abyssinia, the chief of which Mr. Bruce particularly describes. The ancient Ethiopians, who inhabited the country above Meroë made remarkable distinctions among their gods. Some, they said, were of an eternal and incorruptible nature, as the sun, the moon, and the universe; others, having been born among men, had acquired divine honours by their virtue, and by the good which they had done to mankind. They worshipped Isis, Pan, and particularly Jupiter and Hercules, from whom they supposed they had received most benefits. But some Ethiopians believed that there were no gods; and when the sun rose, they fled into their marshes, execrating him as their most cruel enemy. Circumcision was a rite observed among the ancient Ethiopians, as well as the Egyptians, from very early antiquity; and some suppose that the former received it from the latter, and both from the Israelites; though others insist, that the Ethiopians first adopted it from the children of Abraham by Keturah. The religion of the modern Ethiopians is a mixture of Paganism, Judaism, Christianity, and Mohammedanism. Christianity, however, being the established religion, is the one most generally professed. The frontier countries of Nara, Rasel-Feel, Tchelga, &c. are wholly inhabited by Mohammedans.

ETHMOIDES OS. See **ANATOMY**. The name of this bone is derived from *εθμος*, a sieve, and *ειδος*, form, because it is porous like a sieve.

ETHNARCH, or ETHNARCHA, [*εθνος*, a nation, and *αρχος*, a ruler,] a governor of a nation. There are some medals of Herod the Great, on one side whereof is *Ἡρωδου*, and on the other *Εθναρχου*, i. e. Herod the Ethnarch. This title has been used synonymously with Tetrarch, though originally different.

ETHNOPHRONES, [from *εθνος*, a heathen, and *φρονειν*, to think,] in antiquity, a sect of heretics in the seventh century, who made a profession of Christianity, but joined thereto many of the ceremonies and follies of paganism; as judicial astrology, sortileges, and other divinations.

ETHOLOGY, [*εθος*, manner, and *λογος*, discourse,] a representation of the manners and customs of a people.

ETHOPOIA, [from *εθος*, manner, and *ποιειν*, to do,] a figure in rhetoric, in which the manners of a people are represented.

ETHULIA, in botany, a genus of the polygamia aequalis order, and syngenesia class of plants; natural order Compositæ. Receptacle naked; down none. It has six species.

ETIENNE, St. or ST. ESTIENNE, a town of France, in the department of Rhone and Loire, 22 miles S. E. of Fuers, and 260 S. by E. of Paris.

ETIQUETTE, [Fr. *i. e.* a ticket, or title, affixed to a bundle of papers, expressing its contents,] is used when applied to the Spanish

Spanish and some other courts, to signify a particular account of what is to be done daily in the king's household, and in the chief ceremonies relating to it. The word is now chiefly used to denote those forms that regulate the decorum of conduct towards persons of various ranks and stations: a sense very different from its original meaning.

ETNA, or **ÆTNA**, a famous burning mountain in Sicily, and the largest in Europe. See **ÆTNA**.

ETOILE, in fortification, a small fort, or redoubt, in the form of a star.

ETOLIA, or **ÆTOLIA**, a country of ancient Greece, comprehending all that tract now called the *Despotat*, or little Greece. It was separated on the east by the River *Evanus*, now the *Fidari* from the *Locrenses Ozolæ*: on the west from *Acarnania*, by the *Achelous*; on the north from the country of the *Dorians* and part of *Epirus*; and, on the south it extended to the bay of *Corinth*.

ETOLIANS, the ancient inhabitants of *Etolia*; who are said to have been a restless and turbulent people; seldom at peace among themselves, and ever at war with their neighbours. This is not improbable; but they are also represented as utter strangers to all sense of friendship and principles of honour; ready to betray their friends upon the least prospect of reaping any advantage from their treachery; in short, they were looked upon by the other states of Greece as outlaws and public robbers.

ETON, or **EATON**, a town of Bucks, 20 miles W. of London. See **EATON**.

ETRURIA, or **HETRURIA**, in ancient geography, a celebrated country of Italy, on the Tiber, bounded by that river, the *Macra*, the *Apennine*, and the *Tyrrhene Sea*. The greater part of it is now included in the duchy of *Tuscany*.

ETTINGEN, **ETTLINGEN**, or **ÆTTINGEN**, a town of Germany in the circle of *Suabia*, and margraviate of *Baden*.

ETYMOLOGY, [from *τυμη*, true, and *λογια*, discourse,] that part of grammar which considers and explains the origin and derivation of words, in order to arrive at their primary signification. It is styled by Cicero *notatio ad veriloquium*; though Quintilian chooses rather to call it *originatio*. A judicious inquiry into etymologies is thought by some of considerable use; because nations who value themselves upon their antiquity, have always looked on the antiquity of their language as one of the best titles they could plead; and the etymologist, by seeking the true and original reason of the notions and ideas fixed to each word and expression, may often furnish an argument from the traces remaining thereof, compared with the ancient uses. But a more profitable use is, that etymologies are necessary for the thorough understanding of a language. For, to explain a term precisely, there is often a necessity for recurring to its first origin, in order to speak justly and satisfactorily thereof. The force and extent of a word is generally better conceived when a person knows its origin and etymology. It is objected, however, that the art is arbitrary, and built altogether upon conjectures and appearances; and etymologists are charged with deriving their words from whence they please. Indeed, it is no easy matter to go back into the ancient British and Gaulish ages, and to follow, as it were, by the track, the various imperceptible alterations a language has undergone from age to age; and as those alterations have sometimes been merely owing to caprice, it is easy to take a mere conjecture for a regular analogy: so that it is no wonder many should be prejudiced against a science which seems to stand on so precarious a footing. It must be owned that etymologies are often so far fetched, that one can scarce see any resemblance or correspondence therein.

EU, a sea-port of France, in the department of the Lower Seine, and late province of Normandy, 15 miles N. E. of Dieppe, and 36 of Rouen.

EVACUATION, in animal economy, is the act of diminishing, attenuating, or discharging, the humours. The due evacuations of the body, and its proper nourishment, are equally necessary; and it is an object of considerable importance, that nothing remain in the constitution which should be discharged; and that whatever is conducive to its preservation, may not be uselessly wasted. If the evacuations be disordered, the most rigid adherence to dietetic rules will not contribute to the continuance or restoration of health; these rules, however, may often be dispensed with, provided the evacuations be regular.

EVANDER, in fabulous history, a famous Arcadian chief, said to have been the son of Mercury, on account of his eloquence, by the prophetess *Carmenta*. He brought a colony of his people into Italy, about sixty years before the taking of Troy; when *Faunus*, who then reigned over the Aborigines, gave him a large territory, in which he settled with his friends.

EVANGELIST, is derived from the Greek, *εωαγγελιστο*, formed of *eu*, good, and *αγγελος*, angel or messenger. This title was given in the primitive church to such as preached the gospel in different places, without being attached to any particular church. In this sense some interpreters think that Philip, one of the seven deacons, is called the evangelist, in Acts xxi. 8. St. Paul writing to Timothy, 2 Eph. iv. 5, bids him do the work of an evangelist; and in his epistle to the Ephesians, iv. 11, he ranks the evangelists after the apostles and prophets.

EVANID COLOURS are such as are of short duration, as those in the rainbow, in clouds before and after sun-set, &c. They are also called fantastical and emphatical colours.

EVANSHAM, a town of Virginia, and capital of Wythe county, 40 miles W. by S. of Christiansburg, and 518 S. W. by W. of Philadelphia.

EVANTES, in antiquity, the priestesses of Bacchus, so called, because in celebrating the orgia, they ran about as if distracted, crying *evan! evan! ohè evan!*

EVAPORATION, in chemistry, the setting of a liquor in a gentle heat or in the air, to discharge its superfluous humidity, reduce it to a proper consistence, or obtain its dry remainder. Evaporation, though generally considered as the effect of the heat and motion of the air, may be produced by a different cause. Fluids lose more by evaporation in the severest frost than when the air is moderately warm. Thus, in the great frost of 1708, it was found that the greater the cold the more considerable the evaporation. Ice itself loses much by evaporation.

EVAPORATION, in natural philosophy, is the conversion of water into vapour, which in consequence of becoming lighter than the atmosphere, is raised considerably above the surface of the earth, and afterwards by a partial condensation forms clouds. It differs from exhalation, which is properly a dispersion of dry particles from a body. We are indebted to the experiments of Saussure and Deluc, for much of our knowledge of the qualities of vapour. It is an elastic invisible fluid like common air, but lighter; being to common air of the same elasticity, according to Saussure, as 10 to 14, or according to Kirwan, as 10 to 12. When water is heated to 212°, it boils, and is rapidly converted into steam; and the same change takes place in much lower temperatures; but in that case the evaporation is slower, and the elasticity of the steam is smaller. As a very considerable proportion of the earth's surface is covered with water, and as this water is constantly evaporating and mixing with the atmosphere in the state of vapour, a precise determination of the rate of evaporation must be of very great importance in meteorology. Accordingly, many experiments have been made to determine the point by different philosophers. No person has succeeded so completely as Mr. Dalton: but many curious particulars had been previously ascertained by the labours of Richman, Lambert, Wallerius, Leidenfrost, Watson, Saussure, Deluc, Kirwan, and others.

1. The evaporation is confined entirely to the surface of the water: hence it is in all cases proportional to the surface of the water exposed to the atmosphere. Much more vapour, of course, rises in maritime countries, or those interspersed with lakes, than in inland countries.

2. Much more vapour rises during hot weather than during cold: hence the quantity evaporated depends in some measure upon temperature. The precise law has been happily discovered by Mr. Dalton. This philosopher took a cylindrical vessel of tin, whose diameter was 3½ inches, and its depth 2½ inches, filled it with water, and kept it just boiling for some time. The loss of weight in a minute was 30 grains, when the experiment was made in a close room without any draught of air; 35 grains when the vessel was placed over the fire in the usual fire-place, there being a moderate draught of air, and the room close; 40 with a brisker fire and a stronger draught; and when the draught was very strong, he supposes the evaporation might amount to 60 grains in the minute. At the temperature of 180°, the quantity evaporated was one half of what was lost at 212°.

At 164° it was $\frac{1}{3}$ of that at 212°

152	$\frac{1}{3}$
144	$\frac{1}{3}$
138	$\frac{1}{3}$

And in general the quantity evaporated from a given surface of water per minute at any temperature is to the quantity evaporated from the same surface of 212°, as the force of vapour at the first temperature is to the force of vapour at 212°. Hence, in order to discover the quantity which will be lost by evaporation, from water of a given temperature, we have only to ascertain the force of vapour at that temperature. Hence we see that the presence of atmospheric air obstructs the evaporation of water; but this evaporation is overcome in proportion to the force of the vapour. Mr. Dalton ascribes this obstruction to the vis inertia of air.

3. The quantity of vapour which rises from water, even when the temperature is the same, varies according to circumstances. It is least of all in calm weather, greater when a breeze blows, and greatest of all with a strong wind. The following table drawn up by Mr. Dalton, shews the quantity of vapour raised from a circular surface of six inches in diameter in atmospheric temperatures. The first column expresses the temperature; the second the corresponding force of vapour; the other three columns give the number of grains of water that would be evaporated from a surface of six inches in diameter in the respective temperatures, on the supposition of there being previously no aqueous vapour in the atmosphere. These columns present the extremes and the mean of evaporation likely to be noticed, or nearly such; for the first is calculated upon the supposition of 35 grains loss per minute from the vessel of 3½ inches in diameter; the second 45, and the third 55, grains per minute.

Temperature, 212°	Force of vapour in inches. 30	Evaporating force in grains.

4. Such is the quantity of vapour which would arise in different circumstances, on the supposition that no vapour existed in the atmosphere. But this is a supposition which can never be admitted, as the atmosphere is in no case totally free from vapour. Now when we wish to ascertain the rate at which evaporation is going on, we have only to find the force of the vapour already in the atmosphere, and subtract it from the force of vapour at the given temperature: the remainder gives us the actual force of evaporation; from which, by the table, we readily find the rate of evaporation. Thus, suppose we wish to know the rate of evaporation at the temperature 59°. From the table we see that the force of vapour at 59° is 0.5 or $\frac{1}{2}$ its force at 212°. Suppose we find by trials that the force of the vapour already existing in the atmosphere is 0.25, or the half of $\frac{1}{2}$. To ascertain the rate of evaporation, we must subtract the 0.25 from 0.5; the remainder 0.25 gives us the force of evaporation required; which is precisely one-half of what it would be if no vapour had previously existed in the atmosphere. By the table we see that on that supposition a surface of six inches diameter would lose one grain by evaporation per minute, instead of two grains, which would have been converted into vapour if no vapour had previously existed in the atmosphere. If the force of the vapour in the atmosphere had amounted to 0.5, which is equal to the force of vapour at the temperature of 59°, in that case no vapour whatever would rise from the water; and if the force of the vapour already in the atmosphere exceeded 0.5, instead of evaporation, moisture would be deposited on the surface of the water. These general observations, for all of which we are indebted to Mr. Dalton, account in a satisfactory manner for all the anomalies which had puzzled preceding philosophers; and include under them all the less general laws which they had discovered. We must consider the discoveries of Mr. Dalton as the most important additions made to the science of meteorology for these many years.

5. As the force of the vapour actually in the atmosphere is seldom equal to the force of vapour of the temperature of the atmosphere, evaporation, with a few exceptions, may be considered as constantly going on.

Various attempts have been made to ascertain the quantity evaporated in the course of a year; but the difficulty of the problem is so great, that we can expect only an approximation towards a solution. From the experiments of Dr. Dobson of Liverpool in the years 1772, 1773, 1774, and 1775, it appears that the mean annual

annual evaporation from the surface of the water amounted to 36.78 inches. The proportion for every month was the following:

Inches.	Inches.
January.....1.50	July.....5.11
February.....1.77	August.....5.01
March.....2.64	September.....3.18
April.....3.30	October.....2.51
May.....4.34	November.....1.51
June.....4.41	December.....1.49

Mr. Dalton found the evaporation from the surface of the water in one of the driest and hottest days of summer rather more than 0.2 of an inch. If we believe Mr. Williams, the evaporation from the surface of land covered with trees and other vegetables is one-third greater than from the surface of water; but this has not been confirmed by other philosophers. From his experiments it appears, that in Bradford in New England the evaporation, during 1772, amounted to 42.65 inches. But from the way that his experiments were conducted, the amount was probably too great. From an experiment of Dr. Watson, made on the 2d of June 1779, after a month's drought, it appears, that the evaporation from a square inch of a grass plot amounted to 1.2 grains in an hour, or 28.8 grains in 24 hours, which is 0.061 of an inch. In another experiment, after there had been no rain for a week, the heat of the earth being 110°, the evaporation was found almost twice as great, or = 0.108 of an inch in the day. The mean of these two experiments is 0.084 inches, amounting for the whole of June to 2.62 inches. If we suppose this to bear the same proportion to the whole year that the evaporation in Dr. Dobson's experiments for June do to the annual evaporation, we shall obtain an annual evaporation, amounting to about 22 inches. This is much smaller than that obtained by Mr. Williams. But Dr. Watson's method was not susceptible of precision. He collected the vapour raised on the inside of a drinking-glass; but it was impossible that the glass could condense much more than one-half of what did rise, or would have been raised in other circumstances. But then the experiments were made in the hottest part of the day, when much more vapour is raised than during any other part of it. The most exact set of experiments on the evaporation from the earth was made by Mr. Dalton and Mr. Hoyle, during 1796, and the two succeeding years. The method which they adopted was this: Having got a cylindrical vessel of tinned iron, ten inches in diameter, and three feet deep, there were inserted into it two pipes turned downwards for the water to run off into bottles: the one pipe was near the bottom of the vessel, the other was an inch from the top. The vessel was filled up for a few inches with gravel and sand, and all the rest with good fresh soil. It was then put into a hole in the ground, and the space around filled up with earth, except on one side, for the convenience of putting bottles to the two pipes; then some water was poured on to sadden the earth, and as much of it as would be suffered to run through without notice, by which the earth might be considered as saturated with water. For some weeks the soil was kept above the level of the upper pipe, but latterly it was constantly a little below it, which precluded any water running off through it. For the first year the soil at top was bare; but for the two last years it was covered with grass the same as any green field. Things being thus circumstanced, a regular register was kept of the quantity of rain-water that ran off from the surface of the earth through the upper pipe (whilst that took place,) and also of the quantity of that which sunk down through the three feet of earth, and ran out through the lower pipe. A rain-gauge of the same diameter was kept close by to find the quantity of rain for any corresponding time. The weight of the water which ran through the pipes being subtracted from the water in the rain-gauge, the remainder was considered as the weight of the water evaporated from the earth in the vessel. The following table exhibits the mean annual result of these experiments:

Water through the two pipes.			Mean.	Mean	Mean
Inch.	Inch.	Inch.	Inch.	Rain.	Evap.
1796.	1797.	1798.			
January 1.897—	.680—	1.774+	1.450+	2.458	1.008
February 1.778—	.918—	1.122	1.273	1.801	.528
March .431—	.070—	.335	.279	.902	.623
April .220—	.295—	.180	.232	1.717	1.485
May 2.027—	2.443+	.010	1.493+	4.177	2.684
June .171—	.726	—	.299	2.483	2.184
July .153—	.025	—	.059	4.154	4.095
August —	.304	—	.168	3.554	3.386
September —	.976	—	.325	3.279	2.954
October —	.680	—	.227	2.899	2.672
November —	1.044	1.594	.879	2.934	2.055
December .200	3.077	1.878+	1.718+	3.202	1.484
6.877—	10.934—	7.379	8.402	33.560	25.158
Rain 30.629—	38.791—	31.259			
Evapor. 23.725—	27.857—	23.862			

From these experiments it appears, that the quantity of vapour raised annually at Manchester is about 25 inches. If to this we add five inches for the dew with Mr. Dalton, it will make the annual evaporation 30 inches. Now, if we consider the situation of England, and the greater quantity of vapour raised from water, it will not surely be considered as too great an allowance if we estimate the mean annual evaporation over the whole surface of the globe at 35 inches. But 35 inches from every square inch on the superficies of the globe make 94,450 cubic miles; equal to the water annually evaporated over the whole globe. Was this prodigious mass of water all to subsist in the atmosphere at once, it would increase its mass by about a twelfth, and raise the barometer nearly three inches. But this never happens; no day passes without rain in some part of the earth, so that part of the evaporated water is constantly precipitated again. Indeed it would be impossible for the whole of the evaporated water to subsist in the atmosphere at once, at least in the state of vapour.

EVASION, in law, any subtle endeavour to set aside truth, or to escape the punishment of the law. Thus, if a person says to another that he will not strike him, but will give him a pot of ale to strike him first, and accordingly he strikes, the returning of it is punishable; and if the person first striking be killed, it is murder: for no man shall evade the justice of the law by such a pretence to cover his malice.

EVATES, a branch of the Druids. Strabo divides the British and Gaulish philosophers into three sects; bards, evates, and druids. He adds, that the bards were the poets and musicians; the evates, the priests and naturalists; and the druids, moralists as well as naturalists: but Marcellus and Hornius reduce them all to two sects, viz. the Bards and Druids.

EVAUX, a town of France, in the department of Creuse, 18 miles N. N. E. of Aubusson.

EUBAGES, or **EUBATES**, an order of priests or philosophers among the ancient Celts or Gauls: some suppose them to be the same with the druids and saronide of Diodorus; and others, that they were the same with what Strabo calls Evates.

EUBŒA, or **ABANTIUS**, in ancient geography, an oblong island, stretching out between Attica and Thessaly. It is now called Negropont, from its principal town, anciently called Chalcis.

EUCALYPTUS, a genus of the hexandria monogynia class and order. Calyx superior, permanent, truncate before flowering, covered with an hemispherical deciduous lid; corolla none; capsule four-celled, opening at top, inclosing many seeds. There are two species, lofty trees of New Holland; called also the red-gum tree, from a gummy matter, in which one of them, the resinifera, abounds.

EUCHARIST properly signifies giving thanks; the word *Eucharistia* literally importing thanksgiving; being formed of *e*, good; and *charis*, thanks. This sacrament was instituted by Christ himself, and the participation of it is called communion. As to the manner of celebrating the eucharist among the primitive Christians, after the customary oblations were made, the deacon brought water

to the bishops and presbyters, standing round the table, to wash their hands. Then the deacon cried out aloud, "Mutually embrace and kiss each other;" which being done, the whole congregation prayed for the universal peace and welfare of the church, for the tranquillity and repose of the world, for the prosperity of the age, for wholesome weather, and for all ranks and degrees of men. After this followed mutual salutations of the minister and people; and then the bishop or presbyter having sanctified the elements by a solemn benediction, he brake the bread, and delivered it to the deacon, who distributed it to communicants, and after that the cup. Their sacramental wine was usually diluted or mixed with water. During the administration, they sang hymns and psalms; and having concluded with prayer and thanksgiving, the people saluted each other with a kiss of peace.

EUCHITE, or EUCHITES, [Ευχῆται, Gr. from εὐχῆ, prayer,] a sect of ancient heretics, who were first formed into a religious body towards the end of the 4th century, though their chief doctrines and discipline subsisted in Syria, Egypt, and other eastern countries, before the birth of Christ. They were thus called because they prayed without ceasing, agreeably to the words of St. Paul, 1 Thess. v. 17, imagining that prayer alone was sufficient to save them.

EUCHITES, another sect of fanatics, who, in the 12th century, infested the Greek and Eastern churches, and who were charged with believing a double Trinity, rejecting wedlock, abstaining from flesh, treating with contempt the sacraments of baptism and the Lord's supper, and the various branches of external worship, and placing the essence of religion solely in external prayer, and maintaining the efficacy of perpetual supplications to the supreme Being for expelling an evil genius, who dwelt in the breast of every mortal.

EUCHOLOGIUM, [Ευχολογιόν, Gr. i. e. a discourse on prayer; from εὐχῆ, prayer, and λόγος, discourse,] the Greek ritual, wherein are prescribed the order and manner of every thing relating to the administration of their ceremonies, sacraments, ordinations, &c.

EUCLEA, a genus of the diœcia dodecandria class and order. In both male and female the calyx is four or five-toothed; corolla four or five-parted; male stamina, twelve to fifteen. In the female, the germ is superior; styles two; berry two-celled. One species, a branching tree of the Cape.

EUCLID OF ALEXANDRIA, the celebrated mathematician, flourished in the reign of Ptolemy Lagus, about B. C. 280. He reduced all the fundamental principles of pure mathematics, which had been delivered down by Thales, Pythagoras, Endoxus, and other mathematicians before him, into regularity and order, and added many others of his own discovering; on which account he is said to be the first who reduced arithmetic and geometry into the form of a science. He likewise applied himself to the study of mixed mathematics, and especially to astronomy and optics, in which he also excelled. His works, as we learn from Pappus and Proclus, are the Elements of Geometry, Data, Introduction to Harmony, Phenomena, Optics, Catoptrics, a Treatise of the Division of Superficies, Loci ad Superficiem, Porisms, Fallacies, and four books of Conics. Of these the most celebrated is his Elements, of which there have been numberless editions in all languages. A fine edition of all his works now extant was printed in 1703, by David Gregory, Savilian professor of astronomy at Oxford. Euclid was greatly esteemed by king Ptolemy; who once asking him, if there was any shorter way of coming at Geometry than by his Elements, Euclid answered, that "there was no royal path to Geometry."

EUCLID OF MEGARA, a celebrated philosopher and logician, flourished about B. C. 400. The Athenians having prohibited the Megarians from entering their city on pain of death, this philosopher disguised himself in women's clothes to attend the lectures of Socrates. After the death of Socrates, Plato and other philosophers went to Euclid at Megara, to shelter themselves from the tyrants who governed Athens. Euclid admitted but one chief good; which he sometimes called God, sometimes Spirit, and sometimes Providence.

EUCOMIS, a genus of the class and order hexandria monogynia. Calyx inferior, six-parted, permanent, spreading; filaments united at the base into a nectary growing to the corolla. There are four species, plants of the Cape.

EUDIOMETER, an instrument for ascertaining the purity of

the atmospherical air, or the quantity of oxygenous gas contained in it, chiefly by means of its diminution on a mixture with nitrous acid, or some similar substance. After the composition of the atmosphere was known to philosophers, it was taken for granted that the proportion of its oxygen varied in different times and in different places; and that upon this variation the purity or noxious qualities of air depended. Hence it became an object of the greatest importance to be in possession of a method of determining readily the quantity of oxygen in a given portion of air. Accordingly, various methods were proposed, all of them depending upon the property which bodies possess of absorbing the oxygen of the air without acting upon its azote. These bodies were mixed with a certain known quantity of atmospherical air, in graduated glass vessels inverted over water, and the proportion of oxygen was determined by the diminution of bulk. These instruments received the name of eudiometers, because they were considered as measures of the purity of air; from ἡ εὐδία, serenity of the atmosphere, and μέτρον, a measure. The eudiometers proposed by different chemists may be reduced to five. 1. The first eudiometer was made in consequence of Dr. Priestley's discovery, that when nitrous gas is mixed with air over water, the bulk of the mixture diminishes rapidly, in consequence of the combination of the gas with the oxygen of the air, and the absorption of the nitric acid thus formed by the water. When nitrous gas is mixed with azotic gas, no diminution at all takes place. When it is mixed with oxygen gas in proper proportions, the absorption is complete. Hence it is evident, that in all cases of a mixture of these two gases, the diminution will be proportional to the quantity of the oxygen. Of course it will indicate the proportion of oxygen in air; and by mixing it with different portions of air, it will indicate the different quantities of oxygen which they contain, provided the component parts of air are susceptible of variation. Dr. Priestley's method was, to mix together equal bulks of air and nitrous gas in a low jar, and then to transfer the mixture into a narrow graduated glass tube about three feet long, in order to measure the diminution of bulk. He expressed this diminution by the number of hundredths parts remaining. Thus, suppose he had mixed together equal parts of nitrous gas and air, the sum total of this mixture was 200 (or 2.00): suppose the residuum when measured in the graduated tube to amount to 104 or (1.04), and of course that 96 parts of the whole had disappeared, he denoted the purity of the air thus tried by 104. A more convenient instrument was invented by Dr. Falconer of Bath; and Fontana greatly improved this method of measuring the purity of air. A description of his eudiometer was published by Ingenhouz, in the first volume of his Experiments: it was still farther improved by Mr. Cavendish in 1783; and Humboldt has lately made a very laborious set of experiments in order to bring it to a state of complete accuracy. But after all the exertions of these philosophers, the method of analysing air by means of nitrous gas is liable to so many anomalies, that it cannot be depended on. Priestley and Fontana have proved, that the way of mixing the two airs occasions a great difference in the result, the figure of the vessels is equally important, and so is the water over which the mixture is made. And even when all these things are the same, the impurity of the nitrous gas may occasion the most enormous differences in the results. Humboldt has shewn that the nitrous gas ought to be prepared by means of nitric acid of the density 1.170; when a much stronger or weaker acid is employed, the gas produced is always contaminated with a great proportion of azotic gas. He has pointed out the solution of sulphate of iron as proper to ascertain the purity of the nitrous gas employed, by absorbing the nitrous gas, and leaving the azotic gas or other foreign gases. He has shewn that when nitrous gas of the same degree of purity is made to mix very slowly with air, the vessel being carefully agitated during the mixture, the results, provided the experiment is performed with address, correspond with each other. And he has made it probable, that when equal quantities of air and nitrous gas, so pure as to contain only about 0.1 of azotic gas mixed with it, are agitated together slowly over water, the diminution divided by 3.55, gives the quantity of oxygen contained in the air examined. But notwithstanding the ingenuity of his experiments, the anomalies attending this method are still so great as not to render it susceptible of accuracy. For that reason it is unnecessary to give a particular description of the different eudiometers invented to ascertain the purity of air by means

means of nitrous gas. The result of the numerous experiment which have been made with nitrous gas is, that the proportion of oxygen in atmospheric air varies in different places and at different times. The minimum is about 0.22, the maximum about 0.30; consequently if this method of analysing air is to be depended on, we must consider that fluid not as a permanent chemical compound, but as a body subjected to all the variations to which accidental mixtures are liable.

2. The second kind of eudiometer was proposed by Volta. The substance employed by that philosopher to separate the oxygen from the air was hydrogen gas. His method was, to mix given proportions of the air to be examined and hydrogen gas in a graduated glass tube; to fire the mixture by an electric spark; and to judge of the purity of the air by the bulk of the residuum. But this method is not susceptible of even so great a degree of accuracy as the preceding, when the object is to ascertain the precise quantity of oxygen gas in a given bulk of air. For if too little hydrogen gas is mixed with the air, not only the whole of the oxygen will not be abstracted, but a portion of the azote will disappear in consequence of the formation of nitric acid. On the other hand, if too much hydrogen is added, part of it will remain after the firing of the mixture, and increase the bulk of the residuum. Volta's eudiometer, then, though it may have its uses, is scarcely susceptible of giving us the analysis of air.

3. For the third kind of eudiometer, we are indebted to Scheele. It is merely a graduated glass vessel, containing a given quantity of air exposed to newly prepared liquid alkaline or earthy sulphurets; or to a mixture of iron-filings and sulphur, formed into a paste by means of water. These substances absorb the whole of the oxygen or vital principle of the air, which converts a portion of the sulphur into an acid. The oxygen contained in the air thus examined, is judged of by the diminution of bulk which the air has undergone. This method is not only exceedingly simple, but it requires very little address, and yet is susceptible of as great accuracy as any other whatever. The only objection to which it is liable is its slowness; for when the quantity of air operated on is considerable, several days elapse before the diminution has reached its maximum. But this objection has been completely obviated by M. De Marti, who has brought Scheele's eudiometer to a state of perfection. He found that a mixture of iron-filings and sulphur does not answer well, because it emits a small quantity of hydrogen gas, involved by the action of the sulphuric acid formed by the absorption of the oxygen of the air upon the iron; but the hydrogenated sulphurets, formed by boiling together sulphur and liquid potash or lime-water, answered the purpose perfectly. These substances, indeed, when newly prepared, have the property of absorbing a small portion of azotic gas; but they lose this property when saturated with that gas, which is easily effected by agitating them for a few minutes with a small portion of atmospheric air. His apparatus is merely a glass tube, ten inches long, and rather less than half an inch in diameter, open at one end, and hermetically sealed at the other. The close end is divided into 100 equal parts, having an interval of one line between each division. The use of this tube is to measure the portion of air to be employed in the experiment. The tube is filled with water; and by allowing the water to run out gradually while the tube is inverted, and the open end kept shut with the finger, the graduated part is exactly filled with air. These hundredth parts of air are introduced into a glass bottle filled with liquid sulphuret of lime previously saturated with azotic gas, and capable of holding from two to four times the bulk of the air introduced. The bottle is then to be corked with a ground glass stopper, and agitated for five minutes. After this the cork is to be withdrawn while the mouth of the phial is under water; and for the greater security, it may be corked and agitated again. After this, the air is to be again transferred to the graduated glass tube, in order to ascertain the diminution of its bulk. Air examined by this process, suffers precisely the same diminution in whatever circumstances the experiments are made: no variation is observed whether the wind is high or low, or from what quarter soever it blows; whether the air tried is moist or dry, hot or cold; whether the barometer is high or low. Neither the season of the year, nor the situation of the place, its vicinity to the sea, to marshes, or to mountains, makes difference. M. De Marti found the diminution always between 0.21 and 0.23. Hence we may conclude that air is composed of

0.78 azotic gas.
0.22 oxygen gas.

1.00

Scheele indeed found, that the absorption amounted to 0.27; but that was because he neglected to saturate his sulphuret with azotic gas: for when the portion of azotic gas, which must have been absorbed, and which has been indicated by de Marti, is subtracted, the portion of oxygen in air, and indicated by his experiments, is reduced very nearly to 0.22. The trifling variations perceptible in his experiments were no doubt owing to the quantities of the mixture of sulphur and iron, by which he abstracted the oxygen, not being exactly the same at different times; the consequence of which would be, an unequal absorption of azotic gas.

4. In the fourth kind of eudiometer, the abstraction of the oxygen of air is accomplished by means of phosphorus. This eudiometer was first proposed by Acharde. It was considerably improved by Reboul, and by Seguin and Lavoisier; but Berthollet has lately brought it to a state of perfection, as it is equally simple with the eudiometer of De Marti, and scarcely inferior to it in precision. Instead of the rapid combustion of phosphorus, this last philosopher has substituted its spontaneous combustion, which absorbs the oxygen of air completely; and when the quantity of air operated on is small, the process is over in a short time. The whole apparatus consists in a narrow graduated tube of glass containing the air to be examined, into which is introduced a cylinder of phosphorus fixed upon a glass rod, while the tube stands inverted over water. The phosphorus should be so long as to traverse nearly the whole of the air. Immediately white vapours rise from the phosphorus and fill the tube. These continue till the whole of the oxygen combines with phosphorus. They consist of phosphorous acid, which falls by its weight to the bottom of the vessel, and is absorbed by the water. The residuum is merely the azotic gas of the air, holding a portion of phosphorus in solution. Berthollet has ascertained, that by this foreign body its bulk is increased one-fortieth part. Consequently, the bulk of the residuum, diminished by $\frac{1}{40}$, gives us the bulk of the azotic gas of the air examined; which bulk, subtracted from the original mass of air, gives us the proportion of oxygen gas contained in it. All the different experiments which have been made by means of this eudiometer, agree precisely in their result, and indicate that the proportions of the ingredients of air are always the same, namely, about 0.22 part of oxygen gas, and 0.78 of azotic gas. Berthollet found these proportions in Egypt and in France, and Dr. Thomson found them constantly in Edinburgh in all the different seasons of the year. Thus we see that the analysis of air by means of phosphorus, agrees precisely with its analysis by means of hydrogenated sulphurets.

5. The fifth eudiometer has been lately proposed by Mr. Davy. In it the substance used to absorb the oxygen from air is a solution of sulphate or muriate of iron in water, and impregnated with nitrous gas. A small graduated glass tube, filled with the air to be examined, is plunged into the nitrous solution, and moved a little backwards and forwards. The whole of the oxygen is absorbed in a few minutes. The state of greatest absorption ought to be marked, as the mixture afterwards emits a little gas which would alter the result. By means of this and the two preceding eudiometers, Mr. Davy examined the air at Bristol, and found it always to contain about 0.21 of oxygen. Air sent to Dr. Beddoes from the coast of Guinea gave exactly the same result. This eudiometer, then, corresponds exactly with the two last. In all these different methods of analysing air, it is necessary to operate on air of a determinate density, and to take care that the residuum is neither more condensed nor dilated than the air was when first operated on. If these things are not attended to, no dependence whatever can be placed upon the result of the experiments, how carefully soever they may have been performed. Now there are three things which alter the volume of air and other elastic fluids: 1. A change in the height of the barometer. 2. An increase or diminution of their quantity; the vessel in which they are contained remaining the same, and standing in the same quantity of water or mercury. 3. A change in the temperature of the air.

EUDOCIA, or EUDOSIA, a celebrated lady, the daughter of Leontius, a philosopher of Athens; who gave her such a learned education, that at his death, he left her only a small legacy, the

saying she was capable of making her own fortune. Pleading at Athens against her two brothers, for a share in her father's estate, without success, she carried her cause personally by appeal to Constantinople; recommended herself to Pulcheria, the sister of the emperor Theodosius II. embraced Christianity, was baptized by the name of Eudisia, (her original name being Athenais,) and soon after married to the emperor. Their union lasted a considerable time: but a difference at last taking place, on account of the emperor's jealousy, excited by Chrysapius the eunuch, she retired to Jerusalem, where she spent many years in building and adorning churches and in relieving the poor. Dupin says that she did not return thence till after the emperor's death: but Cave tells us, that she was reconciled to him, returned to Constantinople, and continued with him till his death; after which she went again to Palestine, where she spent the remainder of her life in pious works. She died A. D. 459, or 460. Cave says that on her death-bed she took a solemn oath, by which she declared herself entirely free from any stain or unchastity. She wrote a paraphrase on the first eight books of the Old Testament in heroic verse; another in prose on Daniel and Zacharias; a history of St. Cyprian and Justina, and a Life of Christ, in heroics, with many other poems, which are lost.

EUDOXIANS, a sect of heretics in the 4th century, who adhered to the errors of the Arians and Eunomians, maintaining that the Son was created out of nothing; that he had a will different from that of the Father, &c.

EUDOXIUS, the founder of the sect of the Eudoxians, was patriarch of Antioch and Constantinople, and succeeded Macedonius in the latter see, A. D. 360. He was a zealous defender of the Arian doctrine; and died A. D. 370.

EUDOXUS, a celebrated astronomer of Cnidus, in Caria, who flourished about B. C. 370. He studied geometry under Archytas, and travelled into Egypt to learn the other sciences. There he and Plato studied together for thirteen years, after which they came to Athens; where Eudoxus taught with so much renown, that even Plato is said to have envied him. Eudoxus composed "Elements of Geometry," from which, Proclus tells us, Euclid himself borrowed liberally. Cicero calls Eudoxus the greatest astronomer that ever lived, and Petronius says, he spent the latter part of his life on the top of a high mountain, that he might contemplate the stars with more convenience. Strabo says, the remains of his observatory were to be seen at Cnidus in his time. He died in his 53d year.

EVE, [הוה, Heb. *i. e.* she lived,] the mother of all mankind. See **ADAM**.

EVELYN, JOHN, a most learned writer and natural philosopher, born at Wotton in Surrey, the seat of his father, in 1620. After making the tour of Europe, he returned about 1651, and lived very retired at his rural retreat, Say's Court, near Deptford in Kent. He was very assiduous in transmitting to the Royal Society whatever fell within the compass of his inquiries; and used humbly to style himself pioneer in the service. When the number of books he published is considered, the many he left behind him unfinished and unpublished, and the variety of subjects on which he employed his time, his industry and application appear astonishing. "His life," says Mr. Walpole, "was a course of inquiry, study, curiosity, instruction, and benevolence. The works of the Creator, and the mimic labours of the creature were all objects of his pursuit. He unfolded the perfections of the one, and assisted the imperfections of the other. He adored from examination; was a courtier that flattered only by informing his prince, and pointing out what was worthy of him to countenance; and was really the neighbour of the Gospel, for there was no man that might not have been the better for him. He was one of the first promoters of the Royal Society, a patron of the ingenious and indigent, and peculiarly serviceable to the lettered world; for, besides his writings and discoveries, he obtained the Arundelian marbles for the university of Oxford, and the Arundelian library for the Royal Society: nor is it the least part of his praise, that he who proposed to Mr. Boyle the erection of a philosophical college for retired and speculative persons, had the honesty to write in defence of active life, against Sir George Mackenzie's "Essay on Solitude." He knew that retirement in his own hands was industry and benefit to mankind; but in those of others, laziness and idleness." There are five small prints of his journey from Rome

to Naples, drawn and etched by him; and among his published works are, 1. A Character of England; 2. The State of France; 3. An Essay on the first book of Lucretius De Rerum Natura; 4. The French Gardener; 5. A Panegyric on King Charles II.'s Coronation; 6. Famifugum, or the Inconveniences of the Air and Smoke of London dissipated; 7. The History and Art of Engraving on Copper; 8. A Parallel between the Ancient Architecture and Modern; 9. Sylva, or a Discourse of Forest Trees; and several others. This amiable gentleman died, full of age and honour, in 1706.

EVEN NUMBERS. See **NUMBER**.

EVENLY EVEN NUMBERS, or EVENLY ODD NUMBERS. See **NUMBER**.

EVER-GREEN, in gardening, a species of perennials, which continue their verdure, leaves, &c. all the year: such are hollies, phillyria's laurustinuses, bays, pines, firs, cedars of Lebanon, &c.

EVERLASTING PEA. See **LATHYRUS**.

EVERSHOT, a town of Dorsetshire, 12 miles N. W. of Dorchester.

EVESDROPPERS, in law, persons who stand under the eaves, walls, or windows, of a house, by day or by night, to listen after news, and carry it to others, thereby raising strife and contention in the neighbourhood. They are punishable in the court-leet, or quarter-sessions.

EVESHAM, a township of New Jersey, in Burlington county, between the forks of Moore's Creek; 16 miles E. of Philadelphia.

EVESHAM, or EVESHOLM, commonly called **ESAM**, a borough of Worcestershire, seated on a gentle ascent from the river Avon. It is 14 miles S. E. of Worcester, and 95 N. W. by W. of London.

EUGENIA, the **YAMBOO**; a genus of the monogynia order, and icosandria class of plants; natural order, Hesperideæ. Calyx quadripartite, superior; petals four; fruit a monospermous quadrangular plum. There are eleven species, natives of the East or West Indies.

EVIAN, a town of France, in the department of Mont Blanc, on the S. side of the lake of Geneva, 23 miles N. E. of Geneva.

EVICTIO, in law, signifies a recovery of lands, or tenements. When lands, &c. are evicted before rent reserved upon a lease becomes due, the lessee is not liable to pay any rent. Likewise, if on an exchange of lands, either of the parties is evicted of the land given in exchange, the party evicted may, in that case, re-enter his own lands. And a widow being evicted of her thirds, shall be endowed in the other lands of the heir.

EVIDENCE, in law, signifies proof by testimony of men upon oath, or by writings or records. It is called evidence, because thereby the point in issue, in a cause to be tried, is to be made evident. The system of evidence, as now established in our courts of common law, is very full, comprehensive, and refined; far different from, and superior to, any thing known in the middle ages;—as far superior in that as in all other improvements and refinements in science, arts, and manners. As to evidence, the common law requires no certain number of witnesses, though in some cases the statute-law does. The testimony of one single evidence is sufficient for the crown in all causes, except treason or conspiracy against the state, where there must be two: sometimes violent presumption will be admitted as evidence, without witnesses, as where a person is run through the body in a house, and one is seen to come out of that house with a bloody sword. In general, a party interested in a suit, a wife for or against her husband, unless in cases of treason, an alien infidel, persons non sane memoria, such as are convicted of felony, perjury, &c. may not be evidence in the cause; but kinsmen, though ever so near, also tenants, servants, masters, attorneys for their clients, one of the jurors upon trial, and all others that are not infamous, and who want not understanding, or are no parties in interest, may be allowed to give evidence; though the credit of servants is left to the jury: also the judge going off the bench may give evidence. Witnesses are summoned by writ of subpoena to attend on penalty of 100l. to the king, and 10l. to the party, with charges by statute 5 Eliz. c. 9. All witnesses of all religions, who believe in a future state of rewards and punishments are received, but not persons infamous in law by their crimes, nor persons directly interested in the matter in issue; and

no counsel or attorney shall be compelled to disclose the secrets intrusted to him by his client, but he may give evidence of facts which he knew by other means than for the purpose of the cause. The oath of the witness is to speak the truth, the whole truth, and nothing but the truth, and all evidence is to be given in open court. The law never gives credit to the bare assertion of any one, however high his rank or pure his morals; but requires (except in particular cases with respect to quakers) the sanction of an oath, and the personal attendance of the party in court, that he may be examined and cross-examined by the different parties; and therefore in cases depending on parole or verbal evidence, the testimony of persons who are themselves conversant with the facts they relate, must be produced; the law paying no regard, except under special circumstances, to any hearsay evidence. Thus in some cases, the memorandum in writing made at the time, by a person since deceased, in the ordinary way of his business, and which is corroborated by other circumstances, will be admitted as evidence of the fact. The general rules of evidence are, 1. The best evidence must be given that the nature of the thing is capable of. 2. No person interested in the question can be a witness; but to this there are exceptions, as first, in criminal prosecutions; secondly, for general usage, for convenience of trade, as a servant to prove the delivery of goods, though it tends to clear himself of neglect. 3. Where the witness acquires the interest by his own act, after the party who calls him has a right to his evidence. The third rule is, that hearsay of a matter of fact is no evidence; but of matter of reputation, such as a custom, it is in some sort evidence. 4. Where a general character is the matter in issue, particular facts may be received in evidence, but not where it occurs incidentally. 5. In every issue the affirmative is to be proved. 6. No evidence need be given of what is agreed, or not denied upon the pleadings. In cases of crimes, as of robbery on the highway, in an action against the hundred, and rapes of women, &c. a man or woman may be an evidence in their own cause; so likewise in private notorious cheats, where none else can be witness of the circumstances of the fact, but he that suffers. And in general the same rules prevail as those above stated, but evidence of the confessions of the party should be received with caution, and are rejected when obtained through promises or threats. Presumptive evidence should be admitted with caution, and two excellent rules are given by Sir Matthew Hale, that no one should be convicted of stealing goods of a person actually unknown, unless there is proof of a felony actually committed; and none tried for murder, until the murdered body be found. When a witness is not liable to any legal objection, he is first examined by the counsel for the party on whose behalf he comes to give evidence, as to his knowledge of the fact he is to prove. This examination, in cases of any intricacy, is a duty of no small importance in the counsel: for as on the one hand, the law will not allow him to put what are called leading questions, viz. to form them in such a way as would instruct the witness in the answers he is to give; so on the other, he should be careful that he makes himself sufficiently understood by the witness, who may otherwise omit some material circumstance of the case. The party examined must depose those facts only of which he has an immediate knowledge and recollection; he may refresh his memory with a copy taken by himself from a day-book; and if he can then speak positively as to his recollection, it is sufficient; but if he has no recollection further than finding the entry in his book, the book itself must be produced. Where the defendant had signed acknowledgements of having received money, in a day-book of the plaintiff, and the plaintiff's clerk afterwards read over the items to him, and he acknowledged them all right, it was held, that the witness might refresh his memory by referring to the books, although there was no stop to the items on which the receipt was written, for this was only proving a verbal acknowledgement, and not a written receipt. Written evidence has been divided into two classes: the one, that which is public, the other private; and this first, has been subdivided into matters of record, and others of an inferior nature. The memorials of the legislature, such as acts of parliament, and other proceedings of the two houses, were acting in a legislative character; and judgement of the King's superior courts of justice, are denominated records, and are so respected by the law, that no evidence whatsoever can be received in contradiction of them; but these are not permitted to be removed from place to place to serve a private purpose, and are therefore proved by copies of them,

which in the absence of the original, is the next best evidence. A bill in chancery has been admitted as slight evidence against the complainant; and an answer, is evidence against the defendant in equity himself, though not against others, and the whole may be read by the adverse party. Depositions in chancery, may be evidence at law, but not against others, and regularly not if the witness be alive, except when taken in perpetuum rei memoriam, &c. Matter in law ought not to be given in evidence upon a trial, but only of fact. On the question, how far persons who have been defrauded of securities, or injured by a perjury or other crime, can be witnesses in prosecuting for those offences, the event of which might possibly exonerate them from an obligation they are charged to have entered into, or restore to them money which they have been obliged to pay; the general principle now established is this: the question in a criminal prosecution or personal act, being the same with that in a civil cause in which the witnesses are interested, goes generally to the credit, unless the judgement in the prosecution where they are witnesses, can be given in evidence in this cause wherein they are interested. But though this is the general rule, an exception to it seems to be established in the case of forgery; for many cases have been decided, that a person whose hand-writing has been forged to an instrument, whereby if good he would be charged with a sum of money, or one who has paid money in consequence of such forgery, cannot be a witness on the indictment. In cases where the party injured cannot by possibility derive any benefit from the verdict in the prosecution, as in indictments for assault, and the like personal injury, his competence has never been doubted. It is a general rule that a party cannot be examined as a witness, for he is in the highest degree interested in the event of it; but where a man is not in point of fact interested, but only a nominal party, as where members of a charitable institution are defendants in their corporate character, there is no objection to an individual member being examined as a witness for the corporation; for in this case he is giving evidence for the public body only, and not for himself as an individual. Peake's N. P. Cas. 153. But N. P. 293.

EVIL, in philosophy, &c. is either moral or natural. Moral evil is the disagreement between the actions of a moral agent, and the rule of those actions whatever it is. See MORAL PHILOSOPHY. Natural evil is, whatever destroys, or any way disturbs, the perfection of natural beings: such as blindness, diseases, death, &c.

EVIL-MERODACH, king of Babylon, succeeded his father Nebuchadnezzar the Great, A. M. 3443. He had governed the kingdom during the lunacy of his father, who after seven years, having recovered his understanding, once more ascended the throne, and imprisoned his son Evil-Merodach. In this confinement, it is supposed, that Evil-Merodach made an acquaintance and friendship with Jeconiah, king of Judah, who had been carried to Babylon by Nebuchadnezzar. However, it is certain, that soon after his succession to the throne, he delivered the king of Judah out of prison, after a confinement of 37 years, heaped many favours on him, and placed him above all the other kings who were at the court of Babylon. (2 Kings xxv. 27. Jer. lii. 31.) Evil-Merodach reigned but one year, according to the chronology of archbishop Ussher; but Dr. Prideaux says, he reigned two years, and was succeeded by Neriglissar, his sister Nitocris's husband, who, having been at the head of a conspiracy that put him to death, reigned in his stead. Others will have it, that this prince was immediately succeeded by his son Belshazzar.

EULER, LEONARD, F. R. S. styled by Dr. Hutton, "one of the most extraordinary, and even prodigious, mathematical geniuses, that the world ever produced," was born at Basil, April 15, 1707. He was the son of Paul Euler, and Margaret Brucker, of an illustrious family in letters, and spent the years of his infancy, in a rural retreat at the village of Riehen, where his father was minister. He received his education in the university of Basil with a view to the church, but he devoted himself principally to mathematical studies under the famous John Bernoulli. In 1727 he followed his friends Hermann and Daniel Bernoulli to Petersburg, and was associated with them in the mathematical professorship. In 1730 he was appointed professor of natural philosophy, and on the departure of Daniel Bernoulli he succeeded him in the mathematical chair. In 1733, a problem was proposed by the academy which required expedition, and for the solution

of which several eminent mathematicians had demanded some months. The problem was solved by Euler in three days, to the great astonishment of the academy; but the violent and laborious efforts it cost him threw him into a fever, which endangered his life, and deprived him of the use of his right eye. The academy of sciences at Paris, which in 1738 had adjudged the prize to his memoir Concerning the Nature and Properties of Fire, proposed for the year 1740 the important subject of the tides; a problem whose solution required the most arduous calculations. Euler's discourse on this question was adjudged a master-piece of analysis and geometry; and it was more honourable for him to share the academical prize with such illustrious competitors as Colin MacLaurin and Daniel Bernouilli, than to have carried it away from rivals of less magnitude. Seldom if ever did such a brilliant competition adorn the annals of the academy; and perhaps no subject, proposed by that learned body, was ever treated with such accuracy of investigation and force of genius, as that which here displayed the philosophical powers of this extraordinary triumvirate. In 1741 he went to Berlin, at the invitation of the king, to assist in establishing the academy there. He continued at Berlin twenty-five years, and then returned to Petersburg, where he soon after entirely lost his sight. But still he continued his favourite pursuits, and it was in this distressing situation he dictated to his servant a tailor's apprentice, who was absolutely devoid of mathematical knowledge, his "Elements of Algebra;" which, by their intrinsic merit, in point of perspicuity and method, and the unhappy circumstances in which they were composed, have equally excited applause and astonishment. This work, though purely elementary, discovers proofs of a most inventive genius; and it is here alone that we meet with a complete theory of the analysis of Diophantus. About this time M. Euler was honoured by the Academy of Sciences at Paris with the place of one of its foreign members; and, the academical prize was adjudged to three of his memoirs, Concerning the Inequalities in the Motions of the Planets. The two prize questions, proposed by the same academy for 1770 and 1772, were designed to obtain from the labours of astronomers a more Perfect Theory of the Moon. M. Euler, assisted by his eldest son, was a competitor for these prizes, and obtained them both. He afterwards reviewed his whole theory, with the assistance of his son and Messrs. Krafft and Lexell, and pursued his researches until he had constructed the new tables, which appeared, together with the great work, in 1772. Instead of confining himself, as before, to the fruitless integration of three differential equations of the second degree, which are furnished by mathematical principles, he reduced them to the three ordinates, which determine the place of the moon; he divided into classes all the inequalities of that planet, as far as they depend either on the elongation of the sun and moon, or upon the eccentricity, or the parallax, or the inclination of the lunar orbit. All these means of investigation, employed with such art and dexterity as could only be expected from an analytical genius of the first rank, were attended with the greatest success; and it is impossible to observe, without admiration, such immense calculations on the one hand, and on the other the ingenious methods employed by this great man to abridge them, and to facilitate their application to the real motion of the moon. But this admiration becomes astonishment, when we consider at what period and in what circumstances all this was effectuated by M. Euler. It was when he was totally blind, and consequently obliged to arrange all his computations by the sole powers of his memory and genius. It was when he was embarrassed in his domestic circumstances by a dreadful fire, that had consumed great part of his substance, and forced him to quit a ruined house, of which every corner was known to him by habit, which, in some measure, supplied the place of sight. It was in these circumstances, that Euler composed a work which, alone, was sufficient to render his name immortal. Some time after this, the famous oculist, Wentzell, by couching the cataract, restored his sight; but the joy that this operation produced was of short duration. Some negligence on the part of his surgeons, and his own impatience to use an organ, whose cure was not completed, deprived him of his sight a second time; and this relapse was accompanied with tormenting pain. He, however, with the assistance of his sons, and of Messrs. Krafft and Lexell, continued his labours; neither the loss of his sight, nor the infirmities of an ad-

vanced age, could depress the ardour of his genius. He had engaged to furnish the academy of Petersburg with as many memoirs as would be sufficient to complete its acts for 20 years after his death. In 7 years he transmitted to the academy, by Mr. Golofkin above 70 memoirs, and above 250 more left behind him, were revised and completed by a friend. Such of these memoirs as were of ancient date were separated from the rest, and form a collection that was published in 1783, under the title of Analytical Works. Euler's knowledge was more universal than could well be expected in one, who had pursued, with such unremitting ardour, mathematics and astronomy as his favourite studies. He had made a very considerable progress in medical, botanical, and chemical science. What was still more extraordinary, he possessed what is generally called erudition in a very high degree. He had read the most eminent writers of ancient Rome; the civil and literary history of all ages and nations was familiar to him; and foreigners, who were only acquainted with his works, were astonished to find in the conversation of a man, who seemed solely occupied in mathematical and physical researches and discoveries, such an extensive acquaintance with the most interesting branches of literature. In this he was doubtless much indebted to a very uncommon memory, which seemed to retain every idea that was conveyed to it, either by reading or meditation. He could repeat the *Aeneid* of Virgil, from the beginning to the end, without hesitation, and indicate the first and last line of every page of the edition he used. Several attacks of a vertigo, in Sept. 1783, (which, however, did not prevent his calculating the motions of the aerostatic globes,) were the forerunners of his mild and happy passage from this scene to a better. While he was amusing himself at tea with one of his grandchildren, he was struck with an apoplexy, which terminated his illustrious career at the age of 76. His constitution was uncommonly strong and vigorous; his health was good; and the evening of his life was calm and serene, sweetened by the fame that follows genius, the public respect that is paid to exemplary virtue, and several domestic comforts which he was capable of feeling; and therefore deserved to enjoy. His works are so numerous that the printed catalogue alone extends to 50 pages; 14 of which contain those in M. S. The printed ones consist of works published separately, and works to be found in the memoirs of several academies, viz. in thirty-eight volumes of the Petersburg acts, (from six to ten papers in each volume); in several volumes of the Paris acts; in twenty-six volumes of the Berlin acts, (about five papers to each volume); in the *Acta Eruditorum*, in two volumes; in the *Miscellanea Taurinensia*; in vol. ix. of the *Society of Ulyssingue*; in the *Ephemeres* of Berlin; in the *Memoires de la Société Oeconomique*, for 1766.

EULOGY, EULOGIA, [from *eul*, bene, and *eu*, dico, q. d. *benedictum*, blessed,] a bit of consecrated bread. When the Greeks cut a loaf of bread to consecrate it, they break the rest into little bits, and distribute them among those who have not yet communicated, or who are absent; and these pieces of bread they call eulogies. The Latin church has had something like eulogies for many ages; and thence arose the use of their holy bread. The name was likewise given to loaves or cakes brought to church by the superstitious to have them blessed. It passed hence to mere presents, without any benediction. See Gretser. de Benedict. and Maledict. lib. ii. cap. 22, &c.

EUMARIDES, [of *eumagis*, easy,] among the ancients, a kind of shoes common to men and women. The eumarides were used for pomp and delicacy, being neat, and painted with various colours.

EUMENES, a Greek officer in the army of Alexander, son of a charioteer. He was the most worthy of all the officers of Alexander. He conquered Paphlagonia, and Cappadocia, of which he obtained the government, till the power and jealousy of Antigonus obliged him to retire. He joined his forces to those of Perdiccas, defeated Craterus and Neoptolemus, and killed the latter. When Craterus was afterwards killed, his remains received an honourable funeral from Eumenes, who, after weeping over the ashes of a man who once was his dearest friend, sent his remains to his relations in Macedonia. Eumenes fought against Antipater and conquered him; but after the death of Perdiccas his ally, he was conquered by Antigonus, chiefly through the treachery of his officers. Antigonus ordered Eumenes to be put to death in the prison, B. C. 315. Eumenes raised himself to power by merit alone. His skill

in public exercises first recommended him to the notice of Philip; and under Alexander, his fidelity and military accomplishments, promoted him to the rank of a general. Even his enemies revered him; and Antigonus, by whose orders he perished, honoured his remains with a splendid funeral, and conveyed his ashes to his wife and family in Cappadocia. Eumenes had such influence over the successors of Alexander, that none during his lifetime dared to assume the title of king.

EUMENES, a historian in Alexander's army.

EUMENES I. king of Pergamus, succeeded his uncle Philetærus about B. C. 264. He made war against Antiochus the son of Seleucus, and enlarged his possessions by seizing upon many cities of the kings of Syria. He lived in alliance with the Romans, and made war against Prusias king of Bithynia.

EUMENES II. succeeded his father Attalus on the throne of Asia and Pergamus. His kingdom was small and poor, but he rendered it powerful and opulent; and his alliance with the Romans contributed to the increase of his dominions after the victories obtained over Antiochus the Great. He carried his arms against Prusias and Antigonus; and died B. C. 160, after reigning 40 years, leaving the kingdom to his son Attalus II.

EUMENIDES, a name given to the Furies by the ancients. See **FURIES**. It seems to have been given them in irony, as *ευμενεια*, instead of vengeance, signifies benevolence.

EUMENIDIA, festivals in honour of the Eumenides, or Furies, celebrated annually with sacrifices of pregnant ewes, with offerings of cakes made by the most eminent youths, and libations of honey and wine.

EUMOLPIDES, the priests of Ceres at the celebration of her festivals at Eleusis; the descendants of Eumolpus, king of Thrace.

EUMOLPUS, in fabulous history, a king of Thrace, son of Neptune and Chione. He was thrown into the sea by his mother, who wished to conceal her shame from her father. Neptune saved his life, and carried him into Æthiopia, where he was brought up by a woman, one of whose daughters he married. An act of violence to his sister-in-law obliged him to leave Æthiopia, and he fled to Thrace with his son Ismarus, where he married the daughter of Tegyrus the king of the country. This connection rendered him ambitious; he conspired against his father-in-law, and fled, when the conspiracy was discovered, to Attica, where he was initiated in the mysteries of Ceres of Eleusis, and made hierophantes or high priest. He was afterwards reconciled to Tegyrus, and inherited his kingdom. He perished in battle about B. C. 1380.

EUNOMIANS, in church history, Christian heretics in the fourth century. They were a branch of Arians, and took their name and creed from Eunomius bishop of Cyzicus.

EUNOMIUS, a famous heresiarch of the fourth century, the disciple of Aetius, but more subtle than his master, as well as more bold in propagating the opinions of his sect. He died very old, about A. D. 374.

EUNUCH, is formed from *ευνυχη*, q. d. *lecti curam habet*, guardian or keeper of the bed. In Britain, France, &c. eunuchs are never made but upon occasion of some disease, which renders such an operation necessary: but in Italy they make great numbers of children, from one to three years of age, eunuchs, every year, to supply the operas and theatres of all Europe with singers. M. De La Lande, in his Voyage d'Italie, asserts, that there are public shops at Naples where this cruel operation is performed, and that over the door of these shops is inscribed *Qui si castrano ragazzi*. Yet Dr. Burney informs us, that he was not only utterly unable to see or hear of any such shops during his residence in that city, but was told, both by the natives and English settled there, that the laws against such a practice were so numerous and severe, that it was never performed but with the utmost secrecy. In the eastern parts of the world, they make eunuchs to be guards on their women. The seraglio of the eastern emperors are chiefly served and guarded by eunuchs; and yet, from good authority, we learn, that the rich eunuchs in Persia and other countries, keep seraglios for their own use! There are several severe prohibitions in Germany against the making of eunuchs. In France, under its late government, an eunuch could not marry, not even with the consent of the woman. Though the practice of castration is detestable in every point of view, yet there appears no real foundation for the injurious opinion generally entertained of eunuchs, viz. that they are all cowards, and devoid of genius for literature or any solid study. "As to genius," (says Dr. Burney,) I never

found those of the first class in music deficient in intellectual abilities for more serious studies. Indeed I have seen real genius and disposition for literary pursuits, in more than one great opera singer; and as for composition, and the theory of music, not only the best singers of the Pope's chapel ever since the beginning of the last century, but the best composers, are among the sopranis, in that service." With respect to the operation affecting the mind so much as to deprive it of all fortitude in times of danger, there is great reason to doubt the fact: most of the generals of eastern monarchs having been at all times of this class; and the bravest stand that ever was made against Alexander the Great was at Gaza, under the command of one of Darius's generals, who was an eunuch. Ammianus Marcellinus gives an account of Menophilus, an eunuch, to whom Mithridates intrusted his daughter; which proves that such unfortunate persons possess a heroism equal to that of the most determined Stoic. It is certain, that the ancients never supposed eunuchs men of inferior intellects, or that they possessed less vigour of mind than other men. At least the Persians were not of this opinion; for Herodotus relates, (Lib. vi. 32,) that when they had taken some Ionian cities, *παιδας τε τας ευειδεστας εκλεγομενοι εξεταμον, και αποειν αυτις ειναι ενορχους ευνυχους*. Herodotus, in relating the melancholy story of Hermotimus, says, that *παρὰ τοις βαρβαροις τιμιωτεροι εισι οι ευνυχους, πιστις ειναι πασης, των ενορχων*, "among the barbarians, eunuchs, are more valued than other men, on account of their universal fidelity." (Lib. viii. p. 668.) It appears from this passage, that in Persia eunuchs so far from being objects of contempt, were often promoted to the highest honours.

EUNUCHS, in church history, a sect of heretics in the third century, who were mad enough to castrate, not only those of their own persuasion, but even all others they could lay hold of. They took their rise from the example of Origen, who, misunderstanding these words of our Saviour, "and eunuchs who made themselves eunuchs for the kingdom of heaven," castrated himself. Those who, out of similar imprudent zeal, made themselves eunuchs, were, by the council of Nice, condemned and excluded from holy orders.

EVOCATION, [*evocatio*, Lat.] among the ancient Romans, a religious ceremony always observed by them at the undertaking of a siege, wherein they solemnly called upon the gods and goddesses of the place to forsake it and come over to them. Without performing this ceremony, they either thought the place could not be taken, or that it would be a sacrilege to take the gods prisoners. They took it for granted that their prayer was heard, and that the gods had deserted the place and come over to them, provided they were able to make themselves masters of it.

EVOLI, an ancient town of Naples, in the province of Principato Citra, 15 miles E.S.E. of Salerno.

EVOLVENT, in the higher geometry, a term used by some for the involute, or curve resulting from the evolution of a curve, in contradistinction to that evolute, or curve supposed to be opened and evolved.

EVOLUTE, [from *e*, out of, and *volvo*, to roll,] in the higher geometry, a curve first proposed by M. Huygens, and since much studied by mathematicians. It is any curve supposed to be evolved, by having a thread wrapped close upon it, fastened at one end, and beginning to evolve or unwind the thread from the other end, keeping the part evolved or wound off tight stretched: then this end of the thread will describe another curve, called the involute. Such is the curve BCF, (Plate LIX. fig. 13.) for if a thread, FCM, be wrapped about, or applied to, the said curve, and then unwound again, the point M thereof will describe another curve, AMM, called by Mr. Huygens, a curve described from evolution. The part of the thread, MC, is called the radius of the evolute, or of the osculatory circle described on the centre C, with the radius MC. Hence, 1. when the point B falls in A, the radius of the evolute MC is equal to the arch BC; but if not, to AB and the arch BC. 2. The Radius of the evolute CM is perpendicular to the curve AM. 3. Because the radius MC of the evolute continually touches it, it is evident from its generation, that it may be described through innumerable points, if the tangents in the parts of the evolute are produced until they become equal to their corresponding arches. 4. The evolute of the common parabola is a parabola of the second kind, whose parameter is $\frac{2}{3}$ of the common one. 5. The evolute of a cycloid is another cycloid equal and similar to it. 6. All the arches of evolute

curves are rectifiable, if the radii of the evolute can be expressed geometrically. Those who desire a more particular account of these curves, may refer to sir Isaac Newton's and Mac-Laurin's Fluxions, also Rowe's, Simpson's, and Vince's Fluxions.

EVOLUTION. See ARITHMETIC and ALGEBRA.

EVOLUTION, in the art of war, the motion made by a body of troops, when they are obliged to change their form and disposition, in order to preserve a post, or occupy another, to attack an enemy with more advantage, or to be in a condition of defending themselves the better. See TACTICS and DOUBLING.

EVOLVULUS, a genus of the tetragynia order and pentandria class of plants; natural order Campanaceæ. Calyx pentaphyllous; corolla quinquefid, verticillated; capsule trilocular; seeds solitary. It has seven species, natives of the West or East Indies.

EVONYMUS, the SPINDLE TREE: a genus of the monogynia order, and pentandria class of plants; natural order Dumosæ. Corolla pentapetalous; capsule pentagonal, quinquelocular, quinquevalved, coloured; seeds hooded. There are eight species, trees, or shrubs, with the smaller branches four-cornered.

EUPAREA, a genus of the class and order pentandria monogynia. Calyx five-leaved; corolla, five or twelve-petaled; berry superior, one-celled; seeds many. One species, an herbaceous plant of New Holland.

EVORA, or **ELVORA**, a city of Portugal, capital of the province of Alentejo; fortified with twelve bastions, and two half-bastions. It is seated among mountains, 65 miles E. of Lisbon.

EVOUTS, an island in the South Sea, 15 miles S. of Terra del Fuego.

EUPATORGIA, a town of Russia, in Taurida, on the Black Sea, 68 miles S.W. of Perekop.

EUPATORIUM, or **EUPATORY**, **HEMP AGRIMONY**: a genus of the polygamia aqualis order, and syngenesia class of plants; natural order, Compositæ. Receptacle naked; pappus feathery; calyx imbricated, oblong; style semibifid, long. There are forty-nine species, many of them herbaceous flowery perennials, producing annual stalks from two to three or five feet high, terminated by clusters of compound flowers of a red, purple, or white, colour. They are chiefly propagated by seeds, or parting the roots in autumn or spring. One of them, viz.

E. CANNABINUM, or **WATER HEMP AGRIMONY**, is a native of Britain. It is found wild by the sides of rivers and ditches, and has pale red blossoms. It has an acrid smell, and a very bitter taste, with a considerable share of pungency. The leaves are much recommended for strengthening the tone of the viscera, and is an aperient; it is said to have excellent effects in the dropsy, jaundice, cachexies, and scorbutic disorders.

EUPATRIDÆ, in antiquity, a name given by Theseus to the nobility of Athens, as distinguished from Geomori and Demiurgi. The Eupatridæ, by Theseus's establishment, had the right of choosing magistrates, teaching and dispensing the laws, and interpreting religious mysteries.

EUPHEMIA, or **ST. EUPHEMIA**, an ancient sea-port of Naples, 50 miles N.E. of Reggio.

EUPHEMISM, [from *eu*, good, and *φημι*, to say,] a representation of good qualities, a figure in oratory, in which a harsh expression is changed for one less offensive.

EUPHONIA, or **EUPHONY**, [*euphonia*,] in grammar, an easiness, smoothness, and elegance, of pronunciation. The word is formed of *eu*, good, and *φωνη*, voice. Quintilian calls euphonia, "vocalitas;" Scaliger, "facilis pronuntiatio." Euphonia is properly a kind of figure whereby we suppress a too harsh letter, or convert it into a smoother. There are many examples in all language.

EUPHORBIA, **SPURGE**, a genus of the trigynia order, and dodecandria class of plants; natural order, Tricocceæ. Corolla four or five petaled, placed on the calyx; calyx one-leaved, bellying; capsule tricoceous. There are ninety-eight species. These are milky plants, mostly herbaceous, a few shrubby upright for the most part, very few of them creeping. The juice of most of the species is so acrid that it corrodes and ulcerates the body wherever it is applied; so that physicians have seldom ventured to prescribe it internally. Warts, or corns, anointed with the juice, presently disappear. A drop of it put into the hollow of an aching tooth, gives relief, like other corrosives, by destroying the nerve. Some people rub it behind the ears, that it may blister.

E. CAPENSIS, a native of the Cape of Good Hope, supplies the Hottentots with an ingredient for poisoning their arrows. Their method of making this poison is by first mixing the juice extracted from the euphorbia with the substance of a caterpillar peculiar to another plant. They point their arrows with this composition, which is supposed to be the most effectual poison of the whole country. The euphorbia itself is also used for this purpose, by throwing the branches into fountains of water frequented by wild beasts, which, after drinking the water thus poisoned, seldom get a thousand yards from the brink of the fountain before they fall down and expire. No animal escapes which drinks of such water, though the flesh is not injured by the poison.

E. ESULA, another of the foreign species, is such a violent corrosive, that, if applied to any part of the body, it produces a violent inflammation, which is soon succeeded by a swelling that degenerates into a gangrene, and generally proves mortal. See Plate LXV.

EUPHORBBIUM, a gum resin, obtained from the euphorbia officinalis, a native of Ethiopia, by making incisions in the plant. It is brought from Africa in the form of tears, is soluble in alcohol. It has no smell; after a time it communicates a burning taste to the tongue. It is regarded as poisonous.

EUPHRASIA, **EUPHRASY**, or **EYE-BRIGHT**: a genus of the angiospermia order, and didynamia class of plants; natural order, Personatæ. Calyx four-clelt, cylindric; capsule two-celled, ovate, oblong; lower anthers have a little thorn at the base of one of the lobes. There are nine species, two are natives of Britain.

EUPHRATES, a river which all ancient geographers agree rises in Armenia Major; but in what particular spot, or in what direction it afterwards shapes its course, they greatly differ. Modern geographers describe the Euphrates, as rising from two sources; the one about a day's journey, the other two day's journey from Erzerum. They both lie to the eastward, on high mountains, covered with snow almost all the year round. The plain of Erzerum is inclosed between two fine streams, which, when united, are called the Euphrates, or the Frat. It first divides Armenia from Natolia; then Syria from Diarbeck; after which it runs through Irac Arabia till it meets the Tigris. It is also the N. E. boundary of the great desert of Arabia.

EUPHRATES, a river of Africa, in the country of Whidah, on the Slave Coast.

EUPHROSINE, one of the three Graces.

EUPLÆA, a name of Venus.

EURE, a river of France, which rises in the forest of Logny, near Pointgoin, and falls into the Seine above Point d'Arche.

EURE, a department of France, so named from the river which crosses it; bounded on the N. by the dept. of the Lower Seine; on the E. by that of the Oise; on the S. by those of the Eure and Loire, and the Orne; and on the W. by that of Calvados. It includes part of the late province of Normandy. Evreux is the capital.

EURE, and **LOIRE**, a department of France. The rivers Eure and Loire run through it. It contains the late province of Beauce. Chartres is the capital.

EVREUX, an ancient town of France, in the department of Eure, and late province of Normandy, 25 miles S. of Rouen, and 55 N. W. of Paris.

EURIPIDES, a celebrated Greek poet, who excelled in tragedy, born about B. C. 468, in the isle of Salamis, on the day that Xerxes was defeated. He learned rhetoric under Prodicus, morality under Socrates, and natural philosophy under Anaxagoras; but at 18 years of age abandoned philosophy, for dramatic poetry. He used to shut himself up in a cave to compose his tragedies, which were extremely applauded by the Greeks. The Athenian army, commanded by Nicias, being defeated in Sicily, the soldiers purchased their lives and liberties by reciting the verses of Euripides. Euripides frequently intersperses through them moral sentences, and severe reflections on the fair sex; whence he was called the woman-hater. He was, nevertheless, married; but the scandalous lives of his two wives drew upon him the railery of Aristophanes, and other comic poets; which occasioned his retiring to the court of Archelaus, king of Macedon, where he was well received. That prince was fond of learned men, and drew them to him by his liberality. Solinus says, he made Euripides his minister of state, and gave him other extraordinary proofs of his

Longitude as East from London.

Longitude as West from London.

his esteem. But a few years after, an unhappy accident put an end to his life. He was walking in a wood, in deep meditation; when, happening upon Archelaus's hounds, he was by them torn in pieces. It is not certain whether his death happened by chance, or through envy of some courtiers. Archelaus buried him with great magnificence; and the Athenians were so much afflicted at his death, that the whole city went into mourning. Of 92 tragedies which he composed, only 19 remain: the most valuable editions of which are those of Aldus, in 1503, 8vo; of Plantin, in 1570, 16mo; of Commelin, in 1597, 8vo; of Paul Stevens, in 1604, 4to; and of Joshua Barnes, in 1694, folio.

EURIPUS, now the **NEGROPONT**, a canal or strait which divides the island of Eubœa from the continent of Greece. In one place it is so narrow, that a galley can scarce pass through it. The agitations of the Euripus were much spoken of by the ancients. Some say that the canal has a flux and reflux six times in 24 hours; others, that it ebbs and flows seven times a-day: but Livy does not allow this flux and reflux to be so regular. Father Babin, a Jesuit of great learning, who made many observations on the spot during his long abode in the island of Negropont, tells us, that the Euripus is regular in its ebbing and flowing the first eight days of the moon: the same regularity he observed from the 14th to the 20th day inclusive, and in the three last days: but in the other days of the lunar month, it is not so regular; for it sometimes ebbs and flows 11, 12, 13, and 14, times in a natural day. In this place, it is said, Aristotle drowned himself out of chagrin, for not being able to account for so unusual a motion.

EURIPUS, has since become a general name for all straits, where the water is in great motion and agitation.

EURITHMY, [from *ευ*, easily, and *ρυθμος*, number, or order,] in architecture, sculpture, painting, &c. is a kind of majestic appearance, with the exact proportion between all the parts of any building, or picture.

EUROCLYDON, [of *ευρος*, the east wind, and *κλυδων*, a wave,] is a species of wind, of which we have an account only in Acts xxvii. 14, and concerning the nature of which critics have been much divided. Bochart, Grotius, Bentley, and others, substitute another reading, supported by the Alexandrian MS. and the Vulgate, viz. *Ευροκλυδων*, or Euro-aquilo; but Mr. Bryant defends the common reading, and considers the Euroclydon, *ἡ εὐροκλυδων*, as an E. wind that causes a deep sea or vast inundation. Dr. Bentley supposes that the mariners in the ship, the voyage of which is recited in this passage, were Romans; but Mr. Bryant maintains that they were Greeks of Alexandria, and that the ship was an Alexandrian ship employed in the traffic of carrying corn to Italy; and therefore, that the mariners had a name in their own language for the particular typhonic or stormy wind here mentioned. He also shews from the passage itself, that the tempestuous wind called Euroclydon, beat (*κατ' αὐτὴν*) upon the island of Crete; and therefore, as this is a relative expression, referring to the situation of the person who speaks of it, who was at that time to the windward or south of it, the wind blew upon shore, and must have come from the S. or S. E. which, he adds, is fully warranted by the point where the ship was, and the direction it ran in afterwards, which was towards the N. and N. W.

EUROPA, in fabulous history, a daughter of Agenor king of Phœnicia and Telephassa. Jupiter became enamoured of her, and to seduce her, assumed the shape of a bull, and mingled with the herds of Agenor, while Europa and her female attendants were gathering flowers. Europa caressed the beautiful animal; and at last had the courage to sit upon his back. The god retired towards the shore, crossed the sea, and carried Europa in safety to Crete; where, assuming his original shape, he declared his love. The nymph consented, and became mother of Minos, Sarpedon, and Rhadamanthus. After this she married Asterius, king of Crete, who adopted her sons. Some suppose that Europa lived about B. C. 1552.

EUROPE, one of the four general divisions of the world, called by the people of Asia, Frankistan, is bounded on the N. by the Frozen Ocean, on the W. by the Western Ocean, on the S. by the Mediterranean, which separates it from Africa; and on the E. by Asia. It is situated between Lon. 9. 35. W. and 72. 25. E. and between Lat. 35° and 72° N. Europe is about 3600 miles in length, from Cape St. Vincent in Portugal, to the Oby in Russia; and 2700 miles in breadth, from Cape Matapan, in the Morea, to the North Cape in Lapland. It is much less than Asia and Afri-

ca; but in many respects surpasses them both. Europe, excepting a small part of Lapland and Russia, is situated in the temperate zone; whence its inhabitants neither feel the extremities of heat, nor of cold. It cannot boast of rich mines of gold, silver, and precious stones; nor does it produce sugar or spices, nor elephants, camels, &c.; but it abounds with corn, wine, fruits, sheep, horses, black cattle, and all the necessaries of life. It is much more populous, and better cultivated than Asia, Africa, or America; it is more full of cities, towns, and villages, great and small, and its buildings are more solid and commodious. Europe may be divided into 11 great parts, including their dependencies: 1. Sweden; 2. Denmark and Norway; 3. Russia; 4. Germany; 5. Batavia, or Holland; 6. France; 7. Switzerland; 8. Spain; 9. Italy; 10. Turkey; and 11. the Islands. The greatest cities are, London, Paris, Amsterdam, Constantinople, Moscow, and Rome. The principal islands are Great Britain, Ireland, the Hebrides, the Orkneys, Iceland, the Ferro isles, Sicily, Sardinia, Corsica, Candy, Majorca, Minorca, Funen, Rugen, Bornholm, Oesel, Gothland, Zealand, &c. The languages are the Italian, French, Spanish, and Portuguese, which are the dialects of the Latin; the German, Flemish, Dutch, Swedish, Danish, and English, which proceed from the Teutonic; the Slavonian, which reigns (though in disguise) in Poland, Russia, Bohemia, and a great part of Turkey in Europe; the Celtic, of which there are dialects in Wales, the Highlands of Scotland, Ireland, Bretagne in France, and Lapland; the modern Greek, and several others. The population of Europe is estimated at 150 millions; but it is doubtless capable of supporting a much greater number. There are five principal religions in Europe, viz. the Mohammedan, in Turkey; the Greek, in many parts of Turkey, in all Muscovy, and in several parts of Polish Russia; the Roman Catholic in Spain, Portugal, and Italy; and the Protestant, in its two chief divisions of Lutheran and Calvinist, but with considerable differences, in Great Britain, Denmark, Sweden, and Norway. There is a mixture of Catholics and Protestants in Ireland, Switzerland, Germany, Poland, Hungary, and Belgium; besides many Jews, and some Pagans in Lapland and the northern parts of Muscovy. The chief rivers are the Danube, Dniester, Dnieper, Vistula, Volga, Dwina, Bog, Oby, Don, Scheldt, Rhine, Rhone, Seine, Loire, Garonne, Forth, Tweed, Tajo, Thames, Tay, Tiber, Shannon, and Severn. The principal lakes are those of Constance, Geneva, Lausanne, Wener, Ladoga, and Onega. The chief mountains are the Alps, Appennines, and Pyrenees. See the above countries, towns, &c. in their order.

EUROPEANS, the inhabitants of Europe. They are all white, and incomparably more handsome than the Africans, and even than most of the Asiatics. The Europeans surpass both in arts and sciences, especially in those called liberal; in trade, navigation, and in military and civil affairs; being, at the same time, more prudent, more valiant, more generous, more polite, and more sociable than they.

EURYA, in botany, a genus of the dodecandria monogynia class and order. Calyx five-leaved, calyced; corolla five-petaled; stamina thirteen; capsule five-celled. One species, viz. *E. japonica*, a native of Japan.

EURYANDRA, in botany, a genus of the polyandria trigynia class and order; natural order, Coadunata. Calyx five-leaved; corolla three-petaled; filament much dilated at the tip, with twin disjoined anthers; follicles three. One species, viz. *E. scandens*, a native of new Caledonia.

EURYDICE, in fabulous history, the wife of Orpheus, who, flying from Aristæus that endeavoured to ravish her, was slain by a serpent.

EURYSTHEUS, in fabulous history, king of Argos and Mycenæ, son of Amphitryon, or, according to others, of Sthenelus and Nicippe, the daughter of Pelops. Juno hastened his birth by two months, that he might come into the world before Hercules the son of Alcmena, as the younger of the two was doomed by Jupiter to be subservient to the will of the other.

EURYTHMY, [*ευρυθμία*,] in architecture, painting, and sculpture, is a certain majesty, elegance, and easiness, appearing in the composition of divers members, or parts of a body, painting or sculpture, and resulting from the fine proportion of it.

EUSEBIUS, surnamed **PAMPHILUS**, one of the most learned men of his time, born in Palestine in the reign of Gallienus. He was the intimate friend of Pamphilus the martyr; and after his death took his name. He was ordained bishop of Cæsarea in

313. He had a considerable share in the contest relating to Arius; whose cause he and several other bishops defended, being persuaded that Arius had been unjustly persecuted by Alexander, bishop of Alexandria. He assisted at the council of Nice in 325; when he made a speech to the emperor Constantine on his coming to the council, and was placed next him on his right hand. He was present at the council of Antioch, in which Eustathius, bishop of that city, was deposed; but though he was chosen by the bishop and people of Antioch to succeed him, he refused it. In 335 he assisted at the council of Tyre held against Athanasius; and at the assembly of bishops at Jerusalem, at the dedication of the church there. By these bishops he was sent to the emperor Constantine to defend what they had done against Athanasius; when he pronounced the panegyric on that emperor, during the public rejoicings, in the thirtieth year of his reign. Eusebius died in 338. He wrote, 1. An Ecclesiastical History, of which Valesius has given a good edition in Greek and Latin; but the best is the Cambridge edition, 3 vols. folio, 1720. 2. The Life of Constantine: 3. A Treatise against Hierocles: 4. Chronicon: 5. Preparationes Evangelicæ: 6. Demonstratio Evangelica, an invaluable work: the best edition yet published is that of Franc. Vigero. Greek and Latin, Rothomag, 1628.

EUSTACHIAN TUBE, in anatomy, begins from the interior extremity of the tympanum, and runs forward and inwards in a bony canal, which terminates with a portion of the temporal bone. See ANATOMY.

EUSTATHIANS, a name given to the Catholics of Antioch in the 4th century, on occasion of their refusal to acknowledge any other bishop beside St. Eustathius, deposed by the Arians. This denomination was given them during the episcopate of Paulinus, whom the Arians substituted to St. Eustathius, about A. D. 330, when they began to hold their assemblies apart.

EUSTATHIANS, a sect of heretics in the 4th century, denominated from their founder Eustathius, a monk so foolishly fond of his own profession, that he condemned all other conditions of life. Whether this Eustathius was the same with the bishop of Sebastia and chief of the Semiarisians, is not certain.

EUSTATHIUS, a monk of the 4th century, who excluded married people from salvation; prohibited his followers from praying in their houses; and obliged them to quit all they had as incompatible with the hopes of heaven.

EUSTATHIUS, Archbishop of Thessalonica, in the 12th century, under the emperors Emanuel, Alexander, and Andronicus Comnenus. He was an eminent grammarian: and wrote commentaries upon Homer, and Dionysius the geographer. The best edition of his commentaries on Homer is that of Rome, printed in Greek, in 1542, in 4 vols. folio. His commentaries on the Periegesis of Dionysius were printed by Mr. Hudson at Oxford, in 1697, 8vo. He was alive in 1194.

EUSTATIA, or **EUSTATIUS**, Sr. one of the Caribbee islands, belonging till very lately to the Dutch. It is little else than a huge mountain, which formerly has, in all probability, been a volcano.

EUSTATIUS ST. or EUSTATIA TOWN, the capital of the above island. Lon. 63. 5. W. Lat. 17. 29. N.

EUSTEPHIA, in botany, a genus of the hexandria monogynia class and order. Corolla superior, tubular, cylindrical, bifid; nectary six cavities in the tube of the corolla; filaments, tricuspidate, distinct. It has one species, viz. the coccinea.

EUSTYLE, [from *ευσταλός*, of *eu*, proper, and, *σταλός*, a column,] in architecture, is a sort of building in which the pillars are placed at the most convenient distance one from the other.

EUTHYMIA, [from *eu*, good, and *θυμος*, the mind,] such a state of the mind, as could not be ruffled either by good or bad fortune, by sickness or health, good or evil.

EUTYCHES, an archimandrite or abbot of a monastery at Constantinople, who began to propagate his opinion against the two natures in Christ, A. D. 448. He did not, however, seem quite consistent in his sentiments: for he allowed of two natures before the union; he believed that the soul of Jesus Christ had been united to the divinity before the incarnation; but he allowed no distinction of natures in Jesus Christ since his incarnation; alleging that the Divine Nature had swallowed up the human.

EUTYCHIANS, ancient heretics, who denied the two natures in Christ; thus denominated from Eutyches.

EUTYCHIANS, another sect, half Arian; half Eunomian; which arose at Constantinople in the 4th century.

EUTYCHIUS, the founder of the last mentioned sect, with one Theopronius, were the movers of all the changes made by the Eunomians in the administration of baptism; which consisted, according to Nicephorus, in only using one immersion, and not doing it in the name of the Trinity, but in memory of the death of Jesus Christ.

EUXINE, or **BLACK SEA**, forms part of the boundary betwixt Europe and Asia. It receives the Dnieper, the Danube, and other large rivers; and extends from 28° to 41° Lon. E. and from 40° to 46° Lat. N. The ancients imagined this sea to have been originally only a lake, which broke first in the Propontis, and then into the Aegean, washing away by degrees the earth which first kept it within bounds, and formed the two channels of the Bosphorus Thracius and Hellespont, now the Dardanelles.

EWEL, a town of Surrey, 10 miles N. E. by N. of Dorking, and 13 S. E. by E. of London.

EWRY, an office in the king's household, where they take care of the linen for the king's table, lay the cloth and serve up water in silver ewers after dinner.

EX, a Latin preposition often prefixed to compounded words; sometimes meaning *out*, as exhaust, to draw out; sometimes only enforcing the meaning, and sometimes producing little alteration.

EX OFFICIO, among lawyers, signifies the power a person has, by virtue of his office, to do certain acts without being applied to.

EX POST FACTO, in law, something done after another; thus an estate granted may be good by matter *ex post facto*, that was not so at first, as in case of election.

EX, in geography, a river of Somersetshire, which rises in a barren tract of land, called Exmoor; runs by Tiverton, washes the walls of Exeter; and falls into the English channel at Exmouth, after a course of about 40 miles.

EXACTION, in law, a wrong done by an officer, or a person in pretended authority, in taking a reward or fee that is not allowed by law. A person guilty of exaction may be fined and imprisoned.

EXACUM, a genus of the monogynia order, and tetrandria class of plants; natural order, Rotaceæ. Calyx four-leaved; corolla salver-shaped, with an inflated tube; capsule two-furrowed, two-celled, many-seeded, bursting at the top. There are ten species.

EXÆRESIS, in surgery, the operation of extracting, or taking away, something that is hurtful to the human body.

EXAGGERATION, in rhetoric, a kind of hyperbole, whereby things are augmented or amplified, by saying more than the truth, either as to good or bad. There are two kinds of exaggeration; the one of things, the other of words. The first is produced, 1. By a multitude of definitions. 2. By a multitude of adjuncts. 3. By a detail of causes and effects. 4. By an enumeration of consequences. 5. By comparisons. And 6. By the contrast of epithets and rational inference. Exaggeration by words is effected, 1. By using metaphors. 2. By hyperboles. 3. By synonymous terms. 4. By a collection of splendid and magnificent expressions. 5. By periphrasis. 6. By repetition. And, lastly, by confirmation with an oath: as for example, "Parietes, medius fidius, gratias tibi agere gestiunt."

EXAGGERATION, in painting, a method by which the artist, in representing things, charges them too much, or makes them too strong, either in respect of the design or colouring. It differs from caricature, in that the latter perverts or gives a turn to the features of a face, &c. which they had not; whereas exaggeration only heightens or improves what they had.

EXALTATION, in astrology, is a dignity which it is pretended a planet acquires in certain signs or parts of the zodiac, which dignity is supposed to give it an extraordinary efficacy and influence. Thus the 15° of cancer is the exaltation of Jupiter.

EXALTATION, in chemistry, signifies an operation by which a substance has its properties changed, and raised to a higher degree of efficacy or virtue.

EXALTATION OF THE CROSS, a feast of the Latin church, held on the 14th September in memory of the emperor Heraclius having brought back the true cross of Jesus Christ on his shoulders,

ders, to the place on mount Calvary, from which it had been carried away 14 years before by Cosroes king of Persia, when he took Jerusalem, in the reign of Phocas.

EXAMINATION, in devotion. See **SELF-EXAMINATION**.

EXAMINATION. Justices before whom any person shall be brought for manslaughter or for felony, or for suspicion thereof, before they commit such prisoner, shall take his examination, and information of those who bring him, of the fact and circumstances; and as much thereof as shall be material to prove the felony, shall be put in writing within two days after the examination; and the same shall certify in such manner as they should do if such prisoner had been bailed, upon such pain as in the act 1 and 2 P. and M. c. 13, is limited.

EXAMINERS, in chancery, two officers of that court, who examine, upon oath, witnesses in causes depending there, where the witnesses live in London or near it. In the country, above 20 miles from London, on the parties joining in commission, witnesses are examined by commissioners, who are usually counselors or attorneys not concerned in the cause.

EXAMPLE, in a moral sense, is either taken for a precedent, for our admonition, that we may be cautioned against the faults or crimes which others have committed; or, for a pattern for our imitation. In the latter sense, the example of our Saviour is most proper to form us to holiness. There is no example of a mere man that is to be followed without limitation; but the example of Christ is absolutely perfect; his conversation was a living law.

EXAMPLE, in rhetoric, denotes an imperfect kind of argumentation; whereby it is pleaded, that a thing which happened on some former occasion will happen again on the present one; from the similitude of the cases.

EXANTHEMA, [*εξανθημα*], among physicians, denotes any kind of efflorescence or eruption, as the measles, purple spots in the plague, or malignant fevers, &c. According to Dr. Cullen it is an order in the class pyrexia, and includes all contagious diseases, beginning with fever, and followed by an eruption on the skin.

EXARCH, [*Εξαρχος*], an appellation given, by the eastern emperors to certain officers sent into Italy, in quality of vicars or prefects, to defend that part of Italy, which was yet under their obedience; particularly the city of Ravenna against the Lombards, who had made themselves masters of the greatest part of the rest.

EXARCH, in the eastern church antiquity, a superior over several monasteries; the same that we otherwise call Archimandrite; being exempted, by the patriarch of Constantinople, from the jurisdiction of the bishops.

EXARCH also denotes an officer, still subsisting in the Greek church; being a kind of deputy or legate a latere of the patriarch, whose office it is to visit the provinces allotted him, to inform himself of the lives of the clergy; take cognizance of ecclesiastical causes; the manner of celebrating divine service; the sacraments, particularly confession; the observance of the canons; monastic discipline; affairs of marriages, divorces, &c.

EXARCHUS, a title given by Homer, Philo, and other ancient authors, to the choragus or master of the singers, in the ancient choruses, or him who sung first: the word *αρχων*, or *αρχομαι*, signifying equally to begin, and to command.

EXAUCTORATIO, in the ancient Roman military discipline, differed from the Missio, which was a full discharge, and took place after they had served in the army 20 years; whereas the exauكتورatio was only a partial discharge, which was granted after seventeen years service.

EXCALCEATION, among the Hebrews, a law, whereby a widow, whom her husband's brother refused to marry, had a right to summon him to a court of justice; and, upon his refusal, might excalceate him, i. e. pull off one of his shoes, and spit in his face, by way of ignominy.

EXCELLENCY, a title anciently given to kings and emperors, but now to ambassadors, and other persons, who are not qualified for that of highness, and yet are to be elevated above the other inferior dignities. In England and France the title is now peculiar to ambassadors, but very common in Germany and Italy. Those it was first appropriated to, were the princes of the blood of the several royal houses; but they quitted it for that of highness, upon several great lords assuming excellency.

EXCENTRIC, or **EXCENTRICAL**, [from *εξ*, ex, *κεντρον*, centrum, the centre,] deviating from a centre.

EXCENTRIC ANOMALY, in astronomy, or Anomaly of the Centre, is an arc AQ of the excentric circle, intercepted between the aphelion A, and the right line QH, drawn through the centre P of the planet perpendicular to the line of the apsis AB. See Plate LIX. fig. 14.

EXCENTRIC CIRCLE, or **EXCENTRIC**, in the ancient Ptolemaic astronomy, was the very orbit of the planet itself, which it was supposed to describe about the earth, and to be excentric with it; called also the deferent.

EXCENTRIC CIRCLE, in the new astronomy, is the circle described from the centre of the orbit of a planet, with half the greatest axis as a radius; or the circle that circumscribes the elliptic orbit of the planet; as the circle AQB. Plate LIX. fig. 14.

EXCENTRIC EQUATION, in the old astronomy, is an angle made by a line drawn from the centre of the earth, with another line drawn from the centre of the excentric, to the body or place of any planet. This is the same with the prosthapheresis; and is equal to the difference, accounted in an arch of the ecliptic, between the real and apparent place of the sun or planet.

EXCENTRIC PLACE OF A PLANET, IN ITS ORBIT, is the heliocentric place, or that in which it appears as seen from the sun.

EXCENTRIC PLACE OF A PLANET, IN THE ECLIPTIC, is the point of the ecliptic to which the planet is referred as viewed from the sun; and which coincides with the heliocentric longitude.

EXCENTRICITY, in the ancient astronomy, is the distance between the centre of a planet and the centre of the earth. That the planets have such an excentricity, is allowed on all sides, and may be evinced from various circumstances; and especially this, that they sometimes appear larger and at others less; which can only proceed from hence, that their orbits being excentric to the earth, in some parts of those orbits the planets are nearer to us, and in others more remote. The excentricities of the sun and moon are sufficiently proved, both from eclipses, from the moon's greater and less parallax at the same distance from the zenith, and from the sun's continuing longer by eight days in the northern hemisphere than in the southern one. See **ASTRONOMY**.

EXCENTRICITY, in the new astronomy, is the distance CS, Plate LIX. fig. 14, between the sun S and the centre C of a planet's orbit; or the distance of the centre from the focus of the elliptic orbit; called also the simple or single excentricity. When the greatest equation of the centre is given, the excentricity of the earth's orbit may be found by the following proportion; viz. As the diameter of a circle in degrees, is to the diameter in equal parts; so is the greatest equation of the centre in degrees, to the excentricity in equal parts. Or, since it is found that the sun's greatest apparent semi-diameter is to his least, as $32' 43''$ to $31' 38''$, or as $1963''$ to $1898''$; the sun's greatest distance from the earth will be to his least, or AS to SB, as 1963 to 1898 ; of which the half dif. is $32\frac{1}{2} = CS$, and half sum $1930\frac{1}{2} = CB$; wherefore, as $1930\frac{1}{2} : 32\frac{1}{2} :: 1 : .016335 = CS$ the excentricity to the mean distance or semi-axis 1; which is nearly the same as before. See **ASTRONOMY**.

EXCENTRICITY, DOUBLE, is the distance between the two foci of the elliptic orbit, and is equal to double the single excentricity above given.

EXCEPTION, in law, denotes a stop or stay to an action; and is either dilatory or peremptory, in proceedings at common law; but in chancery it is what the plaintiff alleges against the sufficiency of an answer, &c. An exception is the denial of what is taken to be good by the other party, either in point of law or pleading. The counsel in a cause are to take all their exceptions to the record at one time, and before the court has delivered any opinion on it.

EXCEPTION TO EVIDENCE, is where a demurrer is offered in any civil cause, for the insufficiency of the evidence given, and the court does not agree to it; in such case, the court, upon request, is to seal a bill of exceptions to the evidence, which may be heard on a writ of error. A plaintiff or defendant may also allege any exception to the judge's opinion, praying the same to be allowed; and if the judge refuse it, then the party concerned is to write it down, and, when signed by counsel, require the judge to seal the same, to be heard afterwards.

EXCEPTIONS

EXCEPTIONS IN DEEDS AND WRITINGS, is the saving of a particular thing out of a general one granted by deed, as a room, shop, or cellar out of a house; a field, or timber trees, out of land, &c.

EXCESS, in arithmetic and geometry, is the difference between any two unequal numbers or quantities, or that which is left after the less is taken from or out of the greater.

EXCHANGE, in architecture, a place in most trading cities, wherein the merchants, negociants, agents, bankers, brokers, interpreters, and other persons concerned in commerce, meet on certain days, and at certain hours, to confer together of matters relating to exchanges, remittances, payments, adventures, assurances, freightments, and other mercantile negotiations, both by sea and land. In Holland, the late Flanders, and several cities of France, these places are called burses; at Paris and Lyons, places de change; and in the Hanse Towns, colleges of merchants. These assemblies are held with so much exactness, and merchants and negotiants are so indispensably required to attend at them, that absence alone makes a man suspected of bankruptcy. The most considerable exchanges in Europe, are that of Amsterdam, and that of London, called the Royal Exchange. Even in the time of the ancient Romans, there were places for the merchants to meet, in most of the considerable cities of the empire.

EXCHANGE, in arithmetic. See **ARITHMETIC**. The operations are only different applications of the Rule of Three, or of Practice; to perform which, it is necessary to know the value of the coins and monies of account of different countries, and their proportions to each other; for which see the various tables under the articles **MONEY** and **COINS**.

EXCHANGE, in ancient commerce, an agreement, whereby one thing was trucked or given for another. The first commerce carried on among men was by exchange; people furnished each other mutually with what things they wanted; but such exchanges were clogged with two considerable difficulties. 1. On account of the unequal value of commodities; and, 2. Because every body had not just what might accommodate the person with whom he would exchange. To remove these inconveniencies, money was invented for a common medium; and instead of exchanging, buying and selling were introduced. There are some nations among whom the primitive way of exchange still obtains; and even the most civilized people must sometimes have recourse to this method. Such, e. g. is the trade of several cities of the North and Baltic Sea, where the French exchange their wines and brandies for wood, metals, hemp, and furs.

EXCHANGE, in modern commerce, is the receiving or paying of money in one country for the like sum in another, by bills of exchange. See **BILL**. The punctuality of acquitting these obligations is essential to commerce; and no sooner is a merchant's accepted bill protested, than he is considered as a bankrupt. For this reason, the laws of most nations have given very extraordinary privileges to bills of exchange. Were the claims of merchants to linger under the formalities of courts of law when liquidated by bills of exchange, faith, confidence, and punctuality, would quickly disappear, and the great engine of commerce would be totally destroyed. A regular bill of exchange is a mercantile contract, in which four persons are concerned, viz. 1. The drawer, who receives the value. 2. His debtor, in a distant place, upon whom the bill is drawn, and who must accept and pay it. 3. The person who gives value for the bill, to whose order it is to be paid: and, 4. The person to whom it is ordered to be paid, creditor to the third. By this operation, reciprocal and equal debts, due in two distant parts, are paid by a sort of transfer of debtors and creditors. Thus A in London is creditor to B in Paris, value 100*l*. C again in London is debtor to D in Paris for a like sum. By the operation of the bill of exchange, the London creditor is paid by the London debtor; and the Paris creditor is paid by the Paris debtor; consequently, the two debts are paid, and no money is sent from London to Paris nor from Paris to London. In this example, A is the drawer, B is the acceptor, C is the purchaser of the bill, and D receives the money. Two persons here receive the money, A and D; and two pay the money, B and C; which is just what must be done when two debtors and two creditors clear accounts. This is the plain principle of a bill of exchange; which, among other advantages, prevents all risk of loss by shipwreck, robbery, &c. which might hap-

pen from remitting payment in coin. But when the reciprocal debts are not equal, there arises a balance on one side. Suppose London to owe Paris a balance, value 100*l*. An exchanger, finding a demand for a bill upon Paris for 100*l*. when Paris owes no more to London, sends 100*l*. to his correspondent at Paris in coin, at the expence (suppose) of 1*l*.; and then, having become creditor on Paris, he can give a bill for the value of 100*l*. upon his being repaid his expence, and paid for his risk and trouble. When merchants have occasion to draw and remit bills for the liquidation of their own debts, active and passive, in distant parts, they meet upon 'Change; where, (to continue the example,) the creditors upon Paris, when they want money for bills, look out for those who are debtors to it. The debtors to Paris again, when they want bills for money, seek for those who are creditors upon it. This market is constantly attended by brokers, who relieve the merchant of the trouble of searching for those he wants. To the broker every one communicates his wants, so far as he finds it prudent; and by going about among all the merchants, the broker discovers the side upon which the greater demand lies, for money or for bills. This renders secrecy very essential to individuals among the merchants. If the London merchants want to pay their debts to Paris, when there is a balance against London, it is their interest to conceal their debts, and especially the necessity they may be under to pay them: lest those who are creditors upon Paris should demand too high a price for the exchange above par. On the other hand, those who are creditors upon Paris, when Paris owes a balance to London, are as careful in concealing what is owing to them by Paris, lest those who are debtors to Paris should avail themselves of the competition among the Paris creditors, to obtain bills for their money, below their value at par. A creditor upon Paris, who is pressed for money at London, will abate something of his debt, in order to get money for it. Thus the merchants upon 'Change, from their separate and jarring interests, are constantly interested in the state of balance. Those who are creditors upon Paris, fear the balance due to London; those who are debtors to Paris, dread a balance due to Paris. The brokers determine the course of the day; and the most intelligent merchants dispatch their business before the fact is generally known. In this complicated operation, the interest of trade and of the nation is concerned in the proper method of paying and receiving the balances, and in preserving a just equality of profit and loss among all the merchants, relative to the real state of the balance. Unequal competition among men engaged in the same pursuit, consequently draws along with it bad consequences to the general undertaking; and secrecy in trade will be found more useful to merchants in their private capacity, than to the trade they are carrying on. This operation of exchange is of such a nature, that it is hardly possible for a merchant to carry on the business of these bills, without the assistance of the brokers upon many occasions. When merchants come upon 'Change, they are so full of jealousies, that they will not open their minds to one another. The broker is a confidential man between parties, and brings them together. Besides the merchants who circulate among themselves their reciprocal debts and credits arising from their importation and exportation of goods, there is another set of merchants who deal in exchange; by the importation and exportation of money and bills. Were there never any balance on the trade of nations, exchangers and brokers would find little employment: reciprocal and equal debts would easily be transacted openly between the parties themselves. But when balances come to be paid, exchange becomes intricate; and merchants are so much employed in particular branches of business, that they are obliged to leave the liquidation of their debts to a set of men, who make it turn out to the best advantage to themselves. Whenever a balance is to be paid, that payment costs an additional expence to those of the place who owe it, over and above the value of the debt. If, therefore, this expence be a loss to the trading man, he must either be repaid this loss by those whom he serves, that is, by the nation; or the trade he carries on will become less profitable. It is therefore plain, that the expence of high exchange upon paying a balance is a loss to a people, not to be compensated by enriching the few individuals among them who gain by contriving methods to pay it off. Whatever renders the profit upon trade precarious or uncertain, is a loss to trade in general.

EXCHANGE is sometimes also used for the agio, or profit allowed

lowed for the monies, advanced in any one's behalf. Thus it is a fixing of the actual and momentary value of money. Silver as a metal has a value like all other merchandise; and an additional value, as it is capable of becoming the sign of other merchandise. If it was no more than a mere merchandise, it would perhaps lose much of its nominal value. As a money, silver has a value which the prince in some respects can fix, but in others he cannot. The prince establishes a proportion between a quantity of silver, as a metal, and the same quantity, as money. He fixes the proportion between the several metals made use of as money; he establishes the weight and standard of every piece of money; in fine, he gives to every piece that ideal value already mentioned. The value of money in all these respects, may be stiled its positive value, because it may be fixed by law. The coin of every state has also a relative value as compared with the money of other countries. This relative value is established by the exchange, and greatly depends on its positive value. It is fixed by the current course of commerce, and by the general opinion and consent of merchants, but never by the decrees of the prince, because it is liable to incessant variations, depending upon the accidental circumstances of trade, the money transactions between nations, the state of the public credit, &c. Nations in fixing this relative value are chiefly guided by that country which possesses the greatest quantity of specie. If she has as much specie as all the others together, the others regulate theirs by her standard; and this regulation between all the others will nearly agree with the regulation made with this principal nation. The relative abundance or scarcity of specie, in different countries, forms what is called the course of exchange, and this plenty or scarcity, on which the mutability of the course of exchange depends, is not real but relative: *e. g.* when the French have greater occasion for funds in Holland than the Dutch have for funds in France, specie is said to be common in France, and scarce in Holland; and vice versa. For performing the cases of exchange with different countries, see ARITHMETIC.

EXCHANGE, ARBITRATION OF. See ARITHMETIC.

EXCHANGE, COURSE OF. See ARITHMETIC. When the course of exchange rises above par, the country where it rises may be certain, that the balance of trade runs against them. Suppose Britain to import from Hamburg goods to the value of 100,000*l.* at par, and export only to the value of 80,000*l.* In this case, bills on Hamburg, will be scarce in Britain, and consequently will rise in value; and after the 80,000*l.* is paid, bills must be procured from other places at a high rate to pay the remainder, so that perhaps 120,000*l.* may be paid for bills to discharge a debt of 100,000*l.* Though the course of exchange be in a perpetual flux, and rises or falls according to the circumstances of trade; yet the exchanges of London, Holland, Hamburg, and Venice, have hitherto in a great measure regulated those of all other places in Europe.

EXCHANGE, DRY, CAMBIUM SICCU, or USURER'S EXCHANGE, consists in giving money at one place, to be repaid it after a certain time in the same place, with a certain sum over, which is usually more than common interest. The ceremony of a real exchange is observed in this fictitious kind, which is only a method of borrowing money. The borrower draws a bill of exchange on an imaginary person, perhaps at Amsterdam, at the price the exchange then goes at, and delivers it to the lender. After the time fixed, a protest comes from Amsterdam for non-payment, with the re-exchange of the money from thence to London; all which, with costs, besides a deduction perhaps at the making of the bargain, the borrower must pay.

EXCHANGE, PAR OF. See ARITHMETIC. When money of the same standard and weight in one country, yields money of the same standard and weight in another, the exchange is then said to be at par. Thus in the year 1744, the par between France and Holland was nearly at 54 gros to the French crown of three livres; when the exchange is above 54 gros, the French say it is high; when below 54 gros, it is low. When the exchange is below par between one country and another, the former loses as debtor and buyer, and gains as creditor and seller. Thus if France owes Holland a certain number of gros, the more of these there are in a crown, the more crowns she has to pay; and as there must be the same number of gros to buy the same quantity of merchandise, while the exchange is low, every French crown is worth fewer gros. On the contrary, if France is creditor for a certain number

of gros, the less of them there are in a crown, the more crowns she will receive; and if France sells her merchandise in Holland for a certain number of gros, the more crowns will she receive, in proportion as each crown contains fewer of these gros. The same reasoning will apply, mutatis mutandis, to the commercial intercourse of other countries, and to any par of exchange. A merchant may send his stock into a foreign country, when the exchange is below par, without injuring his fortune; because, when it returns, he recovers what he had lost; but a prince, who sends only specie into a foreign country, which can never return, is always a loser. The par of exchange between Great Britain and the principal places in Europe, with which, in time of peace, we have any commercial intercourse, is as follows:

PAR, IN STERLING		L. s. d.	
Amsterdam	1 rixdollar	=	0 4 6½
Antwerp	1 ducat	=	0 9 3
Augsburgh	1 florin	=	0 3 1½
Berlin	1 rixdollar	=	0 4 0

Venice	1 ducat	=	0 4 2½
Vienna	1 rixdollar	=	0 4 8

EXCHANGE, REAL, is used for the profit which a merchant, negotiant, or broker, makes of a sum of money received, and for which a bill of exchange is drawn, payable in some other place, and by some other person, for the interest of his money, and the reward of his negotiation. This profit is exceedingly various; being sometimes two, sometimes three, four, or even ten and fifteen per cent, according as the alloy of the species differs, or as money

money is more or less plentiful, or bills of exchange more or less scarce, in the places. This kind is sometimes called mercantile or mixed exchange.

EXCHANGE, SMALL, is used to denote the profit allowed for exchanging one species of money for another. This is also called natural or pure exchange, &c.

EXCHANGE WITH AMERICA, FRANCE, GERMANY, HOLLAND, &c. See **ARITHMETIC**.

EXCHEQUER, in the British jurisprudence, an ancient court of record, in which all causes concerning the revenues and rights of the crown are heard and determined. It took this name from the cloth that covered the table of the court, which was party-coloured, or chequered. It is said to have been erected by William the Conqueror, its model being taken from a like court established in Normandy long before that time. Anciently its authority was so great, that it was held in the king's palace, and its acts were not to be examined or controlled in any other of the king's courts; but, at present, it is the last of the four courts at Westminster. In the exchequer, some reckon seven courts, viz. those of pleas, accounts, receipts, exchequer chamber (which is an assembly of all the judges on difficult matters in law,) errors in the exchequer, errors in the king's bench, and, lastly, the court of equity in the exchequer. But the exchequer, for the dispatch of business, is generally divided into two parts. Officers of the receipt may take one penny in the pound, as their fee for sums issued out: and they are obliged, without delay, to receive the money brought thither; and the money received is to be put into chests under three different locks and keys, kept by three several officers. All sheriffs, bailiffs, &c. are to account in the exchequer; and in the lower part, termed the receipt, the debtors of the king, and persons in debt to them, the king's tenants, and the officers and ministers of the court, are privileged to sue one another, or any stranger, and to be sued in the like actions as are brought in the courts of king's bench and common pleas. The judicial part of the exchequer is a court both of law and equity. The court of law is held in the office of pleas, according to the course of common law, before the barons: in this court, the plaintiff ought to be a debtor or accountant to the king; and the leading process is either a writ of subpoena, or quo minus, which last goes into Wales, where no process out of courts of law ought to run, except a *capias utlagatum*. The court of equity is held in the exchequer chamber before the treasurer, chancellor, and barons; but, generally, before the barons only: the lord chief baron being the chief judge to hear and determine all causes. The proceedings in this part of the exchequer are by the English bill and answer, according to the practice of the court of chancery; with this difference, that the plaintiff here must set forth, that he is a debtor to the king, whether he is so or not. It is in this court of equity that the clergy exhibit bills for the recovery of their tithes, &c. Here too the attorney-general exhibits bills for any matters concerning the crown; and a bill may be exhibited against the king's attorney by any person aggrieved in any cause prosecuted against him on behalf of the king; to be relieved therein: in which case, the plaintiff is to attend on the attorney general, with a copy of the bill; and procure him to give an answer thereto; in the making of which he may call in any person interested in the cause, or any officer, or others, to instruct him, that the king be not prejudiced thereby, and his answer is to be put in without oath. Besides the business relating to debtors, farmers, receivers, accountants, &c. all penal punishments, intrusions, and forfeitures upon popular actions, are matters likewise cognizable by this court; where there also sits a puisne baron, who administers the oaths to high sheriffs, bailiffs, auditors, receivers, collectors, surveyors, and searchers of all the customs, &c. The court of exchequer in Scotland has the same privileges and jurisdiction as that of England; and all matters competent to the one are competent to the other.

EXCHEQUER BILLS. Bills or tickets issued by the Exchequer, payable out of the produce of a particular tax, are generally out of the supplies granted for the year, and receivable in all payments to the exchequer. The first bills of this kind were issued in 1697, as a more convenient kind of security than the tallies and orders for repayment then in use, and were partly intended to supply the want of money during the recoinage then undertaken. With this view, of late years the total amount of outstanding Exchequer bills (exclusive of those charged on specific branches of the revenue)

has usually been about twelve millions. The interest payable on them has been at various rates according to the current rate of interest at the time they were issued. The daily transactions between the bank and the exchequer are chiefly carried on by bills of 1000l. each, which are deposited by the bank in the exchequer to the amount of the sums received by them on government account; the bank-notes and cash thus received by the bank being retained by them, as the detail part of the money-concerns of government is all transacted at the bank. The instalments on loans are paid into the receipt of the exchequer by these exchequer-bills of 1000l. each, which are received again by the bank as cash, either for the amount of dividends due, or in re-payments of advances; and as, while deposited in the exchequer, they are considered merely as a pledge or security, they of course continue to bear interest, till the advance on which the bank first received them is paid off. Exchequer-bills, though the same in their nature and solidity, differ in their origin from navy-bills in this, that they are issued in anticipation of revenue, and circulated by the bank of England to raise money. During the recess of parliament, there is a sum left to the credit of the chancellor of the exchequer, to serve in cases of exigency. The bank makes advances to the amount voted, for which the exchequer issues bills. There is a standing contract between government and the bank for the trouble and expence attending the issue and circulation of these bills. Notice is given by public advertisement, and the payment is made at the exchequer-bill office Westminster.

EXCHEQUER, BLACK BOOK OF THE, an ancient statistical work under the keeping of the two chamberlains of the exchequer; said to have been composed, in 1175, by Gervais of Tilbury, nephew of king Henry II. and divided into several chapters. Herein is contained a description of the court of England, as it then stood, its officers, their rank, privileges, wages, perquisites, power, and jurisdiction; and the revenues of the crown, in money, grain, and cattle. Here we find, that for one shilling, as much bread might be bought as would serve 100 men a whole day; that the price of a fat bullock was only 12s. and of a sheep 4s. &c.

EXCHEQUER, CHANCELLOR OF THE. See **CHANCELLOR**.
EXCISE, [from the Belgic *accusae*, tribute;] an inland duty or imposition, paid sometimes upon the consumption of the commodity, or frequently upon the wholesale, which is the last stage before the consumption. This is doubtless the most economical way of taxing the subject; the charges of levying, collecting, and managing, the excise duties, being considerably less in proportion than in other branches of the revenue. It also renders the commodity cheaper to the consumer, than charging it with customs to the same amount would do, because generally paid in a much later stage of it. But, at the same time, the rigour and arbitrary proceedings of excise laws seem hardly compatible with the temper of a free nation. For the frauds that might be committed in this branch of the revenue, unless a strict watch be kept, make it necessary, wherever it is established, to give the officers a power of entering and searching the houses as deal in exciseable commodities, at any hour of the day, and even, in many cases, of the night. And the proceedings, in case of transgressions, are so summary and sudden, that a man may be convicted in two days time in the penalty of many thousand pounds, by two commissioners of justices of the peace: to the total exclusion of the trial by jury, and disregard of the common law. For which reason, though lord Clarendon tells us, that to his knowledge the earl of Bedford (who was made lord treasurer by king Charles I. to oblige his parliament) intended to have set up the excise in England, yet it never made a part of that unfortunate prince's revenue; being first introduced, on the model of the Dutch prototype, by the parliament itself after its rupture with the crown. Yet such was the opinion of its general unpopularity, that when in 1642 "aspersions were cast by malignant persons upon the house of commons, that they intended to introduce excises, the house for its vindication therein did declare, that these rumours were false and scandalous, and that their authors should be apprehended and brought to condign punishment." Its original establishment was in 1643; and its progress was gradual; being at first laid upon those persons and commodities where it was supposed the hardship would be least perceivable, viz. the makers and venders of beer, ale, cyder, and perry; and the royalists at Oxford soon followed the example of their brethren at Westminster, by imposing a similar duty: both sides protesting, that it should

should be continued no longer than to the end of the war, and then be utterly abolished. But the parliament at Westminster soon after imposed it on flesh, wine, tobacco, sugar, and such a multitude of other commodities, that it might be fairly denominated general: in pursuance of the plan laid down by Mr. Pymme (who seems to have been the father of the excise,) in his letter to Sir John Hotham, signifying, "that they had proceeded in the excise to many particulars, and intended to go on farther; but that it would be necessary to use the people to it by little and little." And afterwards, when the nation had been accustomed to it for a series of years, the succeeding champions of liberty boldly and openly declared "the impost of excise to be the most easy and indifferent levy that could be laid upon the people;" and accordingly continued it during the whole usurpation. Upon king Charles II's return, it having then been long established, and its produce well known, some part of it was given to the crown, (in 12 Car. II.) by way of purchase for the feudal tenures and other oppressive parts of the hereditary revenue. Various additions to the original duties were made at subsequent periods, and the excise being extended to candles, soap, starch, hides, and other articles, it became one of the most productive branches of the public revenue; the gross produce, in the year 1732, being 2,964,617l. About this time Sir Robert Walpole, who was of opinion that taxes on consumable commodities, to which every citizen contributes in proportion to his consumption, and which being included in the price of the commodity are insensibly paid, constituted the most eligible mode of raising the revenue necessary for the public service; formed a project for the gradual abolition not only of the taxes on land, houses, and windows, but likewise the customs, by the substitution of productive excise duties. He was influenced in the formation of this scheme by a knowledge of the gross and shameless frauds then daily practised in the collection of the customs; and which, from the very nature of those frauds, and the extreme facility of committing them, he had no hope to remedy: he thought, therefore, that to convert the greater part of the customs into duties of excise, would be equally advantageous to government and to the fair trader; and that the excise laws might be so ameliorated that, notwithstanding the odium generally attached to them as oppressive and arbitrary, no just ground of complaint should remain. With a view, therefore, to the execution of this plan, he obtained a revival of the salt duties, which had been repealed some years before; but upon proposing, in the following year, to transfer the duties on wine and tobacco to the excise, so much clamour was raised against the measure that the minister, after some perseverance, thought it prudent to relinquish this favourite project. The defeat of this scheme was celebrated by general rejoicings, as a deliverance from the greatest political danger: had it succeeded, between four and five millions a year would have been raised under the excise system, in addition to the excise duties then subsisting. The various additional duties which at different times have been imposed, and which the progress of the public expenditure has rendered necessary, have greatly increased the produce of the excise, and rendered it the most important branch of the public revenue, which now amounts to more than twenty millions annually. The duties which it comprehends are divided into the permanent consolidated duties, the temporary war taxes, and the annual duties; the latter consists of the old annual malt duty, and of an additional malt-duty, which with some duties on tobacco and snuff, and some custom duties, have, since the project for selling the land-tax, been granted annually in lieu thereof.

Excise Laws. For more easily levying the revenue of the excise, the kingdom of England and Wales is divided into about fifty collections, some of which are called by the names of particular counties, others by the names of great towns; where one county is divided into several collections, or where a collection comprehends the contiguous parts of several counties, every such collection is subdivided into several districts, within which there is a supervisor; and each district is again subdivided into outrides and footwalks, within each of which there is a gauger or surveying officer. The commissioners or sub-commissioners, in their respective circuits and divisions, shall constitute, under their hands and seals, so many gaugers as they shall find needful.

Arrears of duties. By several acts of parliament, all articles in the possession of persons subject to the excise laws, together with all the materials and utensils of whatsoever description, are made

liable for the arrears of duties, whether these be single or double duties; and if a trader, being in arrears for the single duties, becomes a bankrupt, and is convicted after the assignment of his effects, the double duties are a lien upon the exciseable commodities, utensils, and materials, in the hands of his assignees, and the commissioners or magistrates, may authorize the penalty to be levied upon all such commodities, and all the materials, preparations, utensils, and vessels for making thereof, in the custody of the bankrupt, or any person or persons in trust for him: 2 Doug. 411.

Bonds, for the exportation of exciseable commodities, are to be taken by officers of excise, and they are to be given generally upon all exciseable articles, at the place where exported.

Forgery of any stamps, licences, certificates, permits, or any other excise documents, is by various statutes made a capital felony.

Licences. In all cases where licenses are required, the licence will only sanction the business carried on in that particular place for which such licence was granted; but when the business is carried on by partners, one licence will be sufficient to cover the firm.

Officers of Excise. The officers of excise are to be appointed, and may be dismissed, replaced, or altered, by the commissioners, under their hands and seals; their salaries are allowed and established by the treasury; and by 1 W. & M. c. 24. s. 15, if it is proved by two witnesses, that any officer has demanded or taken any money, or other reward whatever, except of the king, such offender shall forfeit his office. By several statutes, no process can be sued out against any officer of excise, for any act done in the execution of his office, until one month after notice given, specifying the cause of action, and the name and abode of the person who is to begin, and the attorney who is to conduct the action; and within one month after such notice, the officer may tender amends, and plead such tender in bar; and having tendered insufficient or no amends, he may, with leave of the court, before issue joined, pay money into court. Officers of excise are empowered to search, at all times of the day, enter warehouses, or places for tea, coffee, &c. But private houses can only be searched upon oath of the suspicion: before a commissioner or justice of peace, who can by their warrant authorise a search.

Permits. Persons dealing in exciseable commodities are entitled to permits for removing the same to different places in certain quantities, and under certain regulations. These permits are written upon a peculiar species of paper, manufactured expressly for the purpose; and by 23 Geo. III. c. 70. s. 11, no permit paper is to be delivered out before it shall be filled up agreeably to the request note of a trader; and officers knowingly granting any false permit, making false entries in the counterpart thereof, or receiving any commodities into stock with a false or forged permit, are to be transported for seven years.

Samples. Officers of excise are, by various acts, empowered to take samples of exciseable commodities, paying the prices therein regulated for the same.

Seizures. When an officer makes a seizure of any spirits, or any other articles, he must lay his hand on the casks, vessels, &c. so seized, and declare that he seizes such spirits, &c. and the casks or vessels containing the same, for the use of his majesty and of himself; but if the officer happen to be alone when he makes such seizure, he must afterwards, in the presence of witnesses, again lay his hand upon such cask, vessel, &c. and repeat the same declaration of seizure. All informations on seizures must be laid in the names of the officers making the same. By 41 Geo. III. c. 96, commissioners of excise are empowered to make restitution of exciseable goods.

Scales and Weights. By various acts of parliament, traders subject to the excise laws, are to keep just and sufficient scales and weights, under penalty of 100l. for every such offence, and the scales and weights may be seized by the officer. Traders, manufacturers, and dealers liable to the excise duties, are to assist the officers in weighing stock; and forcibly obstructing, or using any art or contrivance to prevent or impede the officers from taking a true account, incurs a penalty of 100l.

EXCISION, in a scripture sense, means the cutting off of a person from his people, by way of punishment for some sin. The Jews, Selden informs us, reckon up thirty-six crimes, to which they pretend this punishment is due.

Excision,

EXCISION, in surgery, the cutting out, or off, any part of the body.

EXCITABILITY, [*incitabilitas*, Lat.] a term literally signifying a capability of being excited; first used by the late Dr. Brown, to express that quality, substance, property, or principal, on which the phenomena of life depend. See **BRUNONIAN SYSTEM**. "We know not," says the Doctor, "what excitability is, or in what manner it is affected by the exciting powers. But whatever it be, a certain quantity, or energy, (or as Dr. Beddoes expresses it, in the second edition of Brown's Elements,—“a certain portion,”) of it, is assigned to every being upon the commencement of its living state. The quantity, or energy, is different in different animals, and in the same animal at different times.”—“The seat of excitability, in the living body, is medullary nervous matter and muscular solid. The excitability is inherent in it, but not different in different parts of its seat. This fact is proved by the production (or rousing into exertion) of sense, motion, the mental functions, and passions, immediately, instantaneously, and not in a series of successive operations. Different exciting powers are applied to different parts of the nervous system, none to them all at once; but wherever they are applied, every one immediately affects the whole excitability.” Elem. Med. XVIII. XLVIII. first edition.

EXCITABILITY, ACCUMULATED, INCREASED, or SUPERABUNDANT, is that state of the excitability, which is produced by withholding, or withdrawing the usual stimuli for some time, and hence inducing direct debility. Dr. Brown mentions as a familiar instance of it, “that debility which dram-drinkers experience the day after debauch, in consequence of which their hands shake till they are re-excited by their favourite cordial.” Elem. Med. XLIII. Note n.

EXCITABILITY, DEFICIENT, EXHAUSTED, or WORN-OUT, is the opposite of the accumulated, being that state which is produced by too long continued or excessive application of the exciting powers. Dr. Brown mentions as “an instance of it, that debility which arises from intoxication;” elsewhere styled indirect debility. Elem. Med. XLIII. Note n.

EXCITATION, in electricity. See **ELECTRICITY**.

EXCITEMENT, [*incitatio*, Lat.] in Dr. Brown's System of Medicine, “the effect of the exciting powers acting upon the excitability,” Elem. Med. XVI. “The excitement,” says Dr. Beddoes, “may be too great, too small, or in just measure. By too great excitement weakness is induced, because the excitability becomes defective; this is indirect debility: when the exciting powers or stimulants are withheld, weakness is induced; and this is direct debility. Every power that acts on the living frame produces excitement by expending excitability.” Elem. Med. 2d edit. p. cxxvii.

EXCLUSION, or BILL OF EXCLUSION, a bill proposed about the close of the reign of king Charles II. for excluding the duke of York, the king's brother, from the throne, on account of his being a papist.

EXCLUSION, in mathematics, is a method of coming at the solution of numerical problems, by previously throwing out of our consideration such numbers as are of no use in solving the question.

EXCECARIA, a genus of the triandria order, and dicecia class of plants; natural order, Tricoeca. Male amentum, naked; calyx and corolla none; styles three; capsule tricoecous. It has two species.

EXCLAMATION, in rhetoric, a figure that expresses the violent and sudden breaking out, and vehemence of any passion. Such is that in the second book of Milton's Paradise Lost:

O unexpected stroke, worse than of death!

Must I thus leave thee, Paradise? Thus leave

Thee, native soil; these happy walks and shades,

Fit haunt of gods? See **ORATORY**.

EXCOMMUNICATION, an ecclesiastical interdict; exclusion from the fellowship of the church.

EXCOMMUNICATION is founded on a natural right which all societies have, of excluding out of their body such as violate their laws; and it was originally instituted for preserving the purity of the church; but ambitious ecclesiastics converted it by degrees into an engine for promoting their own power, and inflicted it on the most frivolous occasions. The power of excommunication, as well as other acts of ecclesiastical discipline, was lodged in the

hands of the clergy, who distinguished it into the greater or lesser.

EXCOMMUNICATION, THE GREATER, called *πεντης ἀφορισμός*, i. e. total separation and anathema, consisted in an absolute and entire exclusion from the church and the participation of all its rites. When any person was thus excommunicated, notice was given of it by circular letters to the most eminent churches all over the world, that they might all confirm this act of discipline, by refusing to admit the delinquent to their communion. The consequences of this excommunication were very terrible. The excommunicated person was avoided in civil commerce and outward conversation. No one durst receive him into his house, or eat at the same table with him; and when dead, he was denied the solemn rites of burial.

EXCOMMUNICATION, THE LESSER, simply called *ἀφορισμός*, i. e. separation or suspension, consisted in excluding men from the participation of the eucharist, and the prayers of the faithful. But they were not expelled the church; for they had the privilege of being present at the reading of the Scriptures, the sermons, and the prayers of the catechumens and penitents. This excommunication was inflicted for less crimes; such as neglecting to attend the service of the church, misbehaviour in it, and the like.

EXCOMMUNICATION AMONG THE HEATHEN. A seclusion from religious rites was also in use under paganism. Such as were excommunicated were forbidden to assist or attend at the sacrifices, or to enter within the temples; and were afterwards delivered over to the demons and furies of hell, with certain imprecations; which was called among the Romans *diris devovere*. See **EXECRATION**. The Druids among the ancient Britons and Gauls, likewise excommunicated rebels, and interdicted the communion of their mysteries to such as refused to acquiesce in their decisions.

EXCOMMUNICATION IN THE CHURCH OF ENGLAND. The form of excommunication in the church of England anciently ran thus: “By the authority of God the Father Almighty, the Son, and Holy Ghost, and of Mary the blessed mother of God, we excommunicate, anathematize, and sequester from the pale of holy mother church, &c.” The causes of excommunication in England are, contempt of the bishop's court, heresy, neglect of public worship and the sacraments, incontinency, adultery, simony, &c. It is described to be twofold. The less is an ecclesiastical censure, excluding the party from the participation of the sacraments: the greater proceeds farther, and excludes him not only from these, but from the company of all Christians. But if the judge of any spiritual court excommunicates a man for a cause of which he has not the legal cognizance, the party may have an action against him at common law, and he is also liable to be indicted at the suit of the king. Heavy as the penalty of excommunication is, there are many who would despise the brutum fulmen of mere ecclesiastical censures, especially when pronounced by a petty surrogate in the country, for railing or contumelious words, for non-payment of fees or costs, or other trivial cause. The law, therefore, steps into their aid, and lends a supporting hand to an otherwise tottering authority; imitating herein the policy of the ancient British Druids. By the common law, an excommunicated person is disabled to do any act that is required to be done by one that is *probus et legalis homo*. He cannot serve upon juries; cannot be a witness in any court; and cannot bring an action to recover lands or money due to him. And if, within 40 days after the sentence has been published in the church, the offender does not submit to the sentence of the spiritual court, the bishop may certify such contempt to the king in chancery. Upon which there issues out a writ to the sheriff of the county, called from the bishop's certificate a *significavit*; or from its effect, a writ *de excommunicato capiendo*; and the sheriff shall thereupon take the offender and imprison him in the county jail, till he is reconciled to the church, and such reconciliation certified by the bishop; upon which another writ *de excommunicato deliberando*, issues out of the chancery to release him.

EXCOMMUNICATION IN THE CHURCH OF ROME. The Romish pontifical mentions three kinds of excommunication, viz. 1. The minor, incurred by those who have any correspondence with an excommunicated person. 2. The major, which falls upon those who disobey the commands of the holy see, or refuse to submit to certain points of discipline, in consequence of which they are excluded

cluded from the church militant and triumphant, and delivered over to the devil and his angels. 3. Anathema, which is properly that pronounced by the pope against heretical princes and countries. In former ages, these papal fulminations were most terrible things; but at present they are formidable to few or none.

EXCORIATION, in medicine and surgery, the galling, or rubbing off of the cuticle, especially of the parts between the thighs and about the anus. In adults, it is occasioned by riding, much walking, or other vehement exercise, and may be cured by vulnerary applications. In children there is often an excoriation, not only of the parts near the pudenda, chiefly of the groin and scrotum, but likewise in the wrinkles of the neck and under the arms: proceeding from the acrimony of urine and sweat; and occasioning itching pains, crying, restlessness, &c. The parts affected should be often washed with warm water, and sprinkled with drying powders, as chalk, or hartshorn, but especially tutty, or lapis calaminaris, which may be tied loosely in a rag, and the powder shaken out on the parts; but ceruse, which some nurses use in this way, is very dangerous.

EXCREMENTS, are the fibrous parts of the aliments, mixed with the bile, saliva, and other fluids. Urine and the faeces are the gross excrements that are discharged out of the bladder and belly. Sweat, or the matter perspired by the pores, in consequence of heat or violent exercise, may also be considered as excrementitious. But we cannot agree with those who consider as excrements, those secretions from the blood, which answer very important ends in the animal economy; such as the saliva, bile, pancreatic juice, lymph, and semen. Nay even the nails, hair, horns, and hoofs, of animals, have been considered by some as excrementitious parts. But these are much more properly stiled by others excrescences. As to the fluid secretions above-mentioned, there is this evident distinction between them and the excrements of the body, that the former are of the highest utility, while the latter are expelled as no longer capable of rendering the animal any service, but on the contrary, if long retained, would prove injurious. See **FÆCES**.

EXCRESCENCE, in surgery, a preternatural tumour upon the skin, either in the form of a wart or tubercle. If they are born with a person, as they frequently are, they are called *nævi materni*, or marks from the mother; but if the tumour is large, so as to depend from the skin, like a fleshy mass, it is then called a sarcoma. See **SURGERY**.

EXCRETION, or **SECRETION**, in physiology, a separation of some fluid from the blood by means of the glands. See **PHYSIOLOGY**.

EXCRETORY DUCTS, in anatomy, a term applied to certain little vessels, destined for the reception of a fluid, secreted in certain glandules, and other viscera, for the excretion of it in the appropriated places.

EXCUBILE, in antiquity, the watches and guards kept in the day by the Roman soldiers, contradistinguished from the *vigilæ* which were kept in the night.

EXCULPATION, **LETTERS OF**, in Scots law, a writ or summons issued by authority of the court of justiciary, at the instance of a pannel, for citing witnesses to prove his defences, or his objections to any of the jury or witnesses cited against him.

EXCUSATI, in church history, slaves, who flying to any church for sanctuary, were excused and pardoned by their masters; but these were obliged to take an oath to that purpose before they could have them again; and, if they broke the oath, they were punished and fined as persons guilty of perjury.

EXECRATION, in antiquity, a kind of punishment, consisting of direful curses and marks of infamy: such was that used against Philip of Macedon by the Athenians. A general assembly of the people being called, they made a decree, that all the statues and images of that king, and of all his ancestors, should be demolished, and their very name razed; that all the festivals, sacred rites, priests, and whatever else had been instituted in honour of him, should be profaned; that the very places where there had been any monument or inscription to his honour, should be detestable; that nothing should be set up, or dedicated in them, which could be done in clean places; and, lastly, that the priests, as often as they prayed for the Athenian people, allies, armies, and fleets, should as many times detest and execrate Philip, his children, kingdom, land and sea forces, and the whole race and name of the Macedonians. At the taking and demolishing of cities, it was

usual amongst the Jews, Greeks, and Romans, to pronounce curse upon, and load with direful execrations, the rebuilders of them.

EXECUTION, in a general sense, the act of accomplishing, finishing, or achieving, any thing to be done.

EXECUTION, in law, the completing or finishing of some act, as of judgement, deed, &c. and it usually signifies the obtaining of possession of any thing recovered by judgement of law. Sir Edward Coke observes, that there are two sorts of executions; the one final; and the other a quousque, that tends to an end. An execution final, is that which makes money of the defendant's goods; or extends to his lands, and delivers them to the plaintiff, who accepts the same in satisfaction; and this is the end of the suit, and the whole that the king's writ requires to be done. The writ of execution with a quousque, though it tends to an end, yet is not final, as in the case of a *capias ad satisfac.* where the defendant's body is to be taken, in order that the plaintiff may be satisfied for his debt. Executions are either in personal, real, or mixed actions. In a personal action, the execution may be made three ways, viz. by the writ of *capias ad satisfaciendum*, against the body of the defendant; *fieri facias*, against his goods; or *eligit*, against his lands. See **ELIGIT**, and **FIERI FACIAS**. In a real and mixed action, the execution is by writ of *habere facias sasinam*, and *habere possessionem*. See **HABERE**. Writs of execution bind the property of goods only from the time of delivery of the writ to the sheriff; but the land is bound from the day of the judgement obtained: and here the sale of any goods for valuable consideration, after a judgement, and before the execution awarded, will be good. It is otherwise as to lands, of which execution may be made, even on a purchase after the judgement, though the defendant sell such land before execution. Likewise, sheriffs may deliver in execution all the lands whereof others shall be seised in trust for him, against whom execution is had on a judgement, &c. When any judgement is signed, the execution may be taken out immediately thereon; but if it be not issued within a year and a day after, where there is no fault in the defendant, as in the case of an injunction, writ of error, &c. there must be a *scire facias*, to revive the judgement; though, if the plaintiff sues out any writ of execution within the year, he may continue it after the year is expired. After judgement against the defendant, in an action wherein special bail is given, the plaintiff is at liberty to have execution against such defendant, or against his bail: but this is understood where the defendant does not render himself, according to law, in safeguard of the bail; and execution may not regularly be sued forth against a bail, till a default is returned against the principal: also if the plaintiff take the bail, he shall never take the principal. It is held that an execution may be executed after the death of the defendant: for his executor, being privy thereto, is liable as well as the testator. The execution is an entire thing, so that he who begins must end it: therefore, a new sheriff may distrain an old one, to sell the goods seized on a distringas, and to bring the money into court.

EXECUTION OF CRIMINALS, must be according to the judgement; and the king cannot alter a judgement from hanging to beheading, because no execution can be warranted, unless it be pursuant to the judgement. This, being the completion of human punishment, in all cases, as well capital as otherwise, must be performed by the legal officer, the sheriff, or his deputy. Murderers are to be executed the day next but one after conviction, unless it be Sunday, and anatomised; for which reason they are generally tried on a Friday.

EXECUTION, in music, a term applicable to every species of musical performance; but more particularly used to express a facility of voice or finger in running rapid divisions, and other difficult and intricate passages: it includes, in a general sense, taste, feeling, grace, and expression.

EXECUTOR, is a person appointed by the testator, to carry into execution his will and testament after his decease. The regular mode of appointing an executor, is by naming him expressly in the will; but any words indicating an intention of the testator to appoint an executor will be deemed a sufficient appointment. Any person capable of making a will, is also capable of being an executor: but in some cases, persons who are incapable of making a will, may nevertheless act as executors, as infants, or married women; to obviate, however, inconveniences which have occurred respecting the former, it is enacted by stat. 38 Geo. III. c. 89, that where an infant is sole executor, administration, with the

will annexed, shall be granted to the guardian of such infant, or such other person as the spiritual court shall think fit, until such infant shall have attained the age of twenty-one; when, and not before, probate of the will shall be granted him. An executor derives his authority from the will and not from the probate, and is therefore authorized to do many acts in execution of the will, even before it is proved, such as the releasing, paying, or receiving of debts, assenting to licences, &c. but he cannot proceed until he has obtained probate. If an executor die before probate, administration must be taken out with the will annexed; but if an executor die, his executor will be executor to the first testator, and no fresh probate will be needed. It will be sufficient if one only of the executors prove the will; but if all refuse to prove, they cannot afterwards administer, or in any respect act as executors. If an executor become a bankrupt, the court of chancery will appoint a receiver of the testator's effects, as it will also upon the application of a creditor, if he appear to be wasting the assets. If an executor once administers, he cannot afterwards renounce; and the ordinary may in such case issue process to compel him to prove the will. 1 Mod. 213. If an executor refuse to take upon him the execution of the will, he shall lose the legacy therein contained. If a creditor constitute his debtor his executor, this is at law a discharge of the debt, whether the executor acts or not, provided, however, there be assets sufficient to discharge the debts of the testator. The first duty of an executor or administrator is to bury the deceased in a suitable manner; and if the executor exceed what is necessary in this respect, it will be a waste of the substance of the testator. The next thing to be done by the executor is to prove the will, which may be done either in the common form, by taking the oath to make due distribution, &c. or in a more solemn mode, by witnesses to its execution. By stat. 37 Geo. III. c. 9. s. 10, every person who shall administer the personal estate of any person dying without proving the will of the deceased, or taking out letters of administration within six calendar months after such person's decease, shall forfeit 50*l*. Upon proving the will, the original is to be deposited in the registry of the ordinary, by whom a copy is made upon parchment under his seal, and delivered to the executor or administrator, together with a certificate of its having been proved before him, and this is termed the probate. If all the goods of the deceased lie within the same jurisdiction, the probate is to be made before the ordinary or bishop of the diocese, where the deceased resided; but if he had goods and chattels to the value of 5*l*. in two distinct dioceses or jurisdictions, the will may be proved before the metropolitan or archbishop of the province in which the deceased died. An executor, by virtue of the will of the testator, has an interest in all the goods and chattels, whether real or personal, in possession or in action of the deceased; and all goods and effects coming to his hands will be the assets to make him chargeable to creditors and legatees. An executor or administrator stands personally responsible for the due discharge of his duty; if, therefore, the property of the deceased is lost, or through his wilful negligence becomes otherwise irrecoverable, he will be liable to make it good; and also where he retains money in his hands longer than is necessary, he will be chargeable not only with interest but costs, if any have been incurred. But one executor shall not be answerable for money received, or detriment occasioned by the other, unless it has been by some act done between them jointly. An executor or administrator has the same remedy for recovering debts and duties, as the deceased would have had if living. Neither an executor nor administrator can maintain any action, for a personal injury done to the deceased, when such injury is of such a nature for which damages may be received; in actions, however, which have their origin in breach of promise, although the suit may abate by the death of the party, yet it may be revived either by his executors or administrators, who may also sue for rent in arrear, and due to the deceased in his lifetime. By the custom of merchants, an executor or administrator may indorse over a bill of exchange or promissory note. An executor or administrator may also, on the death of a lessee for years, assign over the lease, and shall not be answerable for rent after such assignment; nor shall he be liable for rent due after the lessee's death, from premises which in his life-time he had assigned to another. An executor or administrator is bound only by such covenants in a lease as are said to run with the land. The executor or administrator, previous to the distribution of the property of the deceased,

must take an inventory of all his goods and chattels, which must, if required, be delivered to the ordinary upon oath. He must then collect, with all possible convenience, all the goods and effects contained in such an inventory; and whatever is so recovered that is of a saleable nature, and can be converted into money, is termed assets, and makes him responsible to such amount to the creditors, legatees, and kindred of the deceased. The executor or administrator having collected in the property, is to proceed to discharge the debts of the deceased, which he must do according to the following priorities, otherwise he will be personally responsible. 1. Funeral expences, charges of proving the will, and other expenditures incurred by the execution of his trust. 2. Debts due to the king on record, or by speciality. 3. Debts by particular statutes, as by 30 C. II. c. 23. Forfeitures for not burying in woollen; money due for poor-rates, and money due to the post-office. 4. Debts of record, as judgements, statutes, recognizances, and those recognized by a decree of a court of equity; and debts due on mortgage. 3 Peere Wms, 401. 5. Debts on special contracts, as bonds or other instruments under seal, and also rent in arrear. 6. Debts on simple contract, viz. such as debts arising by mere verbal promise, or by writing not under seal, as notes of hand, servants' wages, &c. The executor is bound at his peril to take notice of debts on record, but not of other special contract, unless he receive notice. If no suit be actually commenced against an executor or administrator, he may pay one creditor in equal degree the whole debt, though there should be insufficient remaining to pay the rest; and even after the commencement of a suit, he may by confessing judgement to other creditors of the same degree, give them a preference. Executors and administrators are also allowed, amongst debts of equal degree, to pay themselves first: but they are not allowed to retain their own debt, to the prejudice of others in a higher degree; neither shall they be permitted to retain their own debts, in preference to that of their co-executor or co-administrator of equal degree; but both shall be charged in equal proportion. A mortgage made by the testator must be discharged by the representative out of the personal estate, if there be sufficient to pay the rest of the creditors and legatees. Where such mortgage, however, was not incurred by the deceased, it is not payable out of the personal estate. See LEGACIES, and ASSETS.

EXECUTOR DE SON TORT, or an executor of his own wrong, a person that takes upon him the office of an executor by intrusion, without being so constituted by the testator, or appointed by the ordinary to administer. Such a person is chargeable to the rightful executor, as also to all the testator's creditors and legatees, so far as the goods amount to, which he wrongfully possessed.

EXECUTORY ESTATE. Estates executory, are when they pass presently to the person to whom conveyed, without any afteract, 2 Inst. 513; and leases for years, rents, annuities, condition, &c. are called inheritances executory. Id. 293.

EXECUTORY DEVISE, is defined a future interest, which cannot vest at the death of a testator, but depends upon some contingency which must happen before it can vest. Abr. Eq. 186. An executory devise differs from a remainder, in three very material points: 1. That it needs not any particular estate to support it. 2. That by it a fee-simple, or other less estate, may be limited after a fee-simple. 3. That hereby a remainder may be limited of a chattel interest, after a particular estate for life created in the same. 2 Black. 172.

EXECUTORY DEVISES OF TERMS FOR YEARS. If a farmer devises his term A for life, the remainder to another, though A have the whole estate, (for that is in him during life,) and so no remainder can be limited over, at common law, yet it is good by way of executory devise. 1 Rol. Abr. 610.

EXEDRÆ, in antiquity, halls with many seats, where the philosophers, rhetoricians, and men of learning, met for discourse and disputation. The word occurs in ecclesiastical writers as a general name for such buildings as were distinct from the main body of the churches, and yet within the limits of the church, taken in its largest sense. Among the exedræ the chief was the Baptistery.

EXEGESIS LINEA, or **NUMEROSA**, [from *ἐξήγησις*, of *ἐξ*, out, and *ἡγήσασθαι*, I lead,] is the lineal or numeral solution or extraction of roots out of the affected equations in algebra.

EXEGESIS, in the Scots universities, is an exercise among the students

students in divinity, in which a question is stated by the respondent, who is then opposed by other students in their turns; during which the professor solves the difficulties which the respondent cannot overcome.

EXEGETES, [from *ἐξηγεῖται*, to explain,] among the Athenians, persons learned in the laws, whom the judges used to consult in capital causes.

EXEGETICA, in algebra, the art of finding, either in numbers or lines, the roots of the equation of a problem, according as the problem is either numerical or geometrical.

EXEMPLAR denotes the image, conceived in the mind of the artist, whereby he conducts his work.

EXEMPLIFICATION OF LETTERS PATENT, denotes a copy made from the enrolment, and sealed with the great seal; which is as effectual to be shewed, or pleaded as the original.

EXEMPTIONS, in law. Peers are exempted from being sworn upon inquests; and knights, clergymen, and others, from appearing at the sheriff's turn. Persons of 70 years of age, surgeons, apothecaries, butchers, &c. are exempted from serving on juries; and justices of the peace, attorneys, &c. from parish offices.

EXERCISE, among physicians, is either active or passive. The active is walking, hunting, dancing, playing at bowls, and the like; as also speaking, and other joint exertions of the body and mind. The passive is riding in a coach or on horseback; sailing, &c. Exercise may be continued to a beginning of weariness, and ought to be used before dinner in a pure light air. Journeys into the country contribute greatly to preserve and re-establish health. Exercise increases the circulation of the blood, attenuates the fluids; promotes a regular perspiration, and a due secretion of all the humours; accelerates the animal spirits; facilitates their distribution into all the fibres of the body; strengthens the parts; creates an appetite, and helps digestion. Boerhaave recommends bodily exercise in diseases of a weak and lax fibre. By riding on horseback, says his commentator, the pendulous viscera of the abdomen are shaken every moment, and gently rubbed one against another, while in the mean time the pure air acts on the lungs with greater force. But a weak man should not ride with a full stomach, but either before dinner, or after the digestion is near finished; for when the stomach is distended, weak people do not bear these concussions. Sailing is also an exercise of great use to weak people. To strengthen the body by muscular motion, running, leaping, and other active exercises, are to be used. In these we should begin with the most gentle, such as walking, and increase it by degrees till we come to running. Those exercises of the body are more especially serviceable which exercise the mind at the same time. The ancients appointed rewards for those who excelled in gymnastic exercises; that the bodies of their youth might thus be hardened for warlike toils. But, though nothing is more conducive to health than moderate exercise, yet violent exercise dissipates the spirits, weakens the body, destroys the elasticity of the fibres, and exhausts the fluid parts of the blood. Great care should therefore be taken, to proportion the degree of exercise to the strength of the patient. Swinging has often been found very beneficial to consumptive and other debilitated persons.

EXERCISE, in military affairs, is the ranging of a body of soldiers in form of battle, and making them perform the several motions and military evolutions with different management of their arms, in order to make them expert therein. See **MANUAL EXERCISE**.

EXERCISE, in the royal navy, is the preparatory practice of managing the artillery and small arms, in order to make the ship's crew perfectly skilled therein, so as to direct its execution successfully in the time of battle. See **NAVY**, and **NAVAL TACTICS**.

EXERCISE may also be applied with propriety to the forming of our fleets into orders of sailing, lines of battle, &c. an art which the French have termed evolutions, or tactics. See **NAVAL TACTICS**.

EXERCISES are also understood of what young gentlemen learn in the academics and riding-schools, such as fencing, drawing, riding the great horse, &c. The delicate springs of our frail machines lose their activity and become enervated, and the vessels are choked by obstructions, when we totally desist from exercise,

and the consequences necessarily affect the brain: a very studious and sedentary life is therefore equally prejudicial to the body and the mind. An inclination to study is highly commendable: but it ought not to inspire us with an aversion to society. The natural lot of man is to live among his fellows: and whatever may be our situation in life, there are a thousand occasions where a man must desire to render himself agreeable.

EXERCITOR, in Scots law, he who employs a ship in trade, whether he be owner, or only freights her from the owner.

EXERGASIA, or **EXPOSITION**. See **ORATORY**.

EXERGUE, or **EXERGUM**, [of *ἐξ*, from, and *ἐργον*, the work,] the circular space between the work and edge of a coin or medal, on which the inscription or motto is usually placed.

EXETER, [*q. d.* Excester, *i. e.* a city upon the Ex,] the capital of Devonshire, anciently called Isex, and Isia Damnoniorum. It is large, populous, and wealthy, with gates, walls, and suburbs; the circumference is about three miles. It is 31 miles N. N. E. of Dartmouth, and 78 S. W. of Bristol.

EXETER, a bishopric of England, comprehending the counties of Cornwall and Devonshire. The bishop's seat was transferred to Exeter, from Crediton, by Edward the Confessor.

EXETER, a town and river of New Hampshire.

EXETER, a town of North Carolina, in New Hanover county, 36 miles N. of Wilmington.

EXFOLIATION, the scaling of a bone, or its rising into thin laminae.

EX GRAVI QUERELA, in law, is a writ, that lies for the person to whom any lands or tenements in fee are devised by will, and the heir of the devisor enters thereon, and detains them from the devisee. Also, where a person devises such lands to another in tail with the remainder over in fee: here if the tenant in tail enter, and is seised by force of the entail, and afterwards he dies without issue, the person in remainder, or reversion, may bring this writ to execute the devise.

EXHALATION and **EVAPORATION** are often used synonymously, but accurate writers distinguish them, appropriating the latter to the raising of moist fumes from liquid bodies, and the former to the emission of dry effluvia from solid bodies, as earth, fire, minerals, &c. In this sense, exhalations are dry and subtle corpuscles, loosened from hard terrestrial bodies, either by the heat of the sun, the action of the air, or some other cause; and emitted upwards to a certain height in the atmosphere, where, mixing with the vapours, they help to form clouds, and return back in rain, mist, &c.

EXHAUSTED RECEIVER, in pneumatics, a glass or other vessel, applied on the plate of an air-pump, where the air is extracted out of it by the working of the pump. Things placed in it are said to be in vacuo. See **PNEUMATICS**.

EXHAUSTIONS, in mathematics, or the method of exhaustions, is a way of proving the equality of two magnitudes, by a *reductio ad absurdum*; shewing, that if one be supposed either greater or less than the other, there will arise a contradiction. It is founded upon the exhausting of a quantity by continually taking away certain parts of it. This method was of frequent use among the ancient mathematicians; as Euclid, Archimedes, &c. It is founded on what Euclid says in his 10th book; viz. that those quantities whose difference is less than any assignable quantity, are equal; for if they were unequal, be the difference ever so small, yet it may be so multiplied, as to become greater than either of them; if not so, then it is really nothing. This he assumes in the proof of prop. 1. book x. which imports, that if, from the greater of two quantities, be taken more than its half, and from the remainder more than its half, and so continually, there will, at length, remain a quantity less than either of those proposed. Thus: two quantities, A and B, are equal, when, if to or from one of them, as A, any other quantity, as d, be subtracted, however small it be, then the sum or difference is respectively greater or less than the other quantity B, viz. d being an indefinitely small quantity.

if $A + d$ be greater than B,

and $A - d$ less than B,

then is A equal to B.

On this foundation it is demonstrated, that if a regular polygon of infinite sides be inscribed in, or circumscribed about, a circle; the space, which is the difference between the circle and the polygon, will,

will, by degrees, be quite exhausted, and the circle become equal to the polygon. See Archimed. de Dimens. Circuli; Wallis's Algebra, Ch. 73; and Ronayne's Alg. part 3, p. 395. Upon the method of exhaustions depends the method of indivisibles introduced by Cavalieri, which is but a shorter way of expressing the method of exhaustions; as also Wallis's Arithmetic of Infinites, which is a farther improvement of the method of indivisibles; and hence also the methods of increments, differentials, fluxions, and infinite series.

EXHEREDATION, in the civil law, with us ordinarily called disinheriting, is the father's act of excluding his son from inheriting his estate.

EXHIBIT, in law, is where a deed, or other writing, being produced in a chancery suit to be proved by witnesses, the commissioner, appointed for the examination, certifies on the back of the writing, that it was shewn to the witness at his examination, and by him sworn to.

EXHIBITION, a benefaction settled for the benefit of scholars in the universities, that are not on the foundation.

EXHIBITION, in law, a production of titles, and other proofs of a matter in contest.

EXHORTATION, in rhetoric, differs only from Suasion, in that the latter principally endeavours to convince the understanding, and the former to work on the affections.

EXHUMATION, [from *ex*, out of, and *humus*, ground,] the act of digging up a body interred in holy ground, by the authority of the judge.

EXIDEUIL, a town of France, in the department of Dordogne; 30 miles S. of Limoges.

EXIGENT, in law, a writ which lies where the defendant in a personal action cannot be found, nor any effects of his within the county, by which he may be attached or distrained.

EXIGENTERS, four officers in the court of common pleas, who make all exigents and proclamations in actions where process of outlawry lies.

EXILE. See **BANISHMENT**. Among the Romans *exilium* properly signifies an interdiction or exclusion from water or fire; the necessary consequence of which was, that the interdicted person must betake himself into some other country, since there was no living without fire and water. Thus Cicero, ad Herenn. observes that the form of the sentence did not express *exilium*, but only *aqua et ignis interdictio*: and that "exile was not properly a punishment, but a voluntary flying and avoiding the punishment decreed."

EXILES, or **EXILLES**, a town and fort of Piedmont, seated on the Doria, 5 miles W. S. W. of Suza, and 40 N. E. of Embrun.

EXILIUM. See **EXILE**.

EXISTENCE, that whereby any thing has an actual essence, or is said to be. See **ESSENCE**.

EXITERIA, in antiquity, oblations or prayers to the gods for a prosperous journey: also feasts celebrated by the Greeks with sacrifices, when their generals undertook expeditions against an enemy.

EXLUNZA, a town of Spain, 5 miles S. of Leon.

EXMOUTH, a sea-port on the S. coast of Devonshire, at the mouth of the Ex, 10 miles S. of Exeter.

EXOACANTHA, a genus of the class and order pentandria digynia. Involucrum spiny. Flowers all hermaphrodite, with equal inflexions; seeds ovate, striated. There is one species.

EXOCETUS, or the **FLYING FISH**, in ichthyology, a genus of the order abdominales. Head scaly; teeth none; jaws connected on each side; gill membrane, ten-rayed; pectoral fins very long and large, and giving, to a certain degree, the power of flight. There are three species. The *E. exillens*, or the Mediterranean flying-fish, is about fourteen inches long, and is found principally in the Mediterranean and Atlantic Seas, frequently alone, and sometimes in small companies. By the extraordinary length of its pectoral fins it is enabled to quit the water, and support a flight, about three feet above the surface, for the distance of eighty or a hundred yards, after which it is obliged to return to the water and moisten its fins, which, even in this short progress, become hard and dry. See Plate LV.

EXODIARY, in the ancient Roman tragedy, the person who, after the play was ended, sung the Exodium.

EXODIUM, in the ancient Greek drama, one of the four divisions of tragedy; the part that included the catastrophe and unravelling of the plot; answering nearly to our fourth and fifth acts.

EXODIUM, among the Romans, consisted of certain humorous verses rehearsed by the exodiary at the end of the *Fabulae Atellanæ*.

EXODIUM, in the Septuagint, signifies the end or conclusion of a feast. It is particularly used for the 8th day of the feast of tabernacles, which, it is said, had a special view to the commemoration of the exodus or departure out of Egypt.

EXODUS, or **EXODY**, [ἐξὸς,] departure; journey from a place: the second book of Moses is so called, because it describes the journey of the Israelites from Egypt.

EXOMPHALOS, [ἐξ and ὀμφαλός,] a navel rupture. See **HERNIA** and **SURGERY**.

EXORCISM, [ἐξορκισμός,] the form of adjuration, or religious ceremony by which evil and malignant spirits are driven away.

EXORCISM means also the power of expelling devils from persons possessed. The Jews made great pretences to this power. Josephus tells several wonderful tales of the great success of several exorcists.

EXORDIUM, in rhetoric, is the preamble or beginning, serving to prepare the audience for the rest of the discourse. Exordiums are of two kinds, either just and formal, or vehement and abrupt. The last are most suitable on occasions of extraordinary joy, indignation, or the like. All exordiums should be composed with a view to captivate the good will, or attract the attention of the audience. The first may be done by paying them some compliment: thus St. Paul, "I think myself happy, king Agrippa, because I shall answer for myself this day before thee, touching all the things whereof I am accused of the Jews, especially because I know thee to be expert in all customs and questions which are among the Jews." See **ORATORY**.

EXOSTOSIS, [ἐξ and ὄστος,] any protuberance of a bone that is not natural, as often happens in venereal cases.—Quincy.

EXOTERIC and **ESOTERIC**, terms denoting external and internal, applied to the double doctrine of the ancient philosophers; the former public, the latter secret. The exoteric was that which they openly professed and taught to the world; the esoteric was confined to a small number of chosen disciples. This method was derived originally from the Egyptians; who according to Herodotus, Diodorus Siculus, Strabo, Plutarch, &c. had a twofold philosophy, one secret and sacred; the other public and common. The same practice also obtained among the Persian Magi, the Druids of the Gauls, and the Brachmans of India.

EXOTIC, [ἐξωτικός,] an appellation denoting a thing to be the produce of foreign countries. Exotic plants of the hot climates are very numerous, and require the utmost attention of the gardener to make them thrive with us. The best method of packing exotic plants for a voyage, especially if they be such as will perish above ground, is to set their roots as closely as possible in wooden boxes, filled with proper soil, and provided with handles: this operation may be performed three weeks before they are shipped. During fair weather, they should be exposed upon the deck, but in wet or unfavourable seasons, they ought to be removed, or covered with a tarpawlin. If exotics be conveyed to a colder climate, they require very little moisture; but, if they are sent from a cold to a warmer country, it will be necessary to water them liberally.

EXPANSION, among metaphysicians, denotes the idea we have of lasting distance, all whose parts exist together.

EXPANSION, as generally employed in science, denotes an increase of the bulk of any body by a power acting from within. It may be laid down as a general rule, to which there is no known exception, that every addition or abstraction of caloric makes a corresponding change in the bulk of the body which has been subjected to this alteration in the quantity of its heat. In general, the addition of heat increases the bulk of a body, and the abstraction of it diminishes its bulk; but this is not uniformly the case, though the exceptions are not numerous. Indeed these exceptions are not only confined to a very small number of bodies, but even in them they do not hold, except at certain particular temperatures, while at all other temperatures these bodies are increased in

in bulk when heated, and diminished in bulk by being cooled. We may therefore consider expansion as one of the most general effects of heat. It is certainly one of the most important, as it has furnished us with the means of measuring all the others. Though all bodies are expanded by heat and contracted by cold, and this expansion in the same body is always proportional to some function of the quantity of caloric added or abstracted; yet the absolute expansion or contraction has been found to differ exceedingly in different bodies. In general, the expansion of gaseous bodies is greatest of all; that of liquids is much smaller, and that of solids the smallest of all. Thus, 100 cubic inches of atmospheric air, by being heated from the temperature of 32° to that of 212° , are increased to 137.5 cubic inches; while the same augmentation of temperature only makes 100 cubic inches of water assume the bulk of 104.5 cubic inches; and 100 cubic inches of iron, when heated from 32° to 212° , assume a bulk scarcely exceeding 100.1 cubic inches. From this example, we see that the expansion of air is more than eight times greater than that of water, and the expansion of water about 45 times greater than that of iron. An accurate knowledge of the expansion of gaseous bodies being frequently of great importance in chemical researches, many experiments have been made to ascertain it; yet, till lately, the problem was unsolved. The results of philosophers were so various and discordant, that it was impossible to form any opinion on the subject. This was owing to the want of sufficient care in excluding water from the vessels in which the expansion of the gases was measured. The heat which was applied converted portions of this water into vapour, which, mixing with the gas, totally disguised the real changes in bulk which it had undergone. To this circumstance we are to ascribe the difference in the determinations of de Luc, general Roy, Saussure, d'Ivernois, &c. Fortunately the problem has lately engaged the attention of Mr. Dalton of Manchester, and M. Gay Lussac; and their experiments, made with the proper precautions, have solved the problem. Mr. Dalton's experiments are distinguished by a simplicity of apparatus which adds greatly to their value, as it puts it in the power of others to repeat them without difficulty. It consists merely of a glass tube, open at one end, and divided into equal parts; the gas to be examined was introduced into it after being properly dried, and the tube is filled with mercury at the open end to a given point; heat is then applied, and the dilatation is observed by the quantity of mercury which is pushed out. Mr. Gay Lussac's apparatus is more complicated, but equally precise; and as his experiments were made on larger bulks of air, their coincidence with those of Mr. Dalton adds considerably to the confidence which may be placed in the results. From the experiments of these philosophers it follows, that all gaseous bodies whatever undergo the same expansion by the same addition of heat, supposing them placed in the same circumstances. It is sufficient then to ascertain the law of expansion observed by any one gaseous body, in order to know the exact rate of dilatation of them all. Now, from the experiments of Gay Lussac we learn, that air, by being heated from 32° to 212° , expand from 100 to 137.5 parts; the increase of bulk on 180° is then 37.5 parts; or, supposing the bulk at 32° to be unity, the increase is equal to 0.375 parts; this gives us 0.00203, or $\frac{1}{493}$ th part, for the expansion of air for 1° of the thermometer. Mr. Dalton found, that 100 parts of air, by being heated from 55° to 212° , expanded to 132.5 parts; this gives us an expansion of 0.00207, or $\frac{1}{483}$ th part, for 1° ; which differs as little from the determination of Lussac as can be expected in experiments of such delicacy. From the experiments of Mr. Dalton, it appears that the expansion of air is almost perfectly equable; that is to say, that the same increase of bulk takes place by the same addition of caloric at all different temperatures. It is true, indeed, that the rate of diminution appears to diminish as the temperature increases. Thus the expansion from 55° to $133\frac{1}{2}^{\circ}$, or for the first $77\frac{1}{2}$ degrees, was 167 parts; while the expansion from $133\frac{1}{2}^{\circ}$ to 212° , or for the next $77\frac{1}{2}^{\circ}$, was only 158 parts, or 9 parts less than the first. But this difference, in all likelihood, is chiefly apparent; for de Luc has demonstrated that the thermometer is not an accurate measure of the increase of heat. From the experiments of Gay Lussac, it appears that the steam of water, and the vapour of ether, undergo the same dilatation with air when the same addition is made to their temperature. We may conclude then that all elastic fluids expand equally and uniformly by heat; and that

this expansion is nearly equable, though not perfectly so. The following table gives us the bulk of a given quantity of air at all temperatures from 32° to 212° .

Tem.	Bulk.	Tem.	Bulk.	Tem.	Bulk.
32°	100000	59°	105616	86°	111232

58	105408	85	111024	212	137440

The expansion of liquid bodies differs from that of the elastic fluids, not only in quantity, but in the want of uniformity with which they expand when equal additions are made to the temperature of each. This difference seems to depend upon the fixity or volatility of the component parts of the liquid bodies; for in general those liquids expand most by a given addition of heat, whose boiling temperatures are lowest, or which contain in them an ingredient which readily assumes the gaseous form. Thus mercury expands less when heated to a given temperature than water, which boils at a heat much inferior to mercury; and alcohol is much more expanded than water, because its boiling temperature is lower. In like manner nitric acid is much more expanded than sulphuric acid; not only because its boiling point is lower, but because a portion of it has a tendency to assume the form of an elastic fluid. We may consider it therefore as a pretty general fact, that the higher the temperature necessary to cause a liquid to boil, the smaller the expansion is which is produced by the addition of a degree of heat; or, in other words, the expansibility of liquids is nearly inversely as their boiling temperature. Another circumstance respecting the expansion of liquids deserves particular attention. The expansibility of every one seems to increase with the temperature; or, in other words, the nearer a liquid is to the temperature at which it boils, the greater is the expansion produced by the addition of a degree of caloric; and, on the other hand, the farther it is from the boiling temperature, the smaller is the increase of bulk produced by the addition of a degree of caloric. Hence it happens, that the expansion of those liquids approaches nearest to equability whose boiling temperatures are highest; or, to speak more precisely, the ratio of the expansibility increases the more slowly, the higher the boiling temperature. These observations are sufficient to shew, that the expansion of liquids is altogether unconnected with their density. It depends upon the quantity of heat necessary to cause them to boil, and to convert them into elastic fluids. But we are altogether ignorant at present of the reason why different liquids require different temperatures to produce this change. The following table will give the reader a precise notion of the rate of expansion

pansion of those liquids which have been hitherto examined by chemical philosophers.

Temp.	Mer- cury.	Lin- seed oil.	Sul- phuric acid.	Nitric acid.	Water.	Oil of turpen- tine.	Alco- hol.

The expansion of solid bodies is so small, that a micrometer is necessary to detect the increase of bulk. As far as is known, the expansion is equable, at least the deviation from perfect equality is insensible. The following table exhibits the expansion of most of the solids which have been hitherto examined. Most of the experiments were made by Smeaton.

Temp.	Plati- num.	Anti- mony.	Steel.	Iron.	Cast- iron.	Bis- muth.

32°	120000	120000	120000	120000	120000	120000
212	120373	120323	120301	120247	120274	120218

The expansion of glass is a point of great importance, as it influences the result of most experiments on temperature. It has been examined with much precision by M. de Luc. The rate of its expansion, as settled by that philosopher, may be seen in the following table:

Temp.	Bulk	Temp.	Bulk.	Temp.	Bulk.
32°	100000	100°	100023	167°	100056
50	100006	120	100033	190	100069
70	100014	150	100044	212	100083

From this table it appears, that when glass is heated one degree, it undergoes an expansion which amounts nearly to $\frac{1}{100000}$ of the whole bulk. On the supposition that metals expand equably, the expansion of a mass of metal, by being heated a given number of degrees, is as follows: let a = the expansion of the mass in length for 1° , which must be found by experiment; b = the number of degrees whose expansion is required; s = the solid contents of the metallic mass; x = the expansion sought; then $x = 3bas$. The property which bodies possess of expanding, when heat is applied to them, has furnished us with an instrument for measuring the relative temperature of bodies. See THERMOMETER. Having considered the phenomena and laws of expansion as far as they are understood, it will be proper to state the exceptions to this general effect of heat, or the cases in which expansion is produced not by an increase, but by a diminution of temperature. These exceptions may be divided into two classes. The first class comprehends certain liquid bodies which have a maximum of density corresponding with a certain temperature; and which, if they are heated above that temperature, or cooled down below it, undergo in both cases an expansion or increase of bulk. The second class comprehends certain liquids which suddenly become solid when cooled down to a certain temperature; and this solidification is accompanied by an increase of bulk. Water furnishes us with the most remarkable example of the first class of bodies. Its maximum of density corresponds with $42^\circ.5$ of Fahrenheit's thermometer, as has been lately ascertained by Mr. Dalton. If it be cooled down below $42^\circ.5$, it undergoes an expansion for every degree of temperature which it loses; and at 32° the expansion amounts, according to Mr. Dalton, to $\frac{1}{100000}$ of the whole expansion which water undergoes when heated from $42^\circ.5$ to 212° . With this more recent experiments coincide very nearly: for by cooling 100000 parts in bulk of water, from $42^\circ.5$ to 32° , they were converted to 100031 parts. We are indebted to the ingenuity of Mr. Dalton for the discovery of a very unexpected fact, that the expansion of water is the same for any number of degrees above or below the maximum of density. Thus if we heat water ten degrees above $42^\circ.5$, it occupies precisely the same bulk as it does when cooled down ten degrees below $42^\circ.5$. Therefore the density of water at 32° and at 53° is precisely the same. Mr. Dalton succeeded in cooling water down to the temperature of 5° without freezing, or $37^\circ.5$ below the maximum point of density; and during the whole of that range, its bulk precisely corresponds with the bulk of water the same number of degrees above $42^\circ.5$. Thus the bulk of water at 5° is the same as the bulk of water at 80° . The scale of expansion, therefore, which has been given for the expansion of water when heated, answers also for its expansion when cooled, provided the table begin at $42^\circ.5$, as is done in the table of the expansion of water. From this table it appears that the expansion of water, the original bulk being 100000, may be expressed pretty nearly by the following numbers:

Temp.	Expan.
$82^\circ.5$	6 ^a
$102^\circ.5$	8 ^a
$122^\circ.5$	10 ^a
$142^\circ.5$	12 ^a
$162^\circ.5$	14 ^a

The greatest deviation from these numbers is towards the beginning of the scales, when owing to the smallness of the expansion, it is difficult to measure it with precision. It leads us to this remarkable conclusion, that the squares of the natural numbers beginning at 6 indicate the increase of bulk which 10000 parts of water experience for every ten degrees they are heated above $32^\circ.5$, or cooled below $12^\circ.5$. This rule will give the reader a more precise idea of the rate at which water expands when heated or cooled, than a bare inspection of the table could do. A considerable number

number of liquids has been tried to ascertain whether any of them, like water, have a temperature in which their density is a maximum, and which expand when cooled below that temperature. Sulphuric acid has no such point, neither have the oily bodies; but some solutions of salt in water begin to expand before they become solid. These solutions, however, when cooled down sufficiently, crystallize with such rapidity, that it is extremely difficult to be certain of the fact, that they do begin to expand before they crystallize. That class of bodies which undergo an expansion when they change from a liquid to a solid body by the diminution of temperature, is very numerous. Not only water when converted into ice undergoes such an expansion, but all bodies which by cooling assume the form of crystals. The prodigious force with which water expands in the act of freezing has been long known to philosophers. Glass bottles filled with water are commonly broken in pieces when the water freezes. The Florentine academicians burst a brass globe whose cavity was an inch in diameter, by filling it with water and freezing it. The force necessary for this effect was calculated by Muschenbroek at 27720 lbs. But the most complete set of experiments on the expansive force of freezing water are those made by major Williams at Quebec, and published in the second volume of the Edinburgh Transactions. This expansion has been explained, by supposing it the consequence of a tendency which water, in consolidating, is observed to have to arrange its particles in one determinate manner, so as to form prismatic crystals, crossing each other at angles of 60° and 120°. The force with which they arrange themselves in this manner must be enormous, since it enables small quantities of water to overcome so great mechanical pressures. Various methods have been tried to ascertain the specific gravity of ice at 32°; that which succeeded best was to dilute spirits of wine with water till a mass of solid ice put into it remained in any part of the liquid without either sinking or rising. The specific gravity of such a liquid is 0.92, which of course is the specific gravity of ice, supposing the specific gravity of water at 60° to be 1. This is an expansion much greater than water experiences even when heated to 212°. We see from this, that water, when converted into ice, no longer observes that equable expansion measured by Mr. Dalton, but undergoes a very rapid and considerable augmentation of bulk. The very same expansion is observed during the crystallization of most of the salts; all of them at least which shoot into prismatic forms. Hence the reason that the glass vessels in which such liquids are left, usually break to pieces when the crystals are formed. This expansion of these bodies cannot be considered as an exception to the general fact, that bodies increase in bulk when heat is added to them; for the expansion is the consequence, not of the diminution of heat, but of the change in their state from liquids to solids, and the new arrangement of their particles which accompanies or constitutes that change. It must be observed, however, that all bodies do not expand when they become solid. There are a considerable number which diminish in bulk; and in these the rate of diminution in most cases is rather increased by solidification. When liquid bodies are converted into solids, they either form prismatic crystals, or they form a mass in which no regularity of arrangement can be perceived. In the first case, expansion accompanies solidification; in the second place, contraction accompanies it. Water and all the salts furnish instances of the first, and tallow and oils are examples of the second. In these last bodies the solidification does not take place instantaneously, as in water and salts, but slowly and gradually: they first become viscid, and at last quite solid. Most of the oils, when they solidify, form very regular spheres. The same thing happens to honey, and to some metals. It has been thought that all combustible liquids contract, when they become solid, while incombustible liquids expand; but there are exceptions to this rule. Sulphuric acid does not by congelation alter its appearance; but cast iron, and perhaps sulphur also, expand in the act of congelation.

EX PARTE, a term used in the court of chancery, when a commission is taken out and executed by one side or party only, upon the other parties neglecting or refusing to join therein. When both the parties proceed together, it is called a joint commission.

EX PARTE TALIS, a writ that lies for a bailiff or receiver, that having auditors assigned to pass his accounts, cannot procure from them reasonable allowance, but is cast into prison; in which case the practice is to sue this writ out of the chancery, directed to the sheriff to take the four mainpernors to bring his body before the

barons of the exchequer, on a certain day, and to warn the lord to appear at the same time.

EXPECTANCY, ESTATES IN, are of two sorts; one created by act of the parties, called a remainder; the other, by act of law, called a reversion.

EXPECTANT, in law signifies having relation to, or depending on: thus, where land is given to a man and his wife, and to their heirs, they have a fee simple estate; but if it be given to them and the heirs of their bodies begotten, they have an estate tail, and a fee expectant, which is opposed to fee simple.

EXPECTATION, in the doctrine of chances, is applied to any contingent event, and is capable of being reduced to the rules of computation. Thus a sum of money in expectation, when a particular event happens, has a determinate value before that event happens; so that if a person is to receive any sum, *e. gr.* 10l. when an event takes place, which has an equal probability of happening and failing, the value of the expectation is half that sum, or 5l. and in all cases the expectation of obtaining any sum is estimated, by multiplying the value of the sum expected by the fraction which represents the probability of obtaining it. The expectation of a person who has three chances in five of obtaining 100l. is equal to $\frac{3}{5} \times 100$ or 60l. and the probability of obtaining 100l. in this case is equal to $\frac{3}{5} = \frac{60}{100}$. See **CHANCES**.

EXPECTATION OF LIFE. See **ANNUITIES**.

EXPECTORANTS, in pharmacy, medicines which promote expectoration; such as squills, &c.

EXPECTORATION, the act of evacuating or bringing up phlegm, or other matters out of the trachea, lungs, &c. by coughing, hawking, spitting, &c.

EXPEDITATION, in the forest laws, signifies the cutting out of the balls of a dog's fore-feet for the preservation of the king's game. Every one living near the park, that keeps any great dog not expeditated forfeits 3s. 4d. to the king. In mastiffs, not the ball of the feet, but the three claws are to be cut to the skin.

EXPERIMENT, in philosophy, is the trial of the result or effect of the applications and motions of natural bodies, in order to discover some of their motions and relations, whereby to ascertain some of their phenomena or causes.

EXPERIMENTAL PHILOSOPHY, that philosophy which proceeds on experiments, which deduces the laws of nature, and the properties and powers of bodies, and their actions upon each other, from sensible experiments and observations. The business of experimental philosophy is to inquire into and to investigate the reasons and causes of the various appearances or phenomena of nature, and to make the truth or probability thereof obvious and evident to the senses, by plain, undeniable, and adequate experiments, representing the several parts of the grand machinery and agency of nature. In our enquiries into nature, we are to be conducted by those rules and maxims which are found to be genuine, and consonant to a just method of physical reasoning; and these rules of philosophizing are by the greatest master in science, sir Isaac Newton, reckoned four, which are as follows: 1. More causes of natural things are not to be admitted, than are both true, and sufficient to explain the phenomena; for nature does nothing in vain, but is simple, and delights not in superfluous causes of things. 2. And, therefore, of natural effects of the same kind, the same causes are to be assigned, as far as it can be done: as of respiration in man and beasts, of the descent of stones in Europe and America, of light in a culinary fire and in the sun, and of the reflection of light in the earth and in the planets. 3. The qualities of natural bodies which cannot be increased or diminished, and agree to all bodies in which experiments can be made, are to be reckoned as the qualities of all bodies whatsoever: thus, because extension, divisibility, hardness, impenetrability, mobility, the vis inertiae, and gravity, are found in all bodies which fall under our cognizance or inspection, we may justly conclude they belong to all bodies whatsoever, and are therefore to be esteemed the original and universal properties of all natural bodies. 4. In Experimental philosophy, propositions collected from the phenomena by induction are deemed (notwithstanding contrary hypotheses) either exactly or very nearly true, till other phenomena occur, by which they may be rendered either more accurate, or liable to exception. This ought to be done, lest arguments of induction should be destroyed by hypotheses. These four rules of philosophizing are premised by sir Isaac Newton to his

third book of the Principia; and more particularly explained by him in his Optics, where he exhibits the method of proceeding in philosophy, the first part of which is as follows: As in mathematics, so in natural history, the investigation of difficult things, by way of analysis, ought always to precede the method of composition. This analysis consists in making experiments and observations, and in drawing general conclusions from them by induction (*i. e.* reasoning from the analogy of things by natural consequence,) and admitting no objections against the conclusions, but what are taken from experiments or certain truths. And although the arguing from experiments and observation, by induction, be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of, and may be looked on as so much the stronger, by how much the induction is more general; and if no exception occur from phenomena, the conclusion may be pronounced generally; but if at any time afterwards any exception shall occur from experiments, it may then be pronounced with such exceptions: by this way of analysis we may proceed from compounds to ingredients, and from motions to the cause producing them; and, in general, from effects to their causes; and from particular causes to more general ones, till the argument ends in the most general: this is the method of analysis. And that of synthesis, or composition, consists in assuming causes, discovered and established as principles, and by them explaining the phenomena, proceeding from them, and proving the explanations. See PHILOSOPHY, and PHYSICS.

EXPERIMENTUM CRUCIS, a capital or decisive experiment; thus termed, either on account of its being like a cross, or direction post, placed in the meeting of several roads, as guiding men to the true knowledge of the nature of that thing they are inquiring after; or on account of its being a kind of torture, whereby the nature of the thing is as it were extorted by force.

EXPIATION, in a figurative sense, is applied to the pardon procured to the sins of the penitent by the merit of Christ's death.

EXPIATION, among the Heathens, was of several kinds; by sacrifices and religious washing. They were used for effacing a crime, averting any calamity, and on numberless other occasions, as purifying towns, temples, &c. and armies before and after battle. And they were performed for whole cities, as well as particular persons.

EXPIATION, among the Jews, was chiefly by sacrifice, whether for sins of ignorance, or to purify themselves from certain pollutions.

EXPIATION, THE FEAST OF, among the Jews, called by our translators the day of atonement, was held on the 10th day of Tisri, the seventh month of the Jewish year, answering to part of September and October. See Levit. xvi. xxiii. 27, &c.

EXPIRATION, in physic, that part of respiration whereby the air is expelled, or driven out of the lungs.

EXPIRATION, in chemistry, is applied to all sorts of evaporation, and subtle effluvia, that go off into the air.

EXPIRATION is also used for the end of any term agreed upon. It likewise signifies death.

EXPLOSION, in natural philosophy, a sudden and violent expansion of an aerial or other elastic fluid, by which it instantly throws off any obstacle, sometimes with incredible force, and in such a manner as to produce the most astonishing effects upon the neighbouring objects. Explosion differs from expansion, in that the latter is a gradual and continued power, acting uniformly for some time; whereas the former is always sudden, and only of momentary duration. The expansions of solid substances do not terminate in violent explosions; on account of their slowness, and the small space through which the metal, or other expanding substance, moves; though their strength may be equally great with that of the most active aerial fluids. Thus we find, that though wedges of wood, when wetted, will cleave solid blocks of stone, they never throw them to any distance, as is the case with gunpowder. On the other hand, it is seldom that the expansion of any elastic fluid bursts a solid substance, without throwing the fragments of it to a considerable distance, the effects of which are often very terrible. The reasons of the above phenomena are, 1. The immense velocity with which the aerial fluids expand, when effected by considerable degrees of heat; and, 2. Their celerity in acquiring heat, and being affected by it, which is much superior to that of solid substances. Thus air, heated as much as iron, when brought to a white heat, is expanded to four times its bulk; but

the metal will not be expanded the 500th part of the space. In the case of gun-powder, the velocity with which the flame moves is calculated by Mr. Robins, in his Treatise upon Gunnery, to be no less than seven thousand feet in a second, or nearly seventy-nine miles per minute. Hence the impulse of the fluid is inconceivably great, and the obstacles on which it strikes are hurried off with vast velocity, though much less than that just mentioned; for a cannon bullet, with the greatest charge of powder that can be conveniently given, does not move at a greater rate than two thousand four hundred feet per second, or little more than twenty-seven miles per minute. The velocity of the bullet again is promoted by the sudden propagation of the heat through the whole body of air, as soon as it is extricated from the materials of which the gun-powder is made; so that it is enabled to strike all at once, and thus greatly to augment the momentum of the ball. It is evident that this contributes very much to the force of the explosion, by what happens when powder is wetted or mixed with any substance, which prevents it from taking fire all at once. In this case the force of the explosion, even when the same quantity of powder is made use of, is vastly inferior to that of dry powder. Upon these principles we may conclude, that the force of an explosion depends, 1. On the quantity of elastic fluid to be expanded. 2. On the velocity it acquires by a certain degree of heat; and, 3. On the celerity with which the degree of heat affects the whole of the expandible fluid. These three take place in the greatest perfection where the electric fluid is concerned; as in cases of lightning, earthquakes, and volcanoes.

EXPONENT, [from *expono*, to shew,] in algebra, is a number placed over any power or involved quantity, to shew to what height the root is raised: thus 2 is the exponent of x^2 , and 4 the exponent of x^4 , &c. See ALGEBRA.

EXPONENTIAL CALCULUS. See CALCULUS.

EXPONENTIAL CURVE is that whose nature is defined or expressed by an exponential equation; as the curve denoted by $a^x = y$, or by $x^a = y$. The area of any exponential curve, whose nature is expressed by this exponential equation $x^a = y$

(making $1 + v = x$) will be $\frac{1}{0.1.2} v^2 + \frac{1}{0.1.2.3} v^3 - \frac{1}{0.1.2.3.4} v^4 + \frac{1}{0.1.2.3.4.5} v^5 - \frac{1}{0.1.2.3.4.5.6} v^6$, &c.

EXPONENTIAL EQUATION is one in which is contained an exponential quantity: as the equation $a^x = b$, or $x^a = ab$, &c.

EXPONENTIAL QUANTITY is a quantity whose power is a variable quantity, as x^a , a^x . Exponential quantities are of several degrees and orders, according as the exponents themselves are more or less involved. If the exponent be a simple quantity, as 2^x , it is called an exponential of the first or lowest degree; but when the

exponent itself is an exponential of the first degree as 2^x it is called an exponential of the second degree. In like manner, if the

exponent itself be an exponential of the second degree, as 2^{x^2} , it is called an exponential of the third degree, &c.

EXPORTATION. See TRADE.

EXPOSING, in the Latin church, the sacrament is said to be exposed when it is shewn in public uncovered on festival days, and during the time of plenary indulgences.

EXPOSING OF CHILDREN, a barbarous custom practised by most ancient nations, excepting the Thebans, who had an express law, whereby it was made capital to expose children, and ordained that such as were not in a condition to educate them should bring them to the magistrates, to be brought up at the public expence. Among the other Greeks, when a child was born, it was laid on the ground; and if the father designed to educate his child, he immediately took it up: but if he forbore to do this, the child was carried away and exposed.

EXPRESSED OILS, in chemistry, such oils as are obtained from bodies only by pressing. See OIL.

EXPRESSION, in algebra, any algebraical quantity, simple or compound; as $3a$, $2ab$, or $4ax + d$, &c.

EXPRESSION, in chemistry, or pharmacy, denotes the act of pressing out the juices of vegetables, which is one of the three ways of obtaining them; the other two being by infusion and decoction. See PHARMACY.

EXPRESSIO.

EXPRESSION, in painting, is the distinct exhibition of character in the general object of the work, or of sentiment in the characters or persons represented. In the latter case it consists either in representing the body in general and all its parts severally, in actions most peculiarly suitable to the design of the picture, and marking thereby the emotions of the soul in the various figures, or in portraying in the face the appearances of the passions. In this sense the term expression has been frequently confounded with passion; but the former implies a representation of its object agreeable to its nature and character, and to the office it holds on the picture; while the latter denotes merely a particular turn or motion of the body, or of the muscles and features of the face, which marks any violent agitation of the soul: so that every passion is an expression, but not every expression a passion. See **PAINTING** and **DRAWING**.

EXPRESSION, in rhetoric, elocution, diction, or choice of words in a discourse. Beautiful expression is the natural and true light of our thoughts: it is to this we owe all the excellencies in discourse, which gives a kind of vocal life and spirit. As the principal end of discourse is to be understood, the first thing we should endeavour to obtain is a richness of expression, or habit of speaking so well as to make our thoughts easily understood. See **ORATORY**.

EXSPUITION, [*expusio*, Latin,] a discharge of saliva by spitting.

EXTASY, [*ecstasy*,] a transport which suspends the function of the senses, by the intense contemplation of some extraordinary or supernatural object, or when God impresses on the imagination the extraordinary ideas of any thing he would reveal.

EXTASY, in medicine, a species of catalepsy, when a person perfectly remembers after the paroxysm is over, the ideas he conceived during the time it lasted. In an extasy there must be an unusual tension of the sensory, as is common in delirium, &c.

EXTEND, in law, signifies to value the lands or tenements of a person bound by a statute, &c. who has forfeited the same, at such an indifferent rate, that by the yearly rent the creditor in time may be paid his debt. See **EXTENT**.

EXTENDI FACIAS, a writ to extend lands, &c. See the preceding article.

EXTENSION, in philosophy, one of the common and essential properties of body, or that by which it possesses or takes up some part of universal space, which is called the place of that body. Extension is threefold, 1. Either into length only, and then it is called a line. Or, 2. Into length and breadth, which is called a superficies. Or, 3. Into length, breadth, and depth, which is called a solid; being the three dimensions according to the quantity of which the magnitude or bulk of bodies are estimated. See **LINE**, **SUPERFICIES**, and **SOLID**. See also **PHYSICS** and **METAPHYSICS**.

EXTENSOR, an appellation given to several muscles, from their extending or stretching the parts to which they belong.

EXTENT, in law, is used for, 1. a writ to the sheriff for the valuing of lands or tenements; and 2. the act of the sheriff, or commissioner, upon this writ.

EXTENUATION, a figure in rhetoric, the opposite of the hyperbole. The Greeks call it *σβαλιν*.

EXTERMINATION, or **EXTERMINATING**, in algebra, is used for taking away. Thus algebraists speak of exterminating surds, fractions, and unknown quantities, out of equations. See **MACLAUR. ALGEBR. part. i. chap. 12**, where we have some general theorems for the exterminating of unknown quantities in given equations. See also **ALGEBRA**, in this work.

EXTERNAL ANGLES, are the angles on the outside of any right-lined figure, when all the sides are severally produced, and they are all, taken together, equal to four right angles. See **GEOMETRY**.

EXTINGUISHMENT, in law, is a consolidation, where one has due to him a yearly rent, and afterwards purchases the lands out of which the rents arise; both the property and the rent being thus united in one possessor, the rent is said to be extinguished.

EXTIRPATIONE, in law, a judicial writ that lies against a person, who, after a verdict found against him for land, &c. maliciously overthrows a house, or extirpates any trees upon it.

EXTIRPATION, in surgery, the cutting off of any part entirely, as a wen, &c. or the eating of it away, as a wart, &c. by corrosive medicines.

EXTISPEX, [Lat.] in antiquity, the person who drew presages from viewing the entrails of animals offered in sacrifice.

EXTORTION, in law, is an illegal manner of wresting any thing from a man, either by force, menace, or authority. It is also the exaction of unlawful usury, winning by unlawful games, and taking more than is due under pretence of right, as excessive tolls in millers, &c. At the common law, extortion is punishable by fine and imprisonment; and the statute of 3 Eliz. 1, c. 30, has enacted, that officers of justice guilty of extortion for the expedition of business, &c. shall render to the party treble value. There are likewise divers other statutes for punishing extortions of sheriffs, bailiffs, gaolers, clerks of the assize, and of the peace, attorneys, solicitors, &c.

EXTRA, a Latin preposition signifying without, and used in composition with other words, as for instance, 1. Extra-judicial, where judgement is given in a cause that is not depending in the court where the same passed; or whereon the judgement has no jurisdiction. 2. Extra-parochial, which is said of places out of the bounds of any parish, or freed from the duties of a parish. The greatest part of the forests in England are extra-parochial.

EXTRACTION, in genealogy, implies the stock or family from which a person is descended.

EXTRACTION, in surgery, is the drawing of any foreign matter out of the body by the hand, or by the help of instruments. See **SURGERY**.

EXTRACTION OF ROOTS, in algebra and arithmetic, the methods of finding the roots of given numbers or quantities. See **ALGEBRA**, and **ARITHMETIC**.

EXTRACTOR, in midwifery, an instrument for extracting children by the head.

EXTRACTS, in pharmacy, are those medicinal preparations obtained by boiling vegetable substances in water, and evaporating the strained decoction in broad, shallow vessels, to a thick consistence. Thus the most active parts of the plants are separated from the useless insoluble earthy matter. As extraction is a chemical process, generally performed by the apothecary, we shall only observe, that the following extracts are directed to be kept in the shops by the London college: viz. extract of broom-tops; of cascarrilla; of chamomile; of Peruvian bark with, and without, its resin; of colocynth compounded with aloe, scammony, &c.; of gentian; of liquorice; of black hellebore; of jalap; of log-wood; of white poppy; of rue; of savin; of senna; of wild cucumbers, &c.

EXTRADOS, the outside of an arch of a bridge, vault, &c.

EXTRAJUDICIAL, in law, is when judgement is given in a cause, not depending in that court where it is given, or wherein the judge has no jurisdiction.

EXTRAORDINARIUM, among the Romans, was a body of men consisting of a third part of the foreign horse, and a fifth of the foot, which was separated from the rest of the forces borrowed from the confederate states with great policy and caution, to prevent any design that they might entertain against the natural forces.

EXTRAVAGANTES, decretal epistles published after the Clementines; so called, because at first they were not ranged with the other papal constitutions, but seemed to be detached from the canon law. They were afterwards inserted in the body of the canon law.

EXTRAVASATION, arises from the bursting or breaking of one or more of the blood-vessels, after contusions, fractures, and other injuries of the head, as well as other parts of the body: this accident is attended with such a copious discharge of blood, as frequently occasions the most violent pain, and death itself, unless the patient be timely relieved. See **MEDICINE** and **SURGERY**.

EXTREME, and **MEAN PROPORTION**, in geometry, is when a line is so divided, that the whole line is to the greater segment, as that segment is to the other: or, when the line is so divided, that the rectangle under the whole line, and the less segment, is equal to the square of the greater segment.

EXTREMES, in logic, denote the two extreme terms of the conclusion of a syllogism, viz. the predicate and subject. They are called extremes, from their relation to another term, which is a medium or mean between them. The predicate, as being likewise had in the first proposition, is called the *major extremum*, greater extreme; and the subject, as being put in the second or

minor proposition, is called the minus extremum, less extreme. Thus, in the syllogism, man is an animal; Peter is a man, therefore Peter is an animal; the word animal is the greater extreme, Peter the less extreme, and the man the medium. See SYLLOGISM, and LOGIC.

EXTREMES CONJUNCT, and **EXTREMES DISJUNCT**, in spherical trigonometry, are, the former the two circular parts that lie next the assumed middle part, and the latter are the two that lie remote from the middle part. These were terms applied by lord Napier, in his universal theorem for resolving all right-angled and quadrantal spherical triangles, and published in his *Logarithmorum Canonis Descriptio*, 1614. In this theorem, Napier condenses into one rule, in two parts, the rules for all the cases of right-angled spherical triangles, which had been separately demonstrated by Pitiscus, Lansbergius, Copernicus, Regiomontanus, and others. See TRIGONOMETRY.

EXTREME UNCTION. See UNCTION.

EXTREMITIES OF FIGURES in painting, are the head, hands, and feet. These should be drawn with more nicety and exactness, or more terminated than other parts; and thus help to render the action more expressive.

EXTRINSIC, among metaphysicians, is taken in various senses: as, 1. a thing's not belonging to the essence of another; in which sense, the efficient cause and end of a thing are said to be extrinsic: 2. a thing's not being contained within the capacity of another; in which sense, those causes are called extrinsic which introduce something into a subject from without, as when a fire introduces heat: 3. a thing added or applied to another; in which sense accidents and adherents are said to be extrinsic to the subjects to which they adhere: 4. the vision is said to be extrinsic from some form which does not exist in that thing, but is adjacent to it, or by some means or other without it.

EXVERRÆ, or **EXVERRIÆ**, in antiquity, a kind of besom, used in cleansing houses out of which a dead person had been carried.

EXVERRIATOR, or **EVERRIATOR**, a title given to the heir of one deceased, from his being obliged to perform the ceremony of sweeping with the exverræ. See the last article.

EXUVIÆ, [Lat.] cast skins; cast shells; whatever is thrown off, or shed by animals.

EXUVIÆ, is also used for some shells, and other marine bodies, frequently found in the bowels of the earth; supposed to have been deposited there at the deluge, as being the real spoils of once living creatures.

EYBENSTADT, or **EYBENSTOCK**, a considerable mine town of Upper Saxony, seven miles S. W. of Schwartzenberg.

EYE, [*oculus*], in anatomy, the organ of sight; or that part of the body, whereby visible objects are represented to the mind. See ANATOMY, and OPTICS. A new-born child never keeps its eyes fixed on any one object, but continually changes from one to another; and if a hand is put before them, the child will not wink. Hence some have thought that new-born infants have no sight, but this is a mistake. The true reason why their eyes are in perpetual motion is, that they have not yet acquired the habit of examining one thing at once with their eyes: their not winking at the approach of the hand, arises from their want of experience how easily their eyes may be hurt; but in a few days they get the habit of winking, and afterwards wink spontaneously at the approach of danger.

EYE OF A DOME, an aperture at the top of a dome, as that of the Pantheon at Rome, or of St. Paul's at London: it is usually covered with a lantern.

EYE, in agriculture and gardening, signifies a little bud, inserted into a tree by way of graft. See GRAFTING.

EYE OF A TREE, a small pointed knot to which the leaves stick, and from which the shoots or sprigs proceed. See GEMMA.

EYE, a river of Scotland, which rises in the N. W. of Berwickshire, and falls into the British ocean at Eyemouth.

EYE, a town of Suffolk, near the borders of Norfolk, 21 miles N. of Ipswich.

EYE, a town of Norway, 36 miles S. of Bergen.

EYE, BULL'S. See ALDEBARAN, and BULL'S EYE.

EYE OF A BLOCK, in naval affairs, that part of the rope-strop which is fastened to some necessary place in the ship: the strop is a sort of wreath, or rope formed into a ring, and fixed round the block for the double convenience of strengthening the block, and fastening it in any place where it is wanted.

EYE-BRIGHT. See EUPHRASIA.

EYE-BROWS. See ANATOMY.

EYE-LIDS. See ANATOMY.

EYEMOUTH, a town of Scotland, at the mouth of the Eye, 9 miles N. by W. of Berwick. Lon. 1. 50. W. Lat. 55. 50. N.

EYERLANDT, an island of Batavia, in the department of the Texel, at the entrance into the Zuyder Zee.

EYESDALE, a small island of Scotland, on the coast of Argyshire, S. E. of Mull; famous for slates.

EYMOUTIERS, a town of France, in the department of Dordogne; 15 miles N. of Périgueux.

EYMOUTIERS, a town of France, in the department of Upper Vienne, 18 miles N. of Limoges.

EYNDHOVEN, or **EIENHOVEN**, a town of Batavia, in the department of Dommel and Scheldt, and late province of Dutch Brabant; 17 miles S. of Bois-le-duc.

EYRAC, or **IRAC**, **AGEMI**, the principal province of Persia, anciently called Parthia.

EYRAC, or **IRAC**, **ARABIA**, a province of Turkey in Asia, 345 miles in length, and 190 in breadth. Bagdad is the capital.

EZAGEN, or **EZAGUEN**, an ancient and opulent town in the kingdom of Fez, and province of Habat, 60 miles S. of Tetuan.

EZEKIEL, [עִזְקִיָּאל, Heb. *i. e.* the strength of God,] a celebrated prophet and priest among the Jews, who was carried captive to Babylon with Jeconiah, and began his prophesies in the fifth year of the captivity, A. M. 3409. He was cotemporary with Jeremiah, who prophesied at the same time in Judea. He foretold many events, particularly the destruction of the temple, the fatal catastrophe of those who revolted from Babylon to Egypt, and the happy return of the Jews to their own land.

EZEKIEL, a canonical book of the Old Testament, referring chiefly to the degenerate manners and corruptions of the Jews of those times. It abounds with fine sentences and rich comparisons, and shews the author to have had much learning.

EZEL, an island of Russia, in the Baltic, of a triangular form, eight miles in circumference.

EZETOVA, a river of Russia, which runs into the Gulf of Ob-skala.

EZRA, [עֶזְרָא, Heb. *i. e.* a helper,] an eminent author, priest, and lawyer, among the Jews, and a chief director of their church and state under Artaxerxes I. See ESDRAS. This illustrious author was also the restorer and publisher of the canon of the Old Testament.

EZRA, a canonical book of the Old Testament; comprehending the history of the Jews from the time of Cyrus's edict for their return, to the 20th year of Artaxerxes Longimanus. It specifies the number of Jews who returned, and Cyrus's proclamation for the rebuilding of the temple, together with the laying of its foundation, the obstruction it met with, and the finishing thereof in the reign of Darius.

F.

F, the sixth letter of the alphabet, and fourth consonant, is by some reckoned a mute, and by others a semi-vowel: it has much the same sound with the Greek ϕ , or *ph*; in English words, and is only written in words of Latin origin, *ph* being used instead of it in those derived from the Greek. Suetonius tells us, that the emperor Claudius invented the *f*, and two other letters; and that it had the force of *v* consonant, and was wrote inverted *g*. I. *F*, in music, is the fourth note in rising, in this order of the gamut, ut, re, mi, fa. It likewise denotes one of the Greek keys in music, destined for the bass. II. As an abbreviation, *F*, in physical prescriptions; stands for fiat, i. e. let it be done, or made up. Thus *f. s. a.* signifies fiat secundum artem. *F*, in the civil law, doubled thus, *ff*, signifies the pandects. See **PANDECTS**. *F*, in the criminal law, was a stigma put upon felons with a hot iron, on their being admitted to the benefit of clergy; by stat. 4 Hen. 7. c. 13. III. *F*, as a numeral, anciently signified 40, and when a dash was added at top, (thus *F̄*) it stood for 40,000.

FA, in music, the fourth note of the gamut. See **F**. Musicians distinguish two *fa*'s, viz. the flat, marked with a *b*, or $\flat$; and the sharp, or natural, marked thus *♯*, and called also *biquadro*.

FAABORG, a sea-port town of Denmark, on the S. coast of the isle of Funen, 17 miles S. of Oldensee. Lon. 10. 16. E. Lat. 55. 12. N.

FABA, in botany. See **VICIA**.

FABER, a fish of the zeus kind, called in English doree, or john doree. See **ZEUS**.

FABIANE, a river of N. America, in Louisiana, which runs S. E. and falls into the Mississippi, in Lat. 39. 30. N.

FABIUS, the surname of a powerful patrician family at Rome, who derived their name from *faba*, a bean, because some of their ancestors cultivated this pulse. They were once so numerous that they took upon themselves to wage a war against the Veientes. They came to a general engagement near the Cremera, in which all the family, consisting of 306 men, were slain, A. U. C. 277. There only remained one boy, whose tender age had detained him at Rome, and from him descended the noble Fabii of the following ages.

FABIUS MAXIMUS, QUINTUS, a celebrated Roman, who from a dull and inactive childhood was raised to the highest offices of the state. In his first consulship he obtained a victory over Liguria, and the fatal battle of Thrasymenus occasioned his election to the dictatorship. In this important office he began to oppose Hannibal, not by fighting him in the open field, like his predecessors, but by continually harassing his army by countermarches and ambuscades, from which he received the surname of Cunctator, or the Delayer. Hannibal sent him word, that "if he was as great a captain as he would be thought, he ought to come into the plain and give him battle." But Fabius coldly replied, "that if he was as great a captain as he would be thought, he would do well to force him to fight." Such operations for the commander of the Roman armies gave offence to some: and Fabius was even accused of cowardice. He, however, continued firm in his resolution; and patiently bore to see his master of horse raised to share the dictatorial dignity with himself, by his enemies at home. When he had laid down his office of dictator, his successors, for a while, followed his plan; but the rashness of Varro, and his contempt for the operations of Fabius, occasioned the fatal battle of Cannæ. Tarentum was obliged to surrender to him after the battle of Cannæ; and on that occasion the Carthaginians observed, that Fabius was the Hannibal of Rome. When he had made an agreement with Hannibal for the ransom of the captives, which was totally disapproved by the Roman senate, he sold all his estates to pay the money, rather than forfeit his word to the enemy. The bold proposals of young Scipio to carry the war from Italy to Africa, was rejected by Fabius as chimerical and dangerous. He did not, however, live to see the success of the Roman arms under Scipio, and the conquest of Carthage by measures which he treated with contempt, and heard with indignation. He died in the 100th year of his age, after he had been five times consul, and twice honoured

with a triumph. The Romans were so sensible of his great merit and services, that the expences of his funeral were defrayed from the public treasury.

FABIUS MAXIMUS, QUINTUS, son of the preceding, shewed himself worthy of his father's virtues. During his consulship he received a visit from his father on horseback in the camp. The son ordered the father to dismount; and the old man cheerfully obeyed, embracing his son, and saying, "I wished to know whether you know what it is to be consul?" He died before his father, who with the moderation of a philosopher, delivered a funeral oration over his son's body.

FABIUS MAXIMUS RULLIANUS was the first of the Fabii who obtained the surname of Maximus, for lessening the power of the populace at elections. He was master of horse, and his victory over the Samnites in that capacity nearly cost him his life, because he engaged the enemy without the command of the dictator. He was five times consul, twice dictator, and once censor. He triumphed over seven different nations, and rendered himself illustrious by his patriotism.

FABIUS PICTOR, a Roman general and historian. He first introduced painting at Rome; and having caused the walls of the temple of Health to be painted, some authors have erroneously reckoned him a painter. He died about B. C. 216.

FABLE, [*fabula*, Lat.] a tale or feigned narration, designed either to instruct or divert, disguised under the allegory of an action, &c. Fables were the first pieces of wit that made their appearance in the world, and have been still highly valued, not only in times of the greatest simplicity, but among the most polite ages of the world. Jotham's fable of the trees is the oldest that is extant, and as beautiful as any that have been made since. Nathan's fable of the poor man is next in antiquity, and had so good an effect as to convey instruction to the ear of a king. We find Æsop, in the most distant ages of Greece; and in the early days of the Roman commonwealth, we read of a mutiny appeased by the fable of the belly and the members. As fables had their rise in the very infancy of learning, they never flourished more than when learning was at its greatest height; witness Horace, Boileau, and Fontaine.

FABLE is also used for the plot of an epic or dramatic poem, and is, according to Aristotle, the principal part, and, as it were, the soul of a poem. See **POETRY**.

FABRETTI, RAPHAEL, LL.D. a learned Italian author and antiquary, born at Urbino, in 1619. He studied at Cagli, and took his degree at Urbino, in his 18th year. Cardinal Imperiali sent him into Spain, where he continued thirteen years, and was for some time auditor general of the Nunciature. On his return to Rome, he was appointed judge of appeals, and afterwards inspector of reliques. Pope Alexander VIII. appointed him Secretary of memorials, and Innocent XII. made him keeper of the archives of St Angelo. In the midst of all this business he found time to cultivate his favourite study of antiquities, and upon which he wrote several tracts in Latin, particularly, 1. *De Aquæ & Aquæ Ductibus Veteris Romæ*: 2. *De Columna Trajana*: 3. *Inscriptionum Antiquarum Explicatio*, &c. He was admitted a member of the academy of Asorditi at Urbino, and of the Arcadi at Rome, and died Jan. 7, 1700.

FABRIANO, a town of Italy, in the marquisate of Ancona, at the foot of the Apennines, 16 miles N. of Nocera.

FABRIC-LANDS, those formerly given towards rebuilding or repairing cathedrals and other churches; for anciently almost every body gave more or less, by his will, to the fabric of the parish-church where he dwelt.

FABRICIA, in botany, a genus of the icosandria monogynia class and order. Calyx five-cleft, half superior; five petals, without claws; stigma capitate; capsule many-celled; seeds winged. It has two species: viz. the myrtifolia, and the levigata, natives of New Holland.

FABRICIUS, CAIUS, a celebrated Roman, who in his first consulship, A. U. C. 470, obtained several victories over the Sam-

nites and Lucanians, and was honoured with a triumph. The riches acquired in those battles were immense, the soldiers were liberally rewarded, and the treasury was enriched with 400 talents. Two years after, Fabricius went as ambassador to Pyrrhus, and refused with contempt presents and offers, which might have corrupted the fidelity of a less virtuous citizen. Pyrrhus admired the magnanimity of Fabricius, but his astonishment was excited to the highest pitch, when Fabricius discovered to him the villainy of his own physician, who had offered to the Roman general, for a sum of money, to poison his royal master. To this greatness of soul was added the most consummate knowledge of military affairs, and the greatest simplicity of manners. Fabricius never used rich plate at his table. A small salt-cellar, the feet of which were of horn, was the only silver vessel which appeared in his house. This contempt of luxury Fabricius wished to inspire among the people; and during his censorship he banished from the senate Cornelius Rufinus, who had been twice consul and dictator, because he kept in his house more than ten lib. weight of silver plate. Such were the manners of the conqueror of Pyrrhus, who observed that he wished rather to command those that had money than possess it himself. He lived and died in virtuous poverty; his body was buried at the public charge; and the Roman people gave a dowry to his two daughters when they had arrived to years of maturity.

FABRICIUS, GEORGE, a learned German, born at Chemnitz in Misnia, in 1516. After a liberal education, he visited Italy in quality of a tutor to a young nobleman; and examining all the remains of antiquity with great accuracy, compared them with their descriptions in Latin writers. The result of these observations was his work intitled "Roma," containing a description of that city. He afterwards settled at Misenum, where he conducted a great school till his death in 1571. He also wrote seven books of the "Annals of Misnia," three of the "Annals of Meissen," Travels, and many sacred poems in Latin.

FABROT, CHARLES HANNIBAL, one of the most celebrated civilians of his time, was born at Aix in 1681; and acquired an extraordinary skill in the civil and canon law, and in the belles lettres. He published the "Basilicæ, or Constitutions of the Emperors of the East," in Greek and Latin, with learned notes, in 7 vols. folio; and editions of "Cedrenus, Nicetas, Anastasius, Bibliothecarius, Constantine Manasses, and Cujas," with learned and curious notes.

FACADE, [Fr.] the face or front of a building.

FACALA, or FACALE, a sea-port of Japan, where the Jesuits formerly had a church and establishment.

FACE, [*facies*,] generally signifies the visage of any animal: it is more particularly applied to the human countenance; being the only conspicuous part of the body. The human face is called the image of the soul, because it is the seat of the principal organs of sense, and the place where the ideas and emotions of the mind are most obviously displayed. It has always been considered the most comely and expressive part of the frame, so that various lotions, powders, &c. have been invented for beautifying and restoring ugly or decayed countenances. Such practice, however, though sanctioned by the folly and caprice of fashion, cannot be too severely censured. The face also serves to indicate the sex, age, temperament, health, disease, &c. As the index of the passions, habits, &c. of the person, it makes the subject of physiognomy. See **PHYSIOGNOMY**.

FACE, among painters and artists, denotes a certain dimension of the human body, adapted for determining the proportion which the several parts should bear to one another. See **DRAWING**.

FACE, or FACADE, in architecture, the front of a building, or the side which contains the chief entrance. Sometimes, however, it is used for whatever side presents to the street, garden, court, &c. or is opposite to the eye.

FACE, in fortification, an appellation given to several parts of a fortress, as the face of a bastion, &c. See **FORTIFICATION**.

FACE, in the military art, a word of command, intimating to turn about: thus, "Face to the right," is to turn upon the left heel a quarter-round to the right; and "Face to the left," is to turn upon the right heel a quarter-round to the left.

FACET, or FACETTE, among jewellers, the name of the

little faces or planes to be found in brilliant and rose diamonds.

FACTION, in antiquity, a name given to the different companies of combatants in the circus. They were four; viz. the white, the red, the green, and the blue; to which Domitian added another of purple colour. They were so denominated from the colour of the liveries they were; and were dedicated, according to M. Aur. Cassiodorus, to the four seasons of the year; the green being consecrated to spring, the red to summer, the white to autumn, and the blue to winter. It appears from ancient inscriptions, that each faction had its procurators and physician; and from history, that party rage ran so high among them, that in a dissension between two factions, in the time of Justinian, almost 40,000 men lost their lives in the quarrel.

FACTITIOUS, any thing made by art, in opposition to what is the produce of nature. Thus, factitious cinnabar is opposed to native cinnabar.

FACTOR, in commerce, is an agent or correspondent residing beyond the seas, or in some remote part, commissioned by merchants to buy or sell goods on their account, or assist them in carrying on their trade.

FACTORS are employed by merchants residing at other places, to buy or sell goods, negotiate bills, &c. on their account; and are entitled to a certain allowance for their trouble. A supercargo differs from a factor in this: the business of the former is limited to the care of a particular cargo; he goes along with it, and generally returns when his business is completed: the latter has a fixed residence abroad, and executes business for different merchants. But their duties, and the circumstances for which they are accountable, are the same. The duty of a factor is to procure the best intelligence of the state of the trade at his place of residence; of the course of exchange; of the quantity and quality of goods at market, their current price, and the probability that it may rise or fall; to pay exact obedience to the orders of his employers; to consult their advantage in matters referred to his direction; to execute their business with all the dispatch that circumstances admit; to be early in his intelligence, distinct in his accounts, and punctual in his correspondence. A factor's power is either absolute or limited. Though entrusted with ample discretionary powers, he is not warranted to take unreasonable or unusual measures, or do any thing contrary to his employer's interest; but it is incumbent on the employer, if he challenge his proceedings, to prove that he could have done better, and was guilty of wilful mismanagement. When a factor's power is limited, he must adhere strictly to his orders. If he exceed his power, though with a view to his employer's interest, he is liable for the consequence. For example, if he give credit when not empowered, or longer credit if not empowered, for the sake of a better price, and the buyer prove insolvent, he is liable for the debt. A factor has no power to give credit unless authorised: but if the goods consigned be generally sold on credit at the place of consignment, the factor will be vindicated for selling at the usual credit, unless expressly restricted. Although opinion will never justify the factor for departing from orders, necessity sometimes will. If he be limited not to sell goods under a certain price, and the goods be perishable, and not in a situation for being kept, he may sell them, to prevent their destruction, even under the price limited. A factor is never warranted to deal on trust, except with persons in good credit at the time. If the employer challenge the debtors, it is incumbent on him to prove that their bad circumstances was known at the time of sale; and the factor will be vindicated, if he trusted them at the same time for goods of his own. If the factor sell his employer's goods on trust, and, after the day of payment is elapsed, receive payment from the purchaser for a debt of his own, he becomes liable in equity for the debt. In case of bankruptcy, the factor ought immediately to lay attachments, and advise his employers; and he cannot withdraw his attachments, nor compound debts without orders. If a factor sell goods belonging to different merchants to the same person, and the buyer prove insolvent, they shall bear the loss in equal proportions; and, if the buyer have paid part before his insolvency, without specifying for which, the payment ought to be distributed in equal proportions; but, if the days of payment be fixed, and part of the debts only due, the payment ought to be applied, in the first place, to such debts as were due. If he make a wrong entry

entry at the custom-house, and the goods be seized in consequence thereof, he must bear the loss, unless the error be occasioned by a mistake in the invoice, or letter of advice. The owner bears the loss of goods seized when attempted to be smuggled by his orders: but the factor complying with an unlawful order is liable in such penalties as the laws exact. If a factor save the duty of the goods due to a foreign prince, he shall have the benefit; for, if detected he bears the loss. If a factor sell goods bought by his employer's orders for his own advantage, the employer may recover the benefit, and the factor shall be amerced for the same. If a factor receive bad money in payment, he bears the loss; but if the value of the money be lessened by the government, the employer bears the loss. A factor is not liable for goods spoiled, robbed, or destroyed by fire. If a factor receive counterfeit jewels from his employer, and sell them, the employer is liable to indemnify him for any penalties he may incur. If a factor be ordered to make insurance, and neglect it, and the subject be lost, he is liable to make it good, providing he had effects in his hands. If a factor buy goods for his employer, his bargain shall be binding on the employer. In case of a factor's insolvency, the owner may reclaim his goods; and, if they be sold on trust, the owner (and not the factor's creditors) shall recover payment of the debts.

FACTOR, in multiplication, a name given to the multiplier and multiplicand, because they constitute the product. See **ARITHMETIC**.

FACTORAGE, called also commission, is the allowance given to factors by the merchants who employ them.

FACTORY is a place where a considerable number of factors reside, to negotiate for their masters and employers. The most considerable factories belonging to the British are those established in the East Indies. There were also factories in Portugal, Turkey, and at Hamburg, Petersburg, Dantzic, and Amsterdam, all endowed with certain privileges. The ascendancy of the French Emperor, for the present, at least, has put an end to these, or to most of them. However, we indulge a strong hope that the event will at length prove favourable to our interest.

FACTUM, [Lat.] in arithmetic, the product of two quantities multiplied by each other.

FACTURE, [French,] the act or manner of making any thing.

FACULÆ, [Lat. from *fax*, a torch,] in astronomy, a name given by Scheiner and others, to certain bright spots on the sun's disk, that appear more lucid than the rest of his body. Hevelius affirms, that on July 20, 1634, he observed a facula, whose breadth was equal to one-third of the sun's diameter. Kircher, Scheiner, and others, represent the sun's body, as full of these faculae; which they suppose to be volcanos; and others contend, that the maculae change into faculae before they disappear. But Huygens and others of the latest and best observers, finding that the best telescopes discover nothing of the matter, agree entirely to explode the phenomena of faculae; and attribute the cause of these appearances to the tremulous agitation of the vapours near our earth. Dr. Hutton concludes that "the faculae are not eruptions of fire and flame, but refractions of the sun's rays in the rarer exhalations, which, being condensed, seem to exhibit a light greater than that of the sun." Math. Dict. vol. i. p. 466.

FACULTY, a term used to denote the powers of the human mind, viz. understanding, will, memory, and imagination. See **UNDERSTANDING** and **METAPHYSICS**.

FACULTY, in law, a privilege granted to a person, by favour and indulgence, of doing what, by law, he ought not to do. For granting these privileges, there is a court under the archbishop of Canterbury, called the court of the faculties. The chief officer of this court is styled master of the faculties, and has a power of granting dispensations in divers cases; as, to marry without the bans being first published, to eat flesh on days prohibited, to ordain a deacon under age, for a son to succeed his father in his benefice, a clerk to hold two or more livings, &c.

FACULTY, in the schools, a term applied to the different members of an university, divided according to the arts and sciences taught there: thus in most universities there are four faculties, viz. 1. Of arts, which include humanity and philosophy. 2. Of theology. 3. Of physic. And, 4. Of civil law. The degrees in the several faculties in our universities are those of bachelor, master, and doctor.

VOL II.—NO. 79.

FACULTY OF ADVOCATES, a term applied to the college or society of advocates in Scotland, who plead in all actions before the court of session. They meet in the beginning of every year, and choose the annual officers of the society, viz. dean, treasurer, clerks, private and public examiners, and a curator of their library.

FACES, in chemistry, settlings after distillation and infusion. The faces of wine are commonly called lees.

FACES. See **FECES**.

FÆCULA, in chemistry, the substance obtained by bruising or grinding certain vegetables, or grain, in water; the fæcula is that part which after standing some time falls to the bottom; this, in plants, appears to be only a slight alteration of their mucilage, for it differs from mucilage in no other respect than in being insoluble in cold water. Most plants contain fæcula, but the seeds of gramineous and leguminous vegetables, and all tuberos roots, contain it in great abundance.

FAENSA, FAENZA, or FAYENCE, a fortified city of Italy, in Romagna, anciently called Faventia. It is 12 miles S. W. of Ravenna.

FAGARA, IRON-WOOD; a genus of the monogynia order and tetrandria class of plants; natural order, *Dumosa*. Calyx quadrifid; corolla tetrapetalous; capsule bivalved, monospermous. There are ten species, natives chiefly of the warm parts of America, rising with woody stems more than 20 feet high.

FAGG, in the sea language, a term given to the end of those stands which do not go through the tops, when a cable or rope is closed.

FAGONIA, in botany, a genus of the monogynia order, and decandria class of plants; natural order, *Gruinales*. Calyx five-leaved; petals five, cordate; capsula five-celled, ten-valved, with one seed in each cell. There are three species; natives of Spain, Crete, and Arabia.

FAGOT, in times of popery, was a badge worn on the sleeve of the upper garment of such persons as had abjured what was then termed heresy; being put on after the person had carried a fagot, by way of penance, to some appointed place of solemnity. The leaving off the wear of this badge was sometimes interpreted a sign of apostasy.

FAGOTS, among military men persons hired by officers, whose companies are not full, to muster and hide the deficiencies of the company; by which means they cheat the king of so much money.

FAGREA, a genus of the class and order pentandria monogynia. Calyx bell-shaped; corolla funnel-shaped; berry two-celled, fleshy; seeds globular; stigma peltate. One species, a shrub of Ceylon.

FAGUS, BEECH TREE: a genus of the polyandria order, and monœcia class of plants; natural order, *Amentacea*. Male, calyx five-cleft, bell-shaped; corolla none; stamina twelve; female, calyx four-toothed; corolla none; styles three; capsule muciculate, four-valved; seeds two. There are five species, viz. two chestnut trees, and three of the beech, one of which is a native of Cochinchina. The chestnut tree will thrive upon almost any soil which lies out of the water's way; but disaffects wet moorish land. It sometimes grows to an immense size. The largest in the known world are those which grow upon Mount Ætna in Sicily. At Tortworth in Gloucestershire, is a chestnut-tree 52 feet round. It is proved to have stood there ever since 1150, and was then so remarkable that it was called the great chestnut of Tortworth. It fixes the boundary of the manor, and is probably near 1000 years old. As an ornamental, the chestnut is well worthy the gardener's attention. Its uses have been highly extolled. As a substitute for the oak, it is preferable to the elm: for door-jambs, window-frames, and some other purposes, it is nearly equal to oak itself; but there is a deceitful brittleness in it which renders it unsafe to be used in beams, or in any other situation where an uncertain load is required to be born. It is excellent for liquor casks; not being liable to shrink, nor to change the colour of the liquor: it is also recommended as an underwood for hop-poles, stakes, &c. Its fruit too is valuable, not only for swine and deer, but as a human food: Bread is said to have been made of it.

FAHALFAHARA, a town of Persia, in the province of Meccran, 100 miles N. W. of Kidge.

FAHEU, one of the New Philippine islands.

FAHLUN, a town of Sweden, capital of Dalecarlia. It is 30 miles N. W. of Hedemora.

4 Z

FAHRAC,

FAHRAG, a town of Persia, in the province of Farsistan, 180 miles N. E. of Schiras.

FAILLIS, in heraldry, a French term denoting some failure or fraction in an ordinary, as if it were broken, or a splinter taken from it.

FAILURE, a species of bankruptcy, commonly called breaking, or stopping payments. See **BANKRUPTCY**.

FAILURE OF RECORD, in law, is where an action is brought against a person, who alleges, in his plea, matter of record in bar of the action, and avers to prove it by the record; to which the plaintiff replies, *Nul tiel record*, viz. There is no such record: whereupon the defendant has a day given him by the court to bring it in; and if he fail to do it, he is then said to fail of his record, and the plaintiff shall thereon have judgement.

FAINT ACTION, in law, a feigned action, or such as, although the words of the writ are true, yet, for certain causes, the plaintiff has no title to recover thereby.

FAINT PLEADER, in law, a covinous, false, or collusory manner of pleading, to the deceit of a third person.

FAINTS, in the distillery, the weak spirituous liquor that runs from the still in rectifying the low wines after the proof spirit is taken off. Faints are also the last runnings of all spirits distilled by the alembic. The clearing of the worm of these is so essential a point in order to the obtaining of a pure spirit by the subsequent distillation, that all others are fruitless without it.

FAIR, in sea language, is used for the disposition of the wind, when it is favourable to a ship's course, in opposition to that which is contrary or foul. The term fair is more comprehensive than large, and includes about 16 or 18 points in the compass; whereas large is confined to the beam quarter, that is, to a wind which crosses the keel at right angles, or obliquely from the stern, but never to one right a-stern.

FAIR CURVE, is a winding line used in delineating ships, whose shape is varied, according to the part of the ship which it is intended to describe.

FAIR WAY, in sea language, the path or channel of a narrow bay, river, or haven, in which ships usually advance in their passage up and down; so that if any vessels are anchored therein, they are said to lie in the fair way.

FAIR, a greater kind of market, granted to a town, by privilege, for the more speedy and commodious providing of such things as the place stands in need of. It is derived from the French word *foire*, which signifies the same thing; and *foire* is by some derived from the Latin *forum*, market; by others from the Latin *feria*, because anciently fairs were always held in the places where the *feria* were held. See **FERIE**. Fairs are granted to towns by privilege, for the more speedy supplying of whatever they need. It is one privilege of a fair, that persons shall be free from being arrested in it for any other debt or contract than what was contracted in the same, or at least promised to be paid there. Fairs are generally kept once or twice a-year; and, by statute, they shall not be held longer than they ought, by the lords thereof, on pain of their being seized into the king's own hands, &c. Also proclamation is to be made, how long they are to continue; and no person shall sell any goods after the time of the fair is ended, on forfeiture of double value, one-fourth to the prosecutor and the rest to the king. There is a toll usually paid in fairs on the sale of things, and for stallage, pittance, &c. Fairs abroad are either free, or charged with toll and impost. The privileges of free fairs consist chiefly, first, in that all traders, &c. whether natives or foreigners, are allowed to enter the kingdom, and are under the royal protection, exempt from duties, impositions, tolls, &c. Secondly, that merchants, in going or returning, cannot be molested or arrested, or their goods stopped. They are established by letters patent from the prince. Fairs, particularly free fairs, are of great importance in the commerce of Europe, especially in that of the Mediterranean, and inland parts of Germany, &c. The principal fairs of America are the fairs of Porto-bello, Vera Cruz, and the Havanna, all of which are of very considerable consequence. The two first last as long as the flota, and galleons continue in those parts; and the last is opened as soon as the flota or galleons arrive there upon their return for Spain; this being the place where the two fleets join. The chief British fairs are, 1. Sturbridge fair, near Cambridge, is by far the greatest in Britain, and perhaps in the world. 2. Bristol has two fairs, very near as great as that of Sturbridge. 3. Exeter. 4. West Chester. 5. Edinburgh. 6. Wheyhill; and 7. Burford

fair; both for sheep. 8. Pancras, in Staffordshire, for saddle horses. 9. Bartholomew fair, at London, for Welsh black cattle. 10. St. Faith's, in Norfolk, for Scotch runts. 11. Yarmouth fishing fair for herrings, the only fishing fair in Great Britain. 12. Ipswich butter fair. 13. Woodborough hill in Dorsetshire, for west country manufactures, as kerseys, druggets, &c. 14. Two cheese fairs at Chipping Norton. 15. There are eight fairs in Perth; and, 16. A great cattle fair at Falkirk; besides innumerable other fairs, throughout the island, for all sorts of goods. Among the principal free fairs in France were those of St. Germain, Lyons, Rheims, Chartres, Rouen, Bourdeaux, Troyes, Bayonne, Dieppe, &c. The most noted fairs in Germany are those of Frankfort, Leipsic, and Nuremberg; not only on account of the great trade, but the vast concourse of princes of the empire, nobility, and people, who come to them from all parts of Germany to partake of the diversions.

FAIR ISLE, or **FARO**, a small island lying between Orkney and Shetland, 30 miles E. N. E. from the former; and 24 S. W. from the latter. It is above three miles long, and nearly two broad.

FAIRFAX, a county of Virginia, on the W. banks of the Potomac, 25 miles long and 18 broad. The chief town is Alexandria.

FAIRFIELD, a populous maritime county of Connecticut, bordering on the State of New York.

FAIRFIELD, the capital of the above county, called Unquowa by the Indians, is seated on the Mill-run, a little above its influx into Long Island Sound.

FAIRFORD, a town in Gloucestershire, remarkable for its church, which has curious painted glass windows. They represent the most remarkable histories in the Old and New Testament. The painter was Albert Durer. It is 25 miles E. of Gloucester.

FAIR WEATHER CAPE, a cape on the E. coast of Patagonia. Lon. 68. 10. W. Lat. 51. 45. S.

FAIRY, [*ferkth*, Saxon; *fee* Fr. ab *ega*, terra, fit & *pegu* Macedonum dialecto; unde *εργος υπεργος*, & Romanis *inferi*, qui Scoto Saxonibus dicuntur *feries*, nostratij; vulgo corruptius *fairies*, *narax*, *feries* *dauphinois*, sive *dii manes*. Baxter's Glossary.] a kind of fabled beings supposed to appear in a diminutive human form, and to dance in the meadows, and reward cleanliness in houses; an elf; a fay. Fairies were most usually imagined to be women of an order superior to human nature, yet subject to wants, passions, accidents, and even death; sprightly and benevolent while young and handsome; morose, peevish, and malignant, if ugly, or in the decline of their beauty; fond of appearing in white, whence they are often called the white ladies. Jervaise of Tilleberry, marshal of the kingdom of Arles, who lived in the beginning of the 13th century, writes thus concerning them, in a work inscribed to the emperor Otho IV. "It has been asserted by persons of unexceptionable credit, that fairies used to choose themselves gallants from among men, and rewarded their attachment with an affluence of worldly goods; but if they married, or boasted of a fairy's favours, they as severely smarted for such indiscretion." This idea of fairies has a near affinity with that of the Greeks and Romans, concerning the nymphs of the woods, mountains, rivers, and springs; and an ancient scholiast on Theocritus says, "The nymphs are demons which appear on the mountains in the figure of women." The Arabs and other orientals have also their *ginn* and *peri*, of whom they entertain the like notions.

FAIRY CIRCLE, or **RING**, a phenomenon pretty frequent in the fields, &c. long supposed to be traced by the fairies in their dances. There are two kinds of it; one of about seven yards in diameter, containing a round bare path, a foot broad, with green grass in the middle of it. The other is of a different bigness, encompassed with a circumference of grass. Some suppose these circles to be made by ants, which are often found in great numbers in them. Messrs. Jessop and Walker, in the Philosophical Transactions, ascribe them to lightning; which is thought to be confirmed by their being most frequently produced after storms of that kind, as well as by the colour and brittleness of the grass roots when first observed. Lightning, like all other fires, moves round, and burns more in the extremity than in the middle: the second circle arises from the first, the grass burnt up growing very plentifully afterwards. Mr. Cavallo, however, in his valuable Treatise on Electricity, does not think that lightning is concerned in the formation of them: "They are not (says he) always of a circular figure; and, as I am informed, they seem to be rather beds of mushrooms than the effects of lightning." Dr. Wollaston has, in a late volume of

the "Transactions of the Royal Society," given a new and very ingenious theory. That which first attracted his notice was the position of certain fungi which are always found growing upon these circles, if examined in a proper season. He was induced from the position of these fungi to imagine that the progressive increase from a central point was the probable mode of formation of the ring: hence he conjectured that the soil, which had once contributed to the support of the fungi, might be so exhausted of some peculiar pabulum necessary for their production as to be rendered incapable of producing a second crop. Hence the second year's crop would appear in a small ring surrounding the original centre of vegetation, and at every succeeding year the defect of nutriment on one side would necessarily cause the new roots to extend themselves solely in the opposite direction, and would occasion the circle of fungi continually to proceed, by an annual enlargement, from the centre outwards. An appearance of luxuriance of the grass would follow as a natural consequence, as the soil of an interior circle would always be enriched by the decayed roots of fungi of the year's growth. This theory is supported by some observations of Dr. Withering; and Dr. Wollaston says, by way of confirmation, that whenever two adjacent circles are found to interfere, they not only do not cross each other, but both circles are invariably obliterated between the points of contact: the exhaustion occasioned by each obstructs the progress of the other, and both are starved. Phil. Trans. 1807, Part II.

FAITH, [*foi*, French; *fede*, Italian; *fides*, Latin,] in philosophy, is that assent which we give to a proposition advanced by another, the truth of which we do not immediately perceive from our own reason or experience; or it is that judgement or assent of the mind, the motive whereof is not any intrinsic evidence but the authority and testimony of some other who reveals or relates it. Hence, as there are two kinds of authorities and testimonies, the one of God, and the other of man, faith becomes distinguished into divine and human:

1. **FAITH, DIVINE**, is that founded on the authority of God; or that assent we give to what is revealed by God. The objects of this faith, therefore, are matters of revelation. See **REVELATION** and **RELIGION**.

2. **FAITH, HUMAN**, is that whereby we believe what is told us by men. The object hereof is matter of human testimony and evidence. See **METAPHYSICS**.

FAITH, in practical theology and Christianity, is the first of theological virtues or graces. Faith in God, in this sense, denotes such a conviction of his being, perfections, character, and government, as produces love, trust, worship, obedience, and resignation. Faith by divines is generally distinguished into four sorts viz. historical, temporary, the faith of miracles, and justifying or saving faith. 1. Historical, whereby we assent to the truths of revelation, as a kind of certain and infallible record: this, when without works, is dead *Jam. 2. 17*; of this kind is the faith of devils *Jam. 2. 19*. 2. A temporary faith, whereby, with some degree of affection we receive divine truths as both certain and good; but soon after lose the whole impression, since they were never rooted in the heart: such is the faith of the gospel-hearers, who are compared to stony ground, *Matth. 11. 24*. 3. The faith of miracles whereby, from a divine impression, one is persuaded that God will work such a particular miracle by his means, or upon his person; a faith to remove mountains is of the first kind, and faith to be healed is of the last, *1 Cor. 13. 2. Acts 14. 9*. 4. Saving or justifying faith is a saving grace wrought in the soul by the Spirit of God, whereby we cordially receive Christ, as he is offered in the gospel, to be our prophet, priest, and king. By this we, on the testimony of God's word, and through the operation of his Spirit, believe, that is, are fully persuaded, and conscious to ourselves, that we are utterly sinful, lost, and undone, without Jesus Christ. Hence this exercise of faith renders sin, or the transgression of the law of God, exceedingly odious, makes us feel the burden of our past offences to be intolerable, and instigates us earnestly to seek relief. It is to those, who are thus affected, that the Redeemer of men gives the kind invitation, "Come unto me all ye that labour, and are heavy laden, and I will give you rest," *Mat. 11. 28*. He is a partaker of saving faith, or is a true believer, who on the testimony of Christ, and on other similar testimony, found in the word of God, and through the influence of the divine Spirit, ventures on the atonement of Christ, that is, receives Christ in his priestly office, and having

intirely renounced every idea of merit in himself, he depends altogether on the merits of Jesus Christ, whom he now acknowledges as his lord and master. It is this degree of faith which is properly called saving or justifying faith, for, to come to Christ, as expressed in the above passage, plainly means to depend and rely fully on him, and he that does this assuredly finds, because God is true, the rest promised, or deliverance from this load of sin; that is, his sins are remitted, or he is justified before God. Since the subject of this article is one of the most important in the whole compass of science, we conceive it will not be improper to present a few additional observations. 1. Since he that has faith receives Christ as his prophet or teacher, he, as a disciple or scholar, attends to the heavenly instruction of his divine master; he hearkens to his precepts, follows his example, seeks to attain his temper and disposition, and sets himself to do the will of God, and to observe all his directions. And the more cordially he does this the stronger is his faith. 2. Since he that has faith, receives Christ as his priest, he, as a sinful, polluted creature, having no merit, nothing to recommend him to God's favour, relies wholly on the merits of Christ, and this being in acquiescence with the will, direction, and purpose of God, he obtains, as a free gift, the pardon of his sins, and the approbation of the Divine Being, who accepts of the merits of Christ on his account. The more cordially a man relies on Christ, the stronger is his faith, and the larger measure does he obtain of God's favour, for it is done unto him according to his faith. And here it may be observed that it is not for his faith, but by his faith, that the believer obtains this most valuable of all blessings. Faith is not the meritorious cause, but the instrument by which we receive the heavenly treasure into earthen vessels. 3. Since he who has faith receives Christ as his king, he, as a willing subject, pays ready obedience to all his laws and ordinances, confides in him for the supply of all his wants, and for protection from all his enemies, employs himself in supporting the cause of Christ, and opposes under the standard of his king, the powers of the world, the flesh, and the devil, and it is in consequence of his faith in Christ that he gains the conquest, *1 John 5. 4*. "and this is the victory that overcometh the world even our faith." But though, by faith we are made to understand divine things, are rendered acceptable to God, are made to bear the fruits of righteousness, and empowered to conquer our spiritual enemies, yet we have nothing to boast of, for boasting is excluded by the law of faith, *Rom. 3. 27*. The reason is that faith is not the meritorious but the instrumental cause of the blessings which the believer obtains. If a prince beholding a rebel reduced to a state of the utmost misery, and totally unable to extricate himself, should offer him pardon, protection, and every thing calculated to make him happy, on condition he would come to him in the way he had directed, and accept of his favour. If this man do not lend his ear to the voice of the prince he cannot obtain the only thing which could make him happy; but if he do lend his ear does he therefore merit the pardon, &c.? If he do not come to the prince in the way directed he cannot receive the bounty; but if he do use his feet to come, does he by that merit the kindness bestowed upon him? In like manner if he stretch out his hand to receive any particular gift, does he by that act, merit the gift? Thus faith is the ear by which we attend to the voice of Christ, and hear the offers of grace, and lessons of heavenly wisdom directing the way in which we should proceed. But it is plain, that faith does not merit any part of the boundless mercy which that celestial voice proclaims. Again faith is the feet by which we come to Christ, and move in the path of duty; but this faith or exercise of faith, does not merit the blessing, which by this means we enjoy. Also faith is the hand which takes of the things of Christ and shews them to us, or makes them our own, but it does not on this account merit them. And all the good works, that a man does acceptably to God, being properly acts of faith, cannot have merit in them, but are only the instrumental means by which we come to God, and receive the free gift of his favour. Therefore boasting is excluded by the law of faith. Faith is said to be of the operation of the Spirit of God, because that Spirit is the author and finisher of it; it is said to work by love, because in receiving divine things it attaches the mind to the giver, and hence fixes in the soul the principle of love; it is said to purify the heart, because it receives the atonement which removes our sins, and is that exercise of our duty in which righteousness consists. The Apostle observes, that "faith is the substance of things hoped for,

for, the evidence of things not seen, *Heb.* 11. 1. And this it is because it realizes spiritual things to the mind. Faith is the gift of God, and St. James, denoting it by the very significant appellation *wisdom*, says, "if any of you lack wisdom, let him ask of God, that giveth to all men liberally, and upbraideth not; and it shall be given to him," *Jam.* 1. 5. We earnestly entreat our readers above all things to secure this wisdom; it is this which diffuses the soul of happiness throughout the whole compass of our pursuits and actions.

FAKENHAM, a town of Norfolk, 6 miles from the sea-coast, and 20 N. W. of Norwich.

FAKIRS, Indian monks or friars. They outdo the severity and mortification of the ancient Anchorets. Some of them make a vow of continuing all their lifetime in one posture, and keep it effectually. Others never lie down; but continue in a standing posture all their lives, supported only by a stick, or rope under their arm-pits. Some mangle their bodies with scourges and knives. They pretend to have conquered every passion, and triumphed over the world; and accordingly scruple not, as if in a state of innocence, to appear entirely naked in public. The people of East India are persuaded of the virtue of the fakirs; notwithstanding which, they are accused of committing the most enormous crimes in private. There is also another kind of fakirs, who do not practise such severities; these flock together, and go from village to village, prophesying, and telling fortunes. They are wicked villains, and it is dangerous to meet them in a solitary place; nevertheless the Indian idolaters have them in the utmost veneration.

FALAISE, a town of France, in the department of Calvados, and late province of Normandy, with a castle, one of the finest towers in France; famous for being the birth-place of William the Conqueror. It is 20 miles S. E. of Caen.

FALASHA, a people of Abyssinia, of Jewish origin, described by Mr. Bruce, who was at great pains to acquaint himself with their history, by cultivating the friendship of the most learned persons among them. They say, that the first book of Scripture they ever received was that of Enoch; and they place that of Job immediately after it, supposing that patriarch to have lived soon after the flood. They have no copy of the Old Testament in the Falasha language, what they make use of being in that of Geez. This is sold to them by the Abyssinian Christians, who are the only scribes in that country. No difference takes place about corruptions of the text; nor do the Falasha know any thing of the Jewish Talmud, Targum, or Cabala.

FALCADE, in the manege, the motion of a horse when he throws himself upon his haunches two or three times, as in very quick carvets; which is done in forming a stop and half stop.

FALCATED, something in the form of a sickle: thus, the moon is said to be falcated when she appears horned.

FALCO, in ornithology, a genus of birds, of the order Accipitres. The characters are these: bill hooked at the end, covered at its base with a cere, or naked membranous skin; head covered with feathers, which lie close on each other: tongue often cleft. This is a rapacious carnivorous race of animals, feeding almost entirely on animal food; they are very quick-sighted, generally fly high, and build their nests in lofty places. They are not gregarious; and the females are generally larger than the males. The legs and feet are scaly; the claws large, strong, very sharp, and much hooked. There are about 100 species, with several varieties. Dr. Gmelin divides this genus into four sub-genera, or lesser divisions; which Mr. Kerr has reduced to three, by including the *Gypatus Serpentarius*, in his 2d subgenus, because it has some relation to the vultures. These three subgenera are, 1. *Gypati*, Bastard Eagles; 2. *Aquilæ*, Eagles; and 3. *Falcones*, Falcons and Hawks.

F. AQUILA CHRYSÆTOS, the **GOLDEN EAGLE**, weighs about 12lb. and is about three feet long, the wings when extended measuring seven feet 4 inches. The sight and sense of smelling are very acute: the head and neck are clothed with narrow, sharp-pointed feathers, of a deep brown colour bordered with tawney; the hind part of the head is of a bright rust colour. These birds are very destructive to fawns, lambs, kids, and all kinds of game; particularly in the breeding season, when they bring a vast quantity of prey to their young. Smith, in his History of Kerry, relates, that a poor man in that country got a comfortable subsistence,

for his family, during a summer of famine, out of an eagle's nest, by robbing the eaglets of the food the old ones brought; whose attendance protracted beyond the natural time, by clipping the wings and retarding the flight of the former. It is very unsafe to leave infants in places where eagles frequent; there being instances in Scotland of two being carried off by them; but, fortunately, the thefts were discovered in time, and the children were restored unhurt out of the eagles nests. In order to extirpate these pernicious birds, there is a law in the Orkney isles, which entitles every person that kills an eagle to a hen out of every house in the parish where it was killed. Eagles seem to give the preference to the carcasses of dogs and cats. People who make it their business to kill those birds, lay one of these carcasses by way of bait; and then conceal themselves within gun-shot. They fire the instant the eagle alights; for she, that moment, looks about before she begins to prey. Yet, quick as her sight may be, her sense of hearing seems still more exquisite. If hooded crows or ravens happen to be nearer the carrion, and resort to it first, and give a single croak, the eagle instantly repairs to the spot. These eagles are remarkable for their longevity, and for sustaining a long abstinence from food. Mr. Keyster relates, that an eagle died at Vienna after a confinement of 104 years. This pre-eminent length of days is alluded to by the Psalmist, "Thy youth is renewed like the eagle's." One of this species, which was nine years in the possession of Owen Holland, Esq. of Conway, lived 32 years with the gentleman who made him a present of it; but what its age was, when the latter received it from Ireland, is unknown. The same bird also furnishes us with a proof of the truth of the other remark; having once, through the neglect of servants, endured hunger for 21 days without any sustenance whatever. See Plate LVIII.

F. HALIÆTUS, or the **OSPREY**, is to be found in almost all parts of Europe, on the borders of lakes and rivers, which it frequents for the sake of the fish contained in them, which constitute its principal subsistence, and on which it darts with unerring accuracy; it builds on the ground among reeds, and is the most numerous of the larger birds of prey.

F. BUTEO, or the **COMMON BUZZARD**, is abundantly provided with means of defence, as well as attack; but is sluggish and cowardly with all its strength, and will suffer itself to be brought to the ground by a sparrow-hawk, without at all employing those means, which, if fully exerted, would uniformly and inevitably prove fatal to the assailant. The length of the common buzzard is about 20 inches; its food consists of birds, vermin, reptiles, and insects.

F. AQUILA MILVUS, the **KITE**, is a native of Europe, Asia, and Africa. This species generally breeds in large forests or woody mountainous countries. Its nest is composed of sticks, lined with several odd materials, such as rags, bits of flannel, ropes, and paper. They are white, spotted with dirty yellow. Its motion in the air distinguishes it from all other birds, being so smooth and even that it is scarce perceptible. Sometimes it will remain quite motionless for a considerable space; at others glide through the sky without the least apparent action of its wings; from thence deriving the old name of Glade, from the Saxon glida. They inhabit the N. of Europe, as high as Jarlsberg, in the S. of Norway; but do not extend farther. They are observed in vast numbers about Cairo, where they are extremely tame, and feed even on dates, probably for want of other food. They appear in Greece in the spring. In Britain they are found the whole year. Lord Bacon observes, that when kites fly high, it portends fair and dry weather. Mr. Kerr enumerates three varieties of this species, viz. the Siberian, Russian, and Jaic Kites.

F. OSSIFRAGUS, the **OSPREY**, or **SEA-EAGLE**, frequents the sea-shore, and subsists principally upon fish; it is nearly of the size of the golden eagle, and is found in many countries both of Europe and America; its sight is stated to be equally clear by night and by day. Mr. Barlow relates, that he saw a bird of this species engaged once in a violent conflict in the air with a cat which he had lifted in his talons, whose efforts, however, were finally too powerful for him, and brought him again to the ground. Martin, speaking of the great eagles of the Western Isles, says, that they fasten their talons in the back of the fish, commonly salmon, which are often above the water, or very near the surface. Those of Greenland will even take a young seal out of the water. It also

preys on water fowl. This species is frequent in North America, and was met with in Botany Island by Captain Cook. See Plate LVIII.

FALCONARA, an island in the Grecian Archipelago. See **FALCONRY**.

FALCONRY, the exercise of taking wild-fowl by means of hawks. The primeval Britons, with a fondness for the exercise of hunting, had also a taste for that of hawking; and every chief among them maintained a considerable number of birds for that sport. To the Romans this diversion was scarcely known in the days of Vespasian; yet it was introduced immediately afterwards. Most probably they adopted it from the Britons; but we certainly know that they greatly improved it by the introduction of spaniels into the island. In this state it appears among the Roman Britons in the sixth century. In after-times, hawking was the principal amusement of the English: a person of rank scarcely stirred out without his hawk on his hand; which, in old paintings, is almost the criterion of nobility. Harold, afterwards king of England, when he went on a most important embassy into Normandy, is painted embarking with a bird on his finger, and a dog under his arm: and in an ancient picture of the nuptials of Henry VI. a nobleman is represented in much the same manner; for in those days, "it was thought sufficient for noblemen to wind their horn, and to carry their hawk fair, and leave study and learning to the children of mean people." The expence was great that sometimes attended this sport. In the reign of James I. Sir Thomas Monson is said to have given 1000*l.* for a cast of hawks: we are not then to wonder at the rigour of the laws that tended to preserve a pleasure which was carried to such an extravagant pitch. In the 34th of Edward III. it was made felony to steal a hawk; to take its eggs, even in a person's own ground, was punishable with imprisonment for a year and a day, besides a fine at the king's pleasure: in queen Elizabeth's reign, the imprisonment was reduced to three months; but the offender was to find security for his good behaviour for seven years, or lie in prison till he did. The falcons or hawks that were in use in these kingdoms are now found to breed in Wales, and in North Britain and its isles. The peregrine-falcon inhabits the rocks of Caernarvonshire. The same species, with the gyr-falcon, the gentil, and the gos-hawk, are found in Scotland, and the lanner in Ireland. We may here take notice, that the Norwegian breed was, in old times, in high esteem in England: they were thought bribes worthy a king. Jeoffrey Fitz-pierre gave two good Norway hawks to king John, to obtain for his friend the liberty of exporting 100 cwt. of cheese; and Nicholas the Dane was to give the king a hawk every time he came into England, for the liberty to traffic throughout the king's dominions. Falconry, though an exercise now much disused among us, yet furnishes a great variety of significant terms, which still obtain in our language. Thus, the parts of a hawk have their proper names. The legs from the thigh to the foot, are called arms; the toes the petty singles; the claws the pounces. The wings are called the sails; the long feathers the beams; the two longest, the principal feathers; those next, the flags. The tail is called the train; the breast-feathers the mails; those behind the thigh the pendant feathers. When the feathers are not yet full-grown she is said to be unsummed; when they are complete, she is summed: the craw, or crop, is called the gorge; the pipe next the fundament, where the faeces are drawn down, is called the pannel: the slimy substance lying in the pannel is called the glut: the upper and crooked part of the bill is called the beak; the nether part, the clap; the yellow part between the beak and the eyes, the sear or sere; the two small holes therein, the nares. As to her furniture: the leathers with bells buttoned on her legs, are called bewits. The leathern thong, whereby the falconer holds the hawk, is called the lease or lash; the little straps, by which the lease is fastened to the legs, jesses; and a line or packthread fastened to the lease, in disciplining her, a creance. A cover for her head, to keep her in the dark, is called a hood; a large wide hood, open behind, to be worn at first, is called a ruffer-hood: to draw the strings, that the hood may be in readiness to be pulled off, is called unstriking the hood. The blinding of a hawk just taken, by running a thread through her eye-lids, and thus drawing them over the eyes, to prepare her for being hooded, is called seeling. A figure or resemblance of a fowl, made of leather and feathers, is called a lure. Her resting place, when off the falconer's hand, is called the

perch. The place where her meat is laid, is called the hack; and that wherein she is set while her feathers fall and come again, the mew. Something given a hawk to cleanse and purge her gorge, is called casting. Small feathers given her to make her cast, are called plumage. Gravel given her to help to bring down her stomach is called rangle. Her throwing up filth from the gorge after casting is called gleaming. The purging of her grease, &c. en-seaming. Her being stuffed is called gurgiting. The inserting a feather in her wing in lieu of a broken one is called imping. The giving her a leg, wing, or pinion, of a fowl to pull at, is called tiring. The neck of a bird the hawk preys on is called the inke. What the hawk leaves of her prey is called the pill, or pelf. There are also proper terms used for several actions. When she flutters with her wings, as if striving to get away, either from the perch or fist, she is said to bate. When, standing too near, they fight with each other, it is called crabbing. When the young ones quiver, and shake their wings in obedience to the elder, it is called cowering. When she wipes her beak after feeding, she is said to feak. When she sleeps, she is said to jouk. From the time of exchanging her coat till she turn white again, is called her inter-mewing. Treading is called cawking. When she stretches one of her wings after her legs, and then the other, it is called mantling. Her dung is called muting; when she mutes a good way from her, she is said to slice; when she does it directly down, instead of jerking backwards, she is said to slime; and if it be in drops, it is called dropping. When she sneezes, it is called snit-ing. When she raises and shakes herself, she is said to rouze. When, after mantling, she crosses her wings together over her back, she is said to warble. When a hawk seizes she is said to bind. When, after seizing, she pulls off the feathers she is said to plume. When she raises a fowl aloft, and at length descends with it to the ground, it is called trussing. When being aloft, she descends to strike her, then it is called stooping. When she flies or keeps far from game, she is said to rake. When, forsaking her proper game, she flies at pyes, crows, &c. that chance to cross her, it is called the check. When, missing her prey, she betakes herself to the next check, she is said to fly on head. The fowl or game she flies at is called the quarry. The dead body of a fowl killed by the hawk, is called a pelt. When she flies away with the quarry, she is said to carry. When in stooping she turns two or three times on the wing, to recover herself ere she seizes, it is called canceliering. When she hits the prey, yet does not truss it, it is called ruff. The making of a hawk tame and gentle is called reclaiming. The bringing of her to endure company, manning her. An old staunch hawk, used to fly and set example to a young one, is called a make hawk. The reclaiming, manning, and bringing up of a hawk to the sport, is not easy to be brought to any precise set of rules. It consists in a number of little practices and observances, calculated to familiarize the falconer to his bird, to procure the love of it, &c. When your hawk comes readily to the lure, a large pair of luring bells are to be put upon her; and the more giddy-headed and apt to rake out your hawk is, the larger must the bells be. Having done this, and she being sharp-set, ride out in a fair morning, into some large field unencumbered with trees or wood, with your hawk on your hand; then having loosened her hood, whistle softly to provoke her to fly; unhood her, and let her fly with her head into the wind; for by that means she will be the better able to get upon the wing, and will naturally climb upwards, flying a circle. After she has flown three or four turns, then lure her with your voice, casting the lure about your head, having first tied a pullet to it; and if your falcon come in and approach near you, cast out the lure into the wind, and if she stoop to it reward her. You will often find, that when she flies from the fist, she will take stand on the ground: this is a fault which is very common with soar-falcons. To remedy this, fright her up with your wand; and when you have forced her to take a turn or two, take her down to the lure and feed her. But if this does not do, then you must have in readiness a duck sealed, so that she may see no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the body; then lure with the voice, to make the falcon turn her head; and when she is at a reasonable pitch, cast your duck up just under her; when, if she strike, stoop, or truss the duck, permit her to kill it, and reward her by giving her a reasonable gorge. After you have practised this two or three times,

your hawk will leave the stand, and, delighted to be on the wing, will be very obedient. It is not convenient, for the first or second time, to shew your hawk a large fowl; for it frequently happens, that they escape from the hawk, and she, not recovering them, rakes after them: this gives the falconer trouble, and frequently occasions the loss of the hawk. But if she happen to pursue a fowl, and being unable to recover it, give it over, and come in again directly, then cast out a sealed duck: and if she stoop and truss it, across the wings, permit her to take her pleasure, rewarding her also with the heart, brains, tongue, and liver. But if you have not a quick duck, take her down with a dry lure, and let her plume, a pullet and feed upon it. By this means a hawk will learn to give over a fowl that rakes out, and, on hearing the falconer's lure, will make back again, and know the better how to hold in the head.

FALERII, in ancient geography, a town and territory of Etruria, on the W. or right side of the Tiber. The territory was famous for its rich pasture; hence the *gramen Faliscum* in authors.

FALERNUS AGER, a district at the foot of mount *Massicus* in Campania; famous for its generous wines; now called *Monte Massico*.

FALEZIN, a town of European Turkey, in Walachia, on the Pruth. Lon. 26. 49. E. Lat. 45. 15. N.

FALIN, a river of Chinese Tartary, which runs into the sea of Japan.

FALISCI, the people of *Falerii*, called *Æqui*, by Virgil, because they afforded supplemental laws to the XII Tables.

FALKENAU, a town of Bohemia, in the circle of Saatz, on the Eger; 66 miles W. of Prague.

FALKENBERG, a sea-port town of Sweden, in the province of Halland, on the Scaggerac, 52 miles N. of Helsingborg.

FALKENBURG, a town of Germany, in Brandenburg, six miles E. of Dramburg.

FALKENHAM, or **FALKINGHAM**, a town of Lincolnshire, 18 miles W. by S. of Boston.

FALKENSTEIN, a town of Germany, in the department of Mont Tonnerre; 24 miles W. of Worms.

FALKIA, a genus of the trigynia order, and hexandria class of plants. Calyx bell-shaped, five-cleft; corolla bell-shaped; stigmas orbicular, peltate; seeds four-angled. There is but one species, viz. *F. repens*, creeping *Falkia*.

FALKIRK, a town of Scotland, in Stirlingshire, chiefly supported by great fairs for black cattle from the Highlands; 24,000 head being annually sold there. It is 8 miles S. E. of Stirling, and 24 W. of Edinburgh.

FALKLAND, a town of Scotland, in Fifeshire, 15 miles N. of Edinburgh.

FALKLAND ISLANDS, a range of islands, at the utmost extremity of South America, not far from the Straits of Magellan. They were discovered by Sir Richard Hawkins in 1594. The soil is bad, and the shores are beaten by perpetual storms. Lon. between 50° and 56° W. Lat. from 51° to 53° S.

FALKLAND SOUND, a strait which separates the two largest of the Falkland islands.

FALKOPING, a town of Sweden in W. Gothland; 56 miles E. of Uddervalla.

FALL, in the sea-language, that part of the rope of a tackle, which is hauled upon. Also when a ship is under sail, and keeps not so near the wind as she should do, they say she falls off; or when a ship is not flush, but hath risings of some parts of her decks more than others, it is called falls.

FALL, the name of a measure of length used in Scotland, containing six ells.

FALL OF MAN, in sacred history, that awful event by which sin and death were introduced into the world. See *THEOLOGY*.

FALLACY, in philosophy, false appearance. The Epicureans deny that there is any such thing as a fallacy of the senses. According to them, all our sensations and perceptions, both of sense and phantasy, are true; whence they make sense the primary criterion of truth. The Cartesians, on the other hand, maintain, that we should suspect as false, or at most as dubious, every thing that presents itself to us by means only of the external senses, because they frequently deceive us; and that our senses, as being fallacious, were never given us by nature for the discovery of truth, or the contemplation of the principles of things; but only

for pointing out to us what things are convenient or hurtful to our bodies. The Peripatetics keep a middle course. They say, that if a sensible object be taken in its common or general view, the sense cannot be deceived about it; but that if the object be taken under its specific view, the sense may be mistaken about it, from the want of the dispositions necessary to a just sensation, as a disorder in the organ, or any thing uncommon in the medium: thus, in some disorders of the eye, all objects appear yellow; a stick in water appears broken or crooked, &c.

FALLAFAJEEA, one of the Friendly islands.

FALLING SICKNESS, the same with epilepsy. See *ME-DICINE*.

FALLING-STAR, in meteorology, a phenomenon that is frequently seen, and which has been usually supposed to depend on the electric fluid. Others conceive that they are rather to be attributed to falling stones. It is observable that when their appearance is frequent they have all the same direction; and it has been remarked that they are the forerunners of a westerly wind in our country. See *METEOR*.

FALLOPIAN TUBES, two canals of a tortuous figure, but approaching to a conic form, joined to the fundus of the uterus, one on each side. See *ANATOMY*.

FALLOPIUS, GABRIEL, a celebrated physician and anatomist, born at Modena, in 1523, and descended of a noble family. He made several discoveries in anatomy, one of which was that of the tubes, called from him the Fallopiian tubes. He travelled through the greatest part of Europe; was made professor of anatomy at Pisa, in 1548, and at Padua in 1551, where he died in 1562, aged 39. His writings, which are numerous, were first printed separately, and afterwards collected under the title of "*Opera genuina omnia, tam practica quam theoretica, in tres Tomos distributa.*" They were printed at Venice in 1585, and in 1606; at Frankfort in 1600, cum operum appendice; and in 1606, in folio.

FALLOWING, in agriculture, is the mode of preparing land, by ploughing it a considerable time before it is ploughed for seed. Lands are laid fallow either during the summer, or during the winter, according to the nature of the soil, and the judgement of the cultivator. Very able arguments have been alleged as well for, as against summer fallows, by skilful agriculturists. Both summer and winter fallows, however, are occasionally useful on different soils. The advantages to be derived from fallowing are: 1. By repeatedly turning soils over, much carbonic acid, or fixed air, is produced in a fluid state, which remains united with the vegetable rements, or with volatile alkali, or calcareous earth. 2. The parts of the soil become better incorporated, and thus reciprocally meliorated; so that they may afford more uniform nourishment to the roots of plants. 3. The pulverized soil is more easily penetrable, and thus exposes a greater surface of its cavities to the vegetable absorbents. 4. All unprofitable plants, or weeds, being thus eradicated, or continually ploughed under the soil, while yet young, a considerable proportion of vegetable nutriment will be reserved, and farther increased, by the saccharine and mucilaginous matter of the young vegetables buried by the plough. Lastly, some plants, during their herbaceous state, do not exhaust the ground on which they grow, before the seed-stems arise; as turnips, for instance, when pulled up, and carried away for the purpose of feeding cattle, or sheep, on other grounds. This benefit appears to arise from the soil being shaded by the thick foliage of those vegetables, and consequently meliorated; for its nutritious properties cannot have suffered by evaporation so much, as if the land had been exposed to the scorching influence of the sun. Dr. Darwin, when treating on this subject, justly observes, that, though a summer fallow may be of advantage to a poor soil, which has nothing to lose, yet it must be injurious to a rich one, which has nothing to gain. A fallow-cleansing machine was invented by a Mr. Aaron Ogden, a smith, at Ashton-under-Line, near Manchester. It consists of two large rollers, armed with iron spikes, to which the inventor prefixed a harrow so constructed, that it may be set to go to any depth in a furrow, without weighting; and will pulverize the soil, raise the roots, or weeds, to the surface, and at the same time not be obstructed by their accumulation, though it should raise as many weeds as would load a cart within the short space of five yards. There are several other pieces of machinery belonging to this implement; but as they are intricate, we refer the reader to the 3d vol. of the work, entitled "*Museum Rusti-*"

cum et Commerciale," where its parts are minutely described, and illustrated with a plate.

FALMOUTH, a port town of Cornwall, on a fine bay of the English channel, 10 miles S. of Truro. Lon. 4. 57. W. Lat. 50. 8. N. High water on the day of the change and full of the moon at thirty minutes past five in the afternoon.

FALMOUTH, a township of Antigua, on the S. shore.

FALMOUTH, a town of Jamaica, called also the Point, on the S. side of Martha Brae harbour.

FALMOUTH, a town of the United States, in the district of Maine, Cumberland county, seated on Casco Bay, 120 miles N. N. E. of Boston.

FALMOUTH, a town of Pennsylvania, in Lancaster county, 20 miles W. of Lancaster.

FALSE ACTION, if brought against one, whereby he is cast into prison, and dies pending the suit, the law gives no remedy in this case, because the truth or falsehood of the matter cannot appear before it is tried: and if the plaintiff is barred, or non-suited at common law, regularly all the punishment is amercement.

FALSE BAY, a bay lying E. of the Cape of Good Hope; frequented by vessels during the prevalence of the N. W. winds, which begin to blow in May, and render it dangerous to remain in Table Bay. Lon. 18. 33. E. Lat. 34. 10. S.

FALSE CAPE HORN, the S. W. point of Terra del Fuego.

FALSE IMPRISONMENT, is a trespass committed against a person, by arresting and imprisoning him without just cause, contrary to law; or where a man is unlawfully detained without legal process: and it is also used for a writ which is brought for this trespass. If a person be in any way unlawfully detained, it is false imprisonment; and considerable damages are recoverable in those actions.

FALSE NEWS, SPREADING OF, in order to make discord between the king and nobility, or concerning any great man of the realm, is punishable by common law with fine and imprisonment; which is confirmed by statutes Westm. 1. 3 Edw. 1. c. 34. 2 Rich. II. stat. 1. cap. 5. and 12 Rich. II. cap. 11.

FALSI CRIMEN, in the civil law, is fraudulent subornation or concealment, with design to darken or hide the truth, and make things appear otherwise than they are. The crimen falsi is committed, 1. By words, as when a witness swears falsely. 2. By writing, as when a man antedates a contract, or the like. 3. By deed, as when he sells by false weights and measures.

FALSIFYING A RECORD, signifies shewing it to be erroneous. Thus lawyers teach, that a person purchasing land of another, who is afterwards outlawed of felony, &c. may falsify the record, not only as to the time wherein the felony is supposed to have been committed, but also as to the point of the offence. But where a man is found guilty by verdict, a purchaser cannot falsify as to the offence; though he may for the time where the party is found guilty generally in the indictment, because the time is not material upon evidence.

FALSTER, a fertile island of Denmark, at the entrance of the Baltic, S. of Zealand, 60 miles in circumference. Nyekioping, and Stubbekioping, are the chief towns.

FALSTERBO, a sea-port town of Sweden, in the province of Schönon, 22 miles S. S. W. of Lund.

FALUGA, a town of Asiatic Turkey, in the Arabian Irak, 25 miles S. E. of Bagdad.

FALUGA, a small island near the W. coast of Sardinia, 12 miles S. of Cape Argentera.

FALX, in anatomy, a process of the dura mater placed between the two hemispheres of the brain, and resembling a reaper's sickle.

FAMA CLAMOSA, in the judicial procedure of the church of Scotland, a ground of action before a presbytery against one of its members, independent of any regular complaint by a particular accuser. Any person of a good character may give to the presbytery a complaint against one of their members; but the presbytery is not to proceed to the citation of the person accused, until the accuser under his hand gives in the complaint, with some account of its probability, and undertakes to make out the libel, under the pain of being considered as a slanderer. When such an accusation is brought before them, they are obliged candidly to examine the affair.

FAMACUSTA, or **FAMAGOSTA**, a city of Asiatic Turkey, on the E. coast of Cyprus, anciently called Fama Augusta. It is 28 miles W. of Tripoli in Syria.

FAME, in the heathen mythology, a goddess, celebrated

chiefly by the poets. She is feigned to have been the last of the race of Titans produced by the Earth, to have her palace in the air, and to have a vast number of eyes, ears, and tongues. She is mentioned by Hesiod, and particularly described by Ovid and Virgil.

FAMES CANINA, an excessive appetite. See **BULIMY**.

FAMIA, or **AFAMIA**, the modern name of one of the ancient Apameas.

FAMILIARS, in the Inquisition, persons who assist in apprehending such as are accused, and carrying them to prison. They are assistants to the inquisitor, and called familiars, because they belong to his family. In some provinces of Italy they are called cross-bearers, and in others the scholars of St. Peter the martyr; and they wear a cross before them on the outside garment. They are properly bailiffs of the inquisition; and the vile office is esteemed so honourable, that noblemen in Portugal have been ambitious of it. Nor is this surprising, when it is considered that Innocent III. granted very large indulgences and privileges to these familiars; and that the same plenary indulgence is granted by the pope to every single exercise of this office, as was granted by the Lateran council to those who succoured the Holy Land. When several persons are to be taken up at the same time, these familiars are commanded to order matters so, that they may know nothing of one another's being apprehended; and it is related, that a father, with his three sons, and three daughters, who lived together in the same house, were carried prisoners to the inquisition, without knowing any thing of one another's being there till seven years afterwards, when they that were alive were released by an act of faith.

FAMILY, [*familia*, Lat.] denotes the persons that live together in one house, under the direction of one head or chief manager. It also signifies the kindred or lineage of a person, and is used by old writers for a hide or portion of land sufficient to maintain one family.

FAMILY, in natural history, a term used by authors to express any order of animals, or other natural productions of the same class.

FAMILY LAKE, a lake of N. America. Lon. 93. 20. W. Lat. 52. 35. N.

FAMINE, or **FAMENE**, in geography, a territory in the W. part of the late duchy of Luxemburg; now included in the department of Forets. Marche and Roche are the chief towns.

FAMINE, PORT, a bay of South America, in the Straits of Magellan. Lon. 71. 26. W. Lat. 53. 43. S.

FAMINE, PORT, a fortress on the N. E. coast of Patagonia, where a Spanish garrison perished for want: whence the name of the fort and bay. Lon. 70. 20. W. Lat. 55. 44. S.

FAN, a well known contrivance employed chiefly by females to raise wind, cool the air by agitating it, and defend their complexion. This kind of toy was introduced into Britain from the East, where it is very generally used for shading the face from the sun, and guarding it against troublesome insects. Although the practice of fanning be sanctioned by fashion, it does not appear to be conducive to health, nor consistent with the operations of nature, because the evaporations of perspirable matter on the human skin has a greater tendency to cool the body, than the incessant fanning, wiping, and rubbing, of the face. Nevertheless fans may be useful for affording protection against the rays of the sun, for which purpose, however, parasols will be more convenient.

FAN is also an implement of husbandry employed in winnowing corn.

FANANO, a town of Modena, in Italy, 25 miles S. of Modena.

FANATICS, wild, enthusiastic visionary persons, who pretend to extraordinary revelation and inspiration, above what is written in the sacred scripture. The ancients called those *fanatici*, who passed their time in fana, temples, and being or pretending to be, often seized with a kind of enthusiasm, as if inspired by the divinity, shewed wild and antic gestures. Prudentius represents them as cutting and slashing their arms with knives. Shaking the head was also common among the *fanatici*; for Lampridius informs us, that the emperor Heliogabalus was arrived to that pitch of madness, as to shake his head with the gashed fanatics. Hence those who wish to throw an opprobrium on religion, have, with equal injustice and impropriety, applied the epithet to anabaptists, quakers, methodists, &c. The conduct of these people fully evince that

that they are not carried away by madmen's dreams, but soberly attend to the revelation of God, as delivered in the books of the Old and New Testament, and received by all Christians.

FANCY, [*φαντασία*], imagination, or the power by which the mind forms and represents to itself the images of objects. See **METAPHYSICS**.

FANGEAUX, a town of France, in the department of Aude, 8 miles S. E. of Castelnau-d'Aud.

FANIONS, in the military art, small flags carried along with the baggage.

FANO, a sea-port town of Italy, in the duchy of Urbino, anciently called Fanum Fortuna. It is seated on the Adriatic, 8 miles S. E. of Pesaro. Lat. 12° 59' 38" E. Lon. 43. 51. N.

FANOE, two small islands of Denmark; 1. in the Little Belt, 2 miles S. of Middelfart, in Funen; 2. in the German Ocean, on the coast of Sleswick, inhabited by fishermen. Lon. 8. 25. E. Lat. 55. 23. N.

FANSHAW, Sir RICHARD, famous for his embassies, was the tenth son of Sir Henry Fanshaw of Ware Park in Hertfordshire, and was born about 1607. In 1635, he was employed by King Charles I. sent resident to the court of Spain; whence being recalled in 1641, he adhered to the royal interest, and was employed in several important matters of state. At the restoration he was made master of the requests; a station in those times of considerable profit. Afterwards, on account of his skill in the Latin language, he was made secretary for that tongue. In 1661, he was sent envoy to Portugal; and in 1662, with the title of ambassador; when he negotiated the marriage of Charles II. with the infanta Catherina. Upon his return he was made a privy counsellor. In 1664, he was sent ambassador to both Spain and Portugal; at which time the foundation of peace betwixt those crowns and England was laid by him. His conduct during his former employments in those courts gained him such esteem, that his reception was magnificent, exceeding all that were before, which those kings declared was not to be a precedent to succeeding ambassadors. He died at Madrid in 1666, on the very day he had fixed for his return to England. Besides some original poems, he published a translation of Bathista Guarini's "Pastor Fido," and another of the "Lusiad of Camoens." Among his posthumous publications are, "Letters during his embassies in Spain and Portugal, with his life prefixed."

FANTASIA, in the Italian music, signifies fancy; and is used for a composition, wherein the composer ties himself to no particular time, but ranges according as his fancy leads, amidst various movements, different airs, &c. This is otherwise called the capricious style: before sonatas were used, there were many of this kind, some of which still remain.

FANTIN, a fertile country of Africa, on the Gold Coast, extending about 30 miles along the shore of the Atlantic.

FANTIN, the capital of the above territory, lies about 12 miles from the coast.

FANU, a small island of the Mediterranean, 10 miles N. W. of Corfu.

FANUM, among the Romans, a temple or place consecrated to some deity. The deified men and women among the heathens had likewise their fana; even the great philosopher Cicero erected one to his daughter Tullia.

FAOE, a small isle of Denmark, N. of Laland.

FAOUA, or **FOUA**, a town of Egypt, on the W. branch of the Nile, 16 miles S. E. of Rosetta, and 70 miles N. N. E. of Cairo.

FAQUIER, a county of Virginia, 55 miles long, and 20 broad.

FAR BAY, a bay on the N. coast of Sutherlandshire.

FARA, two of the smaller Orkney isles.

PARADEESE, a town of Africa in Tunis, 32 miles S. of Tunis.

FARAND-MAN, a traveller, or merchant stranger, to whom, by the laws of Scotland, justice ought to be done with all expedition, that his business or journey be not hindered.

FARCE was originally a droll, petty show, exhibited by charletans, and their buffoons, in the open street to gather the crowd together. The word is French, and signifies literally, stuffing; from the Latin *farcio*, to stuff. It was applied to this species of entertainment on account of the variety of jests, gibes, tricks, &c.

wherewith it was interlarded. At present, instead of being performed by merry-andrews on the street, it is acted by comedians on the theatre, and becomes the entertainment of the fashionable world!

FARCIN, or **FARCY**, in fariery, a creeping ulcer, a loathsome disease with which horses are sometimes affected. See **FARRIERY**.

FAREHAM, a town of England in Hampshire, on the N. W. of Portsmouth harbour.

FAREMOUTIER, a town of France, in the department of Seine and Marne, 27 miles E. of Paris.

FAREWELL, CAPE, the S. point of W. Greenland on the N. side of the entrance of Davis's Straits. Lon. 42. 42. W. Lat. 59. 37. N.

FARGANI, **ALFRAGAN**, or **ALFERGANI**, a celebrated Arabian astronomer, who flourished about A. D. 800; so named from his birth-place, Fergan, in Samarcand. He is also named Ahmed Ben Cothair, or Katir. He wrote "Elements of Astronomy," in thirty chapters, wherein he chiefly adopts Ptolemy's hypothesis, using his terms, and often quoting him. Of this work there are three Latin translations; the last and best by professor Golius of Leyden, published in 1669, after his death. It is accompanied with the Arabic original, and with many learned notes on the first nine chapters, which Golius's death prevented him from continuing to the end of the work. Encyc. Brit. Sup. vol. i. p. 5.

FARGEAU, ST. a town of France, in the department of Yonne, with a strong fort; 10 miles S. of Briare, and 82 of Paris.

FARIM, a town and territory of Africa, S. of the Gambia. Lon. 13. 50. W. Lat. 12. 10. N.

FARIMA, or **BANSJU**, a province of Japan, noted for its manufactures of silk, cloth, paper, &c.

FARINA, [*Lat.*] flour of corn, &c.

FARINA FÆCUNDANS, among botanists, the impregnating dust on the apices or antheræ of flowers. See **POLLEN**. The manner of gathering the farina of plants for microscopical observations is this: gather the flowers in a dry sunny day at mid-day, when the dew is perfectly off; then gently shake off the farina, or lightly brush it off with a soft hair pencil, upon a piece of white paper; then take a single talc of isinglass between the nippers, and, breathing on it, apply it instantly to the farina, and the moisture of the breath will make that light powder stick to it. If too great a quantity adhere to the talc, blow a little of it off; and, if too little, breathe upon it again, and take up more. Then, put the talc into the hole of a slider, and, applying to it the microscope, see whether the little grains are properly laid; lastly, cover them up with another talc, and fix the ring; but be careful that the tales do not press upon the farina so as to alter its form.

FARLEU, money paid by the tenants in the W. of England, in lieu of a heriot. In Devonshire, farleu is distinguished to be the best goods, as heriot is the best beast, payable at the death of a tenant.

FARM, **FARIN**, or **FERM**, [*Firma*, *Lat.*] in law, signifies a little country messuage or district; containing house and land, with other conveniences; hired, or taken by lease, either in writing, or parole, under a certain yearly rent. See **LEASE**. This in divers parts is differently termed: in Scotland, it is a tack; in Lancashire, a fermeholt; in Essex, a wike, &c. In the corrupted Latin, firma signified a place inclosed or shut in; whence, in some provinces, Menage observes, they call closerie, or closure, what in others they call a farm. We find locare ad firmam signifies to let a farm; probably on account of the sure hold the tenant here has in comparison of tenants at will. Spelman and Skinner, however, derive the word farm from the Saxon *fearme*, or *jeorne*, provision; because the country people and tenants anciently paid their rents in victuals and other necessities, which were afterwards converted into the payment of a sum of money. Whence a farm was originally a place that furnished its landlord with provisions. For the management, culture, &c. of a farm, see **HUSBANDRY**.

FARMER, in mining, is the lord of the fields, or one that farms the lot and cope of the king.

FARMINGTON, a rich town of Connecticut, in Hartford county, 10 miles S. W. of Hartford.

FARN

FARN ISLANDS, two groups of little islands and rocks, seventeen in number, opposite to Bamborough castle in Northumberland.

FARNHAM, or **FERNHAM**, a town of Surrey, and capital of a district of its own name, 41 miles from London on the Winchester road.

FARNOVIANS, in ecclesiastical history, a sect of Unitarians, which arose in the 16th century, so named from Farnovius; whose principles they adopted, and soon after whose death they were dispersed.

FARO, a sea-port of Portugal, in the province of Algarva, on the Gulf of Cadiz, 20 miles S. W. of Tavira.

FARO, a populous and fertile island of Sweden, 30 miles in circumference, separated from Gothland by a narrow channel.

FARO, the capital of the above island, seated on the S. E. coast. Lon. 19. 7. E. Lat. 57. 50. N.

FARO, CAPE, a promontory of Sicily, near Messina, on which is a light-house.

FARO ISLANDS. See **FERRO**.

FARO OF MESSINA, a strait of the Mediterranean, between Sicily and Calabria, about 7 miles across; so named from Cape Faro; remarkable for its tide's ebbing and flowing with great rapidity every six hours.

FARRIERY.

FARRIERY, [from *ferriere*, Fr. a bag of instruments used in the shoeing, &c. of horses, so named from the Latin *ferrum*, iron, of which the instruments were made,] the art of preventing, curing, or alleviating, the disorders of horses. The practice of this useful profession has, till within the last fifteen or twenty years, been almost entirely confined to a class of men, who were utterly ignorant of the anatomy of the horse, and the general principles of the art of healing. Their prescriptions were as absurd as the reasons they assigned for administering their draughts, bolusses, drenches, &c. An institution has at length been established, where the diseases of that noble animal, the horse, are the subject of peculiar attention; we mean the Veterinary College, which, we are happy to state, is patronized by the most respectable of the nobility and gentry. From the manifest great consequence of the services of the domestic animals to man, in a state of civilization, they have, from a very remote period of antiquity, been the objects of his study and attention, both as to their ordinary management, and that which was requisite for them in a state of disease: for the latter a peculiar system was formed, including a materia medica and general mode of treatment considerably distinct from those in use with human patients. Of the authors of this system, whether Greek or Roman, nothing worth notice has been handed down beyond an occasional citation of names, to be found in Columella the Roman writer, who lived in the reign of Tiberius, and treated at large on the general management of cattle; and in Vegetius Renatus, who lived two centuries afterwards, and wrote more professedly on animal diseases. Both these authors have treated their subject in elegant and classical Latin; and the latter most particularly has urged, in very eloquent and forcible language, the necessity of a liberal cultivation of the veterinary art, as well on the score of profit as of humanity. It ought to be remembered, however, that neither of these authors had the benefit of any professional acquaintance with medicine or surgery, so obscure and imperfect were those sciences in their days; and that no ancient treatise on the diseases of animals, written by a professional man, has descended to posterity. Nor is this in the smallest degree to be regretted, since we not only find in the authors above-mentioned a sufficient field for the satisfaction of our curiosity, but also the most ample proofs of the irrationality of ancient principles and practice, and their total inapplicability to modern occasions. On veterinary anatomy and physiology no attempts at discovery or improvement are to be traced in those writers, a singular defect, considering the progress which had been made in Egypt and Greece in both the human and comparative anatomy. Celsus is the only physician of eminence among the ancients who is reported to have written on veterinary medicine; this part of his works has not survived, nor is probably the loss we have thereby suffered very considerable. Xenophon is the oldest veterinary writer on record; but his treatise is confined to the training and management of the horse for war and the chase. With respect to the fragments of ancient Greek and Latin veterinary writers, collected and published by Ruellius, chief marshal, or farrier to Francis I. king of France, they appear to have been generally the works of military men, or other lovers of the horse; perhaps none of them were of medical education. We learn from

the works of one of them, (Theomnestus,) which is confirmed also by others, that the ancients had a knowledge of the disease called the glanders in horses and other cattle, which was denominated in those days the moist malady. The chief merit of the ancient veterinary writers consists in their dietetic rules and domestic management; they were in the habit of purging their animals, but in other respects their medical prescriptions appear to us an inconsistent and often discordant jumble of numerous articles, devoid either of rational aim, or probable efficacy. In the operations of surgery, particularly in phlebotomy, and indeed in the various methods of manual treatment and controul of their animals, the ancients were far more skilful; and what they have left on the symptoms of diseases, if of no consequence in the present advanced state of science, still serves to demonstrate that they had not been inattentive observers of animal diseases, however inferior they might be in their methods of cure. These ancient writers are yet to be esteemed superior, not only in learning and eloquence, but in professional utility, to the majority of their pupils of the fifteenth, sixteenth, and seventeenth centuries. On the revival of learning in Europe, at the above periods, the works of the ancient veterinary writers were early sought and translated in Italy and France. At the same dawn of opening light and enthusiasm for the resuscitation and enlargement of the bounds of useful science, the anatomy and physiology of the human body became the grand objects of pursuits in the Italian schools. Veterinary anatomy followed in course; and the destructive labours of Ruini and others on the body of the horse, have not only served for a ground-work and model to all the schools of Europe since; but succeeding discoveries and improvements, notwithstanding the vast advantage of a general diffusion of light have not been hitherto sufficiently considerable to detract in any eminent degree from the well-earned fame of those early and original anatomists. Veterinary medicine was now generally cultivated, and in some instances, under regular medical professors. We find the following names in a list of those who had written on the res veterinaria in Italy during that period:—Laurentius Russius, Camerarius, Apollonius, Horatio, Albeterio, Grill, Casar Fiaschi, Evangelista; and afterwards in Germany and France, Gresson, Libal, Wickerus, La Brove, Vinet. Every branch of the Equine œconomy, whether relative to harness and trappings, equitation and military menage, or riding the great horse, the methodical treatment of the hoof, with the invention of various forms of iron shoes, and their scientific adaptation, were pursued with general assiduity and success. In this latter department Casar Fiaschi distinguished himself; and either invented or recommended the welshed shoe, proposing a substitute for calkens and frost-nails, which it appears were then in use, as well as the lunette, or short half-moon shoe. Evangelista, of Milan, distinguished himself in the breaking or education of the horse, and to him is attributed the invention of the martingale. The new veterinary science having diffused itself over a great part of the continent, could scarcely fail of occasional communication with this country, where the care of the diseased animals had been committed immemorially to leeches and farriers, persons generally belonging to the most illiterate class of society. It is probable that such communi-

cations became frequent during the reign of the first Tudors; for we learn from Blundeville, who wrote in the time of Elizabeth, that French and German farriers and riding-masters were not only employed by the queen, but in general by the nobility and gentry of the country. Yet our improvements in this country, in consequence of foreign aid, with regard to the medical and surgical branches at least, were by no means great, extending our view from the period of which we now speak, to the early part of the eighteenth century. No medical name appears during that long interval upon our veterinary list, nor any one of the smallest scientific pretension, we mean as far as respects the medical, anatomical, or surgical branches, that of Snape excepted, who was farrier to Charles II. and whose family, it appears by his book, had served the crown in that capacity upwards of two hundred years. Snape's anatomy of the horse proves him to have been a well-informed farrier. His anatomical system, arrangements, and nomenclature, were in course drawn from the Italian school; but he dissected, and his descriptions were confirmed by his own observation. His numerous plates are bold, accurate, and handsomely executed. Whether or not he published the book of cures which he promised, we are uninformed, but he was doubtless far better qualified for that task than those of his profession upon whom that branch of veterinary art unfortunately devolved. Stevens, Martin, Clifford, and Morgan, were very early writers among the leeches and farriers. The book of Maschal, farrier to James I. is most laughably illiterate, and we cannot help wondering with a late author, how such a book could possibly pass through numerous editions in a learned age, and which even possessed learned and rational books on the same subject. The above list may be concluded with De Grey and the celebrated Gervase Markham, a contemporary of Blundeville, who continued to publish perhaps until after the Restoration, and whose works were stuffed with every absurd, barbarous, and abominable juggling trick, as well as with every useful invention which had issued from the brains of either ancients or moderns. As a specimen of the medical part of the horse-leech craft of Markham, he prescribes human ordure in certain cases for the horse, both externally and internally. Yet this man's works had a most rapid and universal sale, and continued in repute until the days of Gibson, and even long afterwards among the country leeches and farriers. It must be allowed that Markham's book contained the fullest detail of the practice of the farrier, with a delineation of his instruments, not materially different from those in present use. Blundeville wrote sensibly and respectably on the general subject of the horse, according to the continental, the then fashionable practice. Baretti, in the succeeding reign, that of James I. wrote a learned treatise, entitled an *Hipponomie*, or the *Vineyard of Horsemanship*, in which he ably, and from obvious great experience, discusses all the relative branches, including the principle and practice of the race-course, and of that system of equitation peculiar to, and so generally prevalent in, this country. The huge folio of the duke of Newcastle gives us the regular manege of the horse from the continental schools, with an account of the different races of the animal, in which his grace was a connoisseur of high celebrity. In the early part of the eighteenth century William Gibson turned his attention to horse medicine and surgery. He had acted in queen Anne's wars as army-surgeon, and appears by his writings to have been a man of much practical knowledge and sound judgement. He was the first regular professional man who attempted to improve veterinary science, which he effected in a plain and popular way, grounded on the analogy between human and brute physiology, in course between human and animal medicine. The appearance of Gibson's book on farriery forms an era in veterinary annals; and his system in fundamentals has ever been, and is at this moment, the basis of our superior veterinary practice. He lived to publish a new edition of his chief work, about the middle of the eighteenth century. Dr. Bracken, a physician of Lancaster, a vulgar, desultory, captious, and petulant writer, yet a profound and enlightened reasoner, and of great ability in his profession, in a few years followed the laudable example of Gibson, and turned his attention to veterinary medicine. He was an exquisite practical judge of the animal of which he treated; and his work on farriery is a standard with respect to the jockey or peculiar English system, a branch which had been left untouched by Gibson. Bartlet, a surgeon in Bow-street, Covent-garden, was a most respectable, intelligent, and useful compiler

from Gibson and Bracken, whose labours he circumscribed and improved. William Osmer, a surgeon, turned his attention to veterinary and surgery, and published an excellent and practical, although whimsically written, book on horse-shoeing. His book has not probably been hitherto excelled in point of utility; and being written in a plain and popular way, is adapted to the capacity of the shoeing-smiths. The earl of Pembroke also wrote a short and excellent treatise on the same subject, practical horse-shoeing and case of the feet, and on the education of the military horse. Berenger about the same time, published a respectable work on the grand manege. Mr. Clarke, the king's farrier for Scotland, has published two valuable treatises on shoeing, and on prevention of the diseases of horses. The eighteenth century was abundantly fruitful in veterinary pursuits and publications. France took the lead; but a zeal for this science also pervaded Germany and the northern states, and colleges were established in various countries, where in the science has been since regularly cultivated. Baron Haller collated the various continental writers on black cattle and sheep; another catalogue of them may also be found in the *Giornale di Letterati di Italy*. Since these collections, the number of veterinary writers has been immense on the continent. Few or none of them have been translated into our language, excepting detached parts of the works of the eminent French writers, La Fosse and Bourgelat. The French have improved the anatomical and surgical branches of the veterinary art, rather than the medical; the English have made the greatest improvements in the latter: it is not improbably a parallel case with respect to human medicine. In 1792 the veterinary college was instituted at St. Pancras, near London. Towards the support of this institution, a sum is allowed annually by Parliament; it also derives some aid from the fees of students, and from subscription. The donation of twenty guineas makes a subscriber for life, and the payment of two guineas yearly gives the same title for that term. In either case the privilege of sending two horses to the veterinary hospital, free of all charges, except for keep, is thus acquired. His majesty has given considerable importance to the institution, by requiring that all veterinary surgeons, employed in the army, should have passed examination at the college, and he has eminently served the whole of the cavalry corps by conferring on those surgeons the rank of commissioned officers. And a great number of veterinary surgeons, receiving their diploma from thence, have been dispersed in the army and throughout the country, to our great national advantage, in the surgical and medical treatment of horses. A number of farriers also annually take the advantage of improving themselves at this seminary; but it is to be lamented that the light of veterinary science has hitherto shined but dimly and imperfectly on the other domestic animals. Mr. Coleman, the present professor, is well qualified for the important office he holds, and his exertions have been of very great advantage to the public, and of no less credit to himself. A great number of veterinary publications have issued from the press within this last period; and the two professors St. Bel and Coleman, with Messrs. White, Boardman, Blane, and many others, have laudably and usefully distinguished themselves in this way. Mr. Blane appears to have taken great pains in a new branch of veterinary science, as it relates to that useful domestic the dog. He has also published the anatomy of the horse. But the anatomical drawings and engravings of the bones, muscles, and many of the blood-vessels of the horse, of our justly celebrated horse-painter Stubbs, are held superior to any thing we possess of this kind. The objects of farriery we have shewn, are the anatomy, physiology, pathology, medical and surgical care, and shoeing, of the horse. Snape says, that "in some regards anatomy is more necessary to farriers than to physicians, in order to find out disorders; for besides the pulse and the urine, and the pathognomonic signs of each distemper, they (the latter) are assisted in their enquiries, moreover not to say chiefly, by the complaints and relations of the patients themselves; whereas a farrier, having to do with a dumb creature, must be very curious in his knowledge of the parts, with their offices, and of the sympathy or consent that one part hath with another; or else, seeing all his information must be of his own hammering out, he is like to make but a short discovery of the distemper."

OF THE ANATOMY OF THE HORSE.

The anatomy of the horse, in many respects, bears so close an analogy to that of the human subject, that the general description of

of the one will apply pretty accurately to the other. Thus, the horse is an animal composed like the human subject, of solids and fluids; of bones, cartilages, ligaments, fibres, membranes, arteries, veins, nerves, absorbents, muscles, glands, &c. It is therefore unnecessary here to repeat the definitions and descriptions of these parts already inserted under anatomy, which, with little variation, will apply to those of the horse; and for this reason, we refer the reader to ANATOMY, ZOOLOGY, and the above-mentioned works, and shall on this part of the subject only consider the external denominations, the skeleton, the contents of the chest and belly, with the principal parts of the feet.

OF THE EXTERNAL PARTS OF A HORSE.

"The first thing," says Mr. Reeves, "that offers itself to our view, is the coat, or hair. This has different denominations in several parts of the body. The fore-top is called the topping, or tuke: the hairs on the under lip are the beard: those along the upper part of the neck are called the mane: the part that is most arched, the crest; and when that sinks, a horse is said to be crest-fallen: the tuft of hair on the lower part of the leg behind, above the heel, is termed the fetlock, or feet lock: the hair, that grows round over the top of the hoof, is named the crown, crownet, or crowt: the hair on the eye-lids is the brills. The usual term for the body of a horse, is the carcass. The fore-head is often called the brow. The two hollows above the eyes, which are most remarkable in old horses, are termed the eye-pits. The mark, which often runs down the face, is the rache: and the white spot on the forehead, the star. The back part of the head, where it joins the neck is the poll: and the juncture of the head and neck, the onset, or setting on, of the head. The lips with the tip of the nose form the muzzle. The place on the inside of the mouth, where the tongue lies is the charnet. The fleshy rows that run across the upper part of the mouth, and are very remarkable in young horses, are called the bars. The top of the shoulder blades, and the highest part of the spine at the setting on of the neck are the withers; and from the top of these a horse is measured to know his size. From the withers to the hind part of the back are the reins. Next the reins are the loins, though some call the whole extent, from the withers to the croup, the reins. The extremity of the reins, above the hips, is called the croup. The part where the crupper lies is the channel; and the tail is the dock, or runt. The sinking of the back, if any, is named the sway. The hinder part of the belly, next the genitals, is called the flank, which reaches from the small ribs to the haunches. The loose skin which covers the yard is the sheath. The belly reaches from the brisket to the sheath. The point from the withers to the top of the thigh, inclosing the whole breast on both sides, is called the shoulder. The fore-legs, or arms, begin from the shoulder; and the hind part, pointing towards the brisket, is the elbow. The middle joint is the knee, to which the fore-leg reaches. The extent from the knee to the pastern is called the shank; and the strong tendon behind the shank, which is inserted into the heel, is termed the back sinew. The place where the shank joins the pastern, is distinguished by the pastern, or fetlock joint. The pastern reaches from the lower part of this joint to the foot, has a joint in the middle, to facilitate the motion of the foot, which distinguishes it into two parts; the greater pastern, next the shank, and the less, next the foot. The joining of this last with the foot is called the coffin-joint. The hoof is by some called the horn, but most commonly the coffin, because it incloses the bone of the foot. The tender part of the hoof, next the heel, is named the frush; and the ball of the foot the frog: though some give the same denomination to both, and thus the frush or frog rises from the middle of the foot, and reaches to the heel. The sole is the horny part, which covers the rest of the bottom of the foot, and adheres to the verge of the hoof, where nails are driven when a horse is shod. The sides meeting on the heel are the quarters. The haunches begin at the two bones of the back part of a horse, which inclose the ham, hock, or hough. The stifle is the kneepan of a horse seated in the middle joint of the thigh; and is outwardly that part, which sets out from the thigh towards the belly. The thigh or gascoin, begins at the stifle and reaches to the bending of the ham. The ham, or hock, is the bending of the hind-leg; and the round knob behind is called the heel of the hock, in which the great master sinew is inserted. The small of the hind-

leg is named the instep. The pasterns and feet are distinguished as in the fore-legs. That side of a horse, which we approach to mount him, is called the near side, and the other the off side. Hence come the terms near foot and off foot, the near eye and the off eye, and so of the rest."

OF THE SKELETON.

The skeleton of the horse may be divided into the head, trunk, and extremities. In Plate LXVIII. fig. 1. the letters *aaaa*, shew the os frontis, or forehead bone: *bb*, the parietal, or vertical bone: *ccc*, the occipital, by some called the knoll bone: *dd*, the temporal bone, made up of two parts, the squamous and petrous: *ee*, maxilla superior, or anterior: *f*, jugal, or cheek bone; *gg*, nasal, or bones of the nose: *h*, os unguis: *iii*, posterior jaw, or maxilla inferior: these are all the bones forming the head that appear on a side view. The following figures refer to particular parts of the bones, viz. 1. The petrous portion of the temporal bone, a hollow process, which forms. 2. The meatus auditorius, or opening to the ear. 3. The maxillary process of the temporal bone. 4. The cuneiform process of the occipital. 5. The zygomatic process of the temporal, joined to the jugal process, and forming the zygoma, or arch of this part. 6. The occipital protuberance. 7. The orbit, or cavity of the eye. 8. The coronoid process of the posterior or lower jaw. 9. The condyloid process that articulates the posterior jaw with the head. 10. A hole, called the superciliary foramen, through which the frontal nerve and artery pass. 11. A process of the frontal bone joining with the zygomatic process of the temporal. 12. A hole transmitting a nerve and artery to the face. 13. A third foramen, from which proceeds a branch of the 5th pair of nerves, and an artery. 14. The grinders. 15. The tushes. 16. The nippers.

The CERVICAL VERTEBRÆ, or NECK BONES. *AAAAAAA*, the 7 cervical vertebræ, the first of which, *b*, is called the atlas; the 2d dentate; *c* marks the transverse process of the first; as *ddddd*, do the same processes of the other six: *eee*, &c. the superior or antique oblique processes of the six last; in the first it is wanting: *fff*, &c. their inferior or posterior oblique processes; *ggg*, &c. the spinous processes of the same.

The remainder of the bones of the SPINE, *aaaaaa*, &c. the 18 dorsal vertebræ; *b*, their spinous processes; *c*, their transverse processes; *d*, their upper or anterior oblique processes; *e*, their lower or posterior oblique processes; *f*, the cartilage interposed between each dorsal and lumbar vertebræ; one only is marked, but will serve as a guide for the rest. *BCDE*, *FG*, the lumbar vertebræ, or those of the loins. The same description answers to these as to the dorsal, the great length of their transverse processes only being noticed. The numerals I, II, III, IV, V, mark the five pieces, of which the os sacrum is composed in the young subject, but which by age become entire bone. The figures, from 1 to 18, denote the 18 bones of the tail.

BONES OF THE THORAX, AND SHOULDER BLADES. *AA*, the sternum: 1, 2, 3, 4, 5, 6, 7, 8, the eight true ribs, so called as their cartilages are immediately attached to the sternum; 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, the false ribs, so called from their cartilages not being inserted into the sternum, but into each other; *a*, the head that articulates with the transverse process of the first vertebra of the back; *b*, the anterior part of the head that is connected to the body of the seventh vertebra of the neck; the same description answers for each of the other ribs. *A. A.* The scapula or shoulder blade; *a*, the superior, or more properly anterior spinatus fossa; *b*, the inferior spinatus fossa; *c*, the spine which divides these two fossa, and from which they take their name; *d*, the upper costa; *e*, the lower costa; *f*, the neck; *g*, coracoid apophysis: at the upper part is seen a line, shewing the extent of the cartilage of the scapula.

BONES OF THE FORE-LEGS. *B*. The humerus, or bone of the arm; *i*, its head that articulates with the shoulder blade; *k*, its external condyle; *l*, the fossa, or cavity receiving the radius; *m*, that which receives the cubitus. *c*, the cubitus or ulna: this in the young subject is a distinct bone, but in the grown horse is fastened to the radius; *n*, the process called olecranon, forming the elbow. *D*. the radius; *o*, its upper end; *p*, its lower extremity, forming a part of the knee. *E*. the carpus, which in the horse is formed of 7 bones; the tarpesium, which in the human subject forms the 8th, is wanting in the horse; this part forming the wrist.

of a man, is by long custom called the knee of the animal. F. the metacarpus or shank bones, to each of which are joined two imperfect metacarpal bones marked g, called by the French epineux; r, r, the sesamoid bones. G. the pastern bones. H. the coracæ, or little pastern bones. I. the coffin bone. There is another sesamoid or small bone within the curve of the coffin bone; which will be described afterwards.

THE PELVIS AND BONES OF THE HINDER EXTREMITIES. K. the pelvis, composed of three bones in the young subject, which are *aaaaa*, the ilium; *bb*, the ischium; *cc*, the pubis; *d*, foramen magnum. L. the femur: *e*, its head, articulating with the acetabulum, or cavity in the pelvis; *ff*, the great trochanter: *g*, the linea aspera; *kk*, the patella, or stifle, but more properly the knee bone. M. the tibia. N. the fibula; this, as in the cubitus or ulna, is firmly attached to the tibia, and is an inconsiderable bone, compared with that of the human subject. O. the tarsus, consisting of six bones, the great cuneiform bone being wanting which in the human body forms the 7th; *ll*, the calcaneum. PP, *pp*, the metatarsus, which follows the same description as the anterior extremities.

OF THE CONTENTS OF THE THORAX.

The chest being opened by raising the sternum, there appears a smooth polished membrane, the pleura, attached to its upper surface. This membrane is there double, but unites about an inch above the sternum; and the space between the double reflection is filled by cellular substance posteriorly, and by the thymus gland anteriorly. See ANATOMY, and Plate LXVIII, fig. 2. This space is called the inferior mediastinum: the two laminae then separating pass over the pericardium, and over the vessels, to be reflected on the lungs. After having passed over the lungs; one portion goes over the spine on one side, the other portion over the spine on the other side; leaving in this division a tubular opening, filled by the aorta, vena cava, azygos, thoracic duct, and œsophagus. This forms the superior mediastinum. There are therefore two reflections of the pleura on each side; one close under the ribs, the other in contact with the lungs. A bag is formed by this reflection; but the lung is not contained within it, as it is usually described, but a small quantity of water, the liquor pleurae. If this bag be cut into, the lung on that side is rendered for a time useless, by the air being admitted and preventing its expansion; but the distinct separation, formed by the reflections of the pleura, preserves the functions and powers of the other lung entire; without which wise provision, accidents and diseases of these parts would be more injurious, and more frequently fatal.

The PLEURA has few arteries and veins; and but little sensibility, if any, when uninfamed; but under inflammation, as is seen in pleurisy, peripneumony, &c. it has a great degree of it. The mediastinum is simply the junction of the two laminae of the pleura, dividing by distinct partitions the cavity of the chest. At the anterior and inferior division of the pleura, is situated the thymus gland. See ANATOMY.

The LUNGS, when inflated, are said to resemble the figure of the cloven foot of the ox. They are spongy in their texture, being every where full of little cavities, which are the minute ramification, or distribution of vessels termed bronchial, arising from one common trunk called the trachea. By means of these vessels, air is received throughout the substance of the lungs; depositing its vital part, it is returned from thence, and fresh air admitted.

Between the lungs is placed the HEART, supported in its situation by various attachments. It is covered by a membrane called pericardium, and is of an elliptical form: its anterior and superior part is called its basis; its posterior and inferior part its apex. The basis is confined by vessels; the apex is loose, and strikes against the intercostal muscles, giving the pulse from the heart. See ANATOMY. Fig. 2, of Plate LXVIII, represents such of the abdominal viscera, as appear immediately on the integuments being removed; and such of the thoracic viscera, or contents of the chest, as become evident on raising the sternum. *aaaaa*, the skin. *bbbb*, the integuments thrown back, consisting of muscles, tendons, and peritoneum. *cccc*, the most extensive of the large intestines, called the colon. *ddd*, the ligamentous bands of the colon, drawing it into folds. *e*, one of the small intestines. *ff*, the diaphragm, a large muscle, dividing the chest from the abdomen. *ggg*, the lungs. *h*, the heart. *iii*, the pericardium, a

bag surrounding the heart, containing a quantity of fluid; it is here opened to shew the heart, *kk*, the ribs. *l*, the sternum. *m*, the ensiform cartilage.

OF THE CONTENTS OF THE ABDOMEN.

The abdomen is divided into 4 regions. The epigastric, umbilical, and hypogastric inferiorly; and the lumbar superiorly. The epigastric region begins at the ensiform cartilage, or end of the breast-bone, and extends to within about six-inches of the umbilicus or navel: within its limits are situated the liver, the stomach, the pancreas, parts of the colon, of the spleen, of the duodenum, of the aorta, and vena cava. The umbilical region begins where the epigastric ends, at about six inches before the navel, to the same distance behind it; so that its extent is about 12 inches. It contains great part of the small intestines, the cœcum, parts of the colon, of the aorta, and vena cava, with a portion of the mesentery, and omentum. From the extent of the umbilical region, that is six inches behind the navel, to the bottom of the pelvis, and whole posterior part of the belly, is the hypogastric region; containing the rectum, bladder, part of the colon, the iliac vessels, and parts of generation. The lumbar region is that which is situated as it were upon these; and is formed from the hollows left on each side of the spine, from the beginning of the abdomen nearly to the end. It includes the kidneys and their appendages, the emulgent vessels, parts of the ureters, and greater part of the spleen. The whole of the abdominal cavity is lined by a membrane called peritoneum; it not only lines the cavity, but invests the whole of its contents, by being reflected over them. It has few vessels or nerves; when wounded therefore it bleeds little, and has not much pain, except under inflammation, when it becomes very sensible. It secretes a fluid of a serous nature, for the lubrication of the viscera, and for the prevention of adhesions; this may become so much increased in quantity as to cause dropsy. By its attachments it preserves the parts it invests in their proper and true situation; which seems to be its principal use. Fig. 3. Plate LXVIII, represents the two cavities of the chest and belly; with such of their contents as are immediately seen, when the parts represented in the former figure (the heart, lungs, and intestines,) are removed. A, the stomach nearly in its natural situation; upon its surface are seen its vessels. BB, the lobes of the liver. C, the omentum or caul, attached to the stomach throughout its whole length, covering the pancreas entirely, and in part the spleen. At one part it is held back by a pin, forced into the substance of the spleen, to shew the renal gland. D, the spleen. E E, the kidneys. F, part of the rectum. GG, the ovaria. H, the uterus or womb. I, the bladder distended with urine. KK, the diaphragm, or midriff. *aaa*, the aorta descendens, seen in both cavities. *b*, vena cava descendens; it is not seen plainly in this view in the chest, therefore is not distinguished. *cc*, the emulgent veins, emptying their blood into the vena cava. *dd*, the emulgent arteries, arising from the aorta. *ee*, the spermatic arteries and veins, united by a cellular substance soon after their origin, distributed to the ovaria. *ff*, the ureters, arising from the kidneys, and inserted into the sides of the bladder rather superiorly. *gg*, the iliac vessels, being the bifurcations of the aorta and vena cava. *hh*, the cavity of the pelvis. *i*, part of the duodenum, or first intestine, with which the expellent orifice of the stomach is united. *k*, the gall duct, seen arising from the liver, and inserting itself obliquely into the duodenum. *l*, ligamentum suspensorium, one of the ligaments attaching the liver to the diaphragm. *mm*, capsula renales, or renal glands, receiving vessels from the emulgent artery and vein. *nn*, the œsophagus, or canal for the passage of the food into the stomach. *o*, the ascending aorta. *p*, the ascending vena cava. *q*, the division of these vessels into branches, the principal of which are, *rr*, the subcostal arteries cut off furnishing with blood the fore-legs. *ss*, subcostal veins cut off, returning the blood from the fore-legs. *tttt*, jugular veins, returning the blood from the head. *uuuu*, carotid arteries, carrying blood to the head. *v*, a pipe, supporting these last vessels to render them more distinct. *ww*, the trachea or windpipe; the portion entering into the chest is removed. *x*, the œsophagus or gullet, brought from its situation behind the trachea, and supported with a knife. *yyyy*, the integuments of the abdomen thrown back. The principal parts of the foot are shewn in Plate LXVIII, fig. 4, 5, 6, 7. Fig. 4, shews the horny sole *d*, raised

raised from the fleshy sole *eee*, round which is the enchanneled flesh *f*, placed in the fulcus of the inner surface of the hoof *g*, the horny part of which is soft and white. Fig. 5, shews the under part of the fleshy sole *h*, raised from the foot bone, called the coffin bone *iii*; *k*, the covering of the tendo achillis; *n*, the cartilage; *m*, the edge of the fleshy sole confined in the furrow of the channeled horny substance. Fig 6 and 7, represent the bottom or base of the foot: *aaa*, the horny sole; *b*, the frog; *c*, the roof towards its lower edge, called the crust, or wall, of the foot.

OF THE TEETH AND AGE OF THE HORSE.

The horse has forty teeth: twenty-four double teeth, or grinders; four tushes, or single teeth; and twelve front teeth, or gatherrers. Mares in general have no tushes. The black marks, or cavities, which denote the age, are to be found in the corner front teeth, adjoining the tushes. Horned cattle have similar marks in the teeth. At four years and a half old, the mark-teeth are just visible above the gum, and the cavity is very conspicuous. At five, the horse sheds his remaining colt's teeth, and his tushes appear. At six, his tushes are up, and appear white, small, and sharp; near which is observable a small circle of young, growing, flesh: the horse's mouth is then complete, and the corner teeth filled up. At seven years old, the two middle teeth fill up. At eight, the black marks vanish, and the horse's mouth is said to be full, and himself aged. The French farriers aver that the marks remain in the teeth of the upper jaw until the horse is twelve years of age; but we believe this to be fortuitous.

OF THE MANAGEMENT OF HORSES, WITH REGARD TO FOOD AND MEDICINE.

GENERAL DIRECTIONS RELATIVE TO FOOD, DIET, EXERCISE, &c.

1. It ought to be laid down as a general rule, to give horses as few medicines as possible; and by no means to comply with the ridiculous practice of those who frequently bleed, purge, and give balls, though their horses be in perfect health, and have no indication that requires such treatment. 2. Proper management in their feeding, exercise, and dressing, will alone cure many disorders, and prevent most; for the simplicity of a horse's diet, which chiefly consists of grain and herbage, when good in kind, and dispensed with judgement, secures him from those complicated disorders, which are the general effects of intemperance in the human body. 3. In France, Germany, and Denmark, horses are seldom purged; there they depend much on alteratives; the use of the liver of antimony we have from the French, which is in general a good medicine for that purpose, and may, in many cases, be substituted for purging. 4. As hay is a material article in a horse's diet, great care should be taken to procure the best: when it is not extraordinary, the dust should be well shaken out before it is put in the rack; for such hay is apt to breed vermin. 5. Beans afford the strongest nourishment of all grain; but are fittest for laborious horses, except on particular occasions. In some seasons they breed a kind of vermin called the red bugs, which is thought to be dangerous; the best method in such cases is to procure them well dried and split. 6. Bran scalded is a kind of panada to a sick horse; but a too frequent use of it, either dry or scalded, is hurtful, as it relaxes and weakens the bowels. The botts in young horses may be owing to too much musty bran and chaff, given with other foul food to make them up for sale; particular care should therefore be taken that the bran be always sweet and new. 7. Oats, well ripened, make a more hearty and durable diet than barley, and are much better suited to the constitutions of British horses. A proper quantity of cut straw and hay mixed with them, is sometimes very useful to horses troubled with botts, indigestion, &c. 8. Horses, that eat their litter, should particularly have cut straw and powdered chalk given them with their feed; as it is a sign of a depraved stomach. 9. The salt marshes are good pasture for horses who have been surfeited, as well as for those under many other disorders: they purge more by dung and urine than any other pasture, and make afterwards a finer flesh; their water is for the most part brackish, and of course, as well as the grass, saturated with salts from the sea-water. 10. A summer's grass is often necessary; more particularly to horses glutted with food, and which use little exercise: but running for a month or two is proper for most; those especially who have been worked hard, and have stiff

limbs, swelled legs, or wind galls. Horses whose feet have been impaired by quitters, bad shoeing, or many other accidents, are also best repaired at grass. Those lamenesses particularly require turning out to grass, where the muscles or tendons are contracted or shrunk; for by the continual gentle exercise in the field, with the assistance of a patten shoe on the opposite foot, the shortened limb is kept on the stretch, the wasted parts are restored to their ordinary dimensions, and the limb again recovers its usual tone and strength. 11. The fields which lie near great towns, and are much dunged, are not proper pasture for horses; but are found to be very injurious to them, when fed thereon all the summer. 12. Horses may be kept abroad all the year, where they have a proper stable or shed to shelter them from the weather, and hay at all times. Thus treated, they are seldom sick; their limbs are always clean and dry; and, with the allowance of corn, they will hunt, and do more business than horses kept constantly within doors. 13. If horses, when taken from grass, should grow hot and costive, mix bran and chopt hay with their corn; and give them sometimes a feed of scalded bran for a fortnight, or longer: let their exercise and diet be moderate for some time, and increase both by degrees. 14. When horses are soiled in the stable, care should be taken that the herbage be young, tender, and full of sap; whether it be green barley, tares, clover, or any thing else the season produces; and that it be cut fresh once every day at least, if not oftener. 15. When horses lose their flesh much in soiling, they should in time be taken to a more solid diet: for it is not in soiling as in grazing; where, though a horse loses his flesh at first, yet after the grass has purged him, he soon grows fat. 16. Young horses, not fully grown, should be indulged more in their feeding than those come to their maturity; but if their exercise is so little as to make it necessary to abridge their allowance of hay, a little fresh straw should constantly be put in their racks to prevent their nibbling the manger, and turning crib-biters; they should also be sometimes strapped back in order to cure them of this habit. 17. It is obvious that great care should be taken of a horse after violent exercise; that he cool not too fast, and drink no cold water. 18. Most horses fed for sale have the interstices of their muscles so filled with fat, that their true shapes are hardly known. For which reason a horse just come out of the dealer's hands should at first be gently used. He ought to lose blood, and have his diet lowered, though not too much: walking exercise is most proper at first, two hours in the day; in a week or fortnight two hours at a time, twice a-day; after this usage for a month, bleed him again, and give him two or three times a-week scalded bran, which will prepare him for purging physic, that may now be given safely, and repeated at the usual intervals. 19. When a horse comes out of a dealer's hands, his cloathing must be abated by degrees, and care taken to put him in a moderately warm stable; otherwise the sudden transition would be attended with the worst consequences.

OF BLOOD-LETTING.

Horses, that stand much in the stable, and are full fed, require bleeding now and then: especially when their eyes look heavy, dull, red, and inflamed; as also, when they feel hotter than usual, and mangle their hay. Young horses should be bled when they are shedding their teeth, as it takes off those feverish heats they are then subject to. But the cases that chiefly require bleeding, are colds, fevers of most kinds, falls, bruises, hurts of the eyes, strains, and all inflammatory disorders, &c. A horse should be bled when he begins to grow fleshy at grass; and it is generally proper to bleed before purging. Horses should always be bled by measure, that the quantity taken away may be known exactly: two or three quarts are always enough at one time. The disorder and the horse's constitution should be considered before repeating it. The fleam and blood-stick have been long in use for bleeding horses, but many practitioners prefer the spring fleam as being much safer, others use the lancet. The frequent accidents consequent on striking with the blood-stick, and perhaps dividing the vein, and causing a dangerous tumour in the neck, are notorious. But in opposition to the use of the lancet, it is said to require more skill; and that the horse, on first feeling the point, unless the desired effect be instantaneous, shifts the position of his neck, and prevents success in the operation. Thus adroitness in the use of the lancet and instant execution, seem the only desiderata, by which to obtain a most beneficial improvement in practice. By some this advantage

is obtained, and they prefer the common lancet used in human phlebotomy. The horse, from past experience of perhaps repeated strokes, is ever shy of the farrier and the blood-stick. Surely even the prick of the lancet must occasion less alarm; and were the horse moderately twitched, or even his head made fast, he might be held sufficiently steady. Mr. Clark (see his book,) shews the danger in making the ligature round the horse's neck, previously to sticking and cutting the orifice; but in the use of the lancet, this is not so material, and the ligature may be slackened, upon the completion of the orifice. Should it be necessary to pin the wound as usual, care should be taken not to raise the skin from the vein, whence the blood may flow into the cellular substance between the vein and the skin, and form a lump or tumour, commonly called a swelled neck. Animals should never be bled at random, as is too often the case at this day, but by measure; nor is the practice lately introduced of drawing such large quantities, amounting to upwards of a gallon of blood, from a horse at one time, either rational or ultimately beneficial, in any case.—The most proper place for making the opening in the jugular veins, is where the teguments are thinnest, which is about a hand-breadth from the head, and about one inch below the branching, or joining of the vein which comes from the lower jaw, and which may be distinctly seen when any pressure is made on the main branch of the vein. In general, blood-letting should be reserved for inflammatory and critical cases, and nothing can be more absurd than the custom of regular periodical bleeding, whether in man or horse; neither bleeding nor diuretics can be the sufficient substitute for purgatives, when the plain intent is to remove obstruction and inflammation by unlading the bowels.

OF PURGING.

In gross full horses purging is often necessary, in some disorders of the stomach, liver, &c. but should be directed with caution. Before a purge is given to any horse, it is necessary some preparation should be made for it, to render the operation more safe and efficacious: thus a horse that is full of flesh should first be bled, and at the same time have his diet lowered for a week, especially those that have been pampered for sale; several mashes of scalded bran should also previously be given, to open the bowels, and unload them of any indurated excrements, which sometimes prove an obstacle to the working of the physic, by creating great sickness and griping. It should be remembered, that a horse is purged with difficulty; that the physic generally lies 24 hours in the guts before it works; and that the track of bowels it has to pass through is above 30 yards, all lying horizontally: consequently resinous and other improper drugs may, and often do, by their violent irritation, occasion extensive gripings and cold sweats, shave off the very mucus or lining of the guts, and bring on inflammations, which often terminate in mortification and death. The stomach and guts of a horse are but thin, compared to those of some other animals of the same bulk, and therefore must be more liable to inflammation and irritation. The first purge given to a horse should be mild, to know his constitution. It is a mistaken notion, that if a proper prepared purge does not work to expectation, the horse will be injured by it; for though it does not pass by stool, its operation may be more efficacious as an alternative to purify the blood, and it may pass by urine or other secretions. Purgative medicines are very successfully given in small quantities, mixed with others; and act then as alteratives. If mercurial physic be given, care should be taken that it be well prepared; and warmer clothing and greater circumspection are then required. A purge should be given early in the morning upon an empty stomach: about three or four hours after the horse has taken it, he should have a feed of scalded bran; and a lock or two of hay may then be put into his rack. The same day give him two more mashes; but should he refuse warm meat, he may be allowed raw bran. All his water should be milk-warm, and have a handful of bran squeezed in it; but if he refuse to drink white water, give it him without bran. Early the next morning give him another mash; but if he refuse to eat it, give him as much warm water as he will drink: let him be properly clothed, and rode gently about. This should be done two or three times a-day, unless he purge violently; once or twice will then be sufficient: at night give him a feed of oats mixed with bran. During the working, a horse should drink plentifully; but if he will not drink warm water he must be indulged with cold, rather than not drink

at all. It is a very pernicious custom to purge horses often; for it weakens their constitutions, depraves the blood and humours, and hinders digestion. Every purge abrades in some degree the mucus of the intestines, and procures an extraordinary secretion of the bile and pancreatic juice. The constitution therefore languishes under this loss, when the drains of these salutary fluids are too frequent; for unless they exist in a sufficient quantity to mix with aliments, the digestion must be weakened, as they are absolutely necessary for the elaboration of the chyle.

OF CLYSTERS.

Mr. Clark observes, that clysters are of greater importance in relieving horses from many acute complaints than it is generally imagined; and it were to be wished, that, in place of the more extensive cordial drenches, &c. which are but too frequently given in most of these cases, a simple clyster of warm water, or thin water-gruel, were substituted; the latter proving of great benefit, whilst the former too frequently prove hurtful. They not only serve to evacuate the contents of the intestines, but also to convey very powerful medicines into the system, when it is not practicable to do it by the mouth: for although they are only conveyed into the larger intestines, and perhaps hardly penetrate into the smaller; still they are extremely useful, by fomenting the latter, and softening the hardened excrement accumulated in the former, and rendering it so soft as to be expelled out of the body, by which wind and all offending matters pent up in them are likewise expelled. Besides, by their warmth and relaxing power they act as a fomentation to the bowels: hence they may be of considerable service in removing spasmodic constrictions in the bowels, carrying off flatulencies, and preventing inflammation in the intestines, &c. or, by conveying opiates to the parts affected, give speedy relief in colics, &c. &c. The use of emollient clysters in fevers is considerable. They act by revulsion, and relieve the head when much affected. Besides, by throwing in a quantity of diluting liquor into the intestines, it not only relaxes and cleanses them, but cools the body in general; at the same time, a considerable portion of the liquid is absorbed and conveyed into the mass of blood, by which means it is diluted; and, in particular complaints in the bowels, clysters give almost immediate relief, as the remedies, when judiciously prescribed, pass immediately to the parts affected, with little or no alteration from the powers of the body. In administering clysters, it ought always to be observed, that the contents of the clyster be neither too hot nor too cold, as either of these extremes will surprise the horse, and cause him to eject it, before it has had any effect. The composition of clysters should be extremely simple: on that account they will be easily prepared, and as easily administered, provided the operator is furnished with suitable instruments for the purpose. The generality of clyster-pipes that are used, are by far too small, and too short. It may appear a kind of paradox, yet it is a fact, that a clyster-pipe which is of a larger size than the ordinary ones, and of a proper thickness, is much easier introduced into the anus, than one considerably smaller. It is likewise obvious, that when the pipe is too short, it renders clysters of no use, because it cannot convey the clysters so far up into the intestines as is necessary for them to be retained; a small short pipe of six or eight inches long, is not capable of conveying the injection to the end of the rectum, which, in a horse of a middling size, is about 16 or 18 inches long. The smallness of the bag, which is generally proportioned to that of the pipe, is another very material objection to these instruments, as it seldom contains one quart of liquid; from which circumstance, very little benefit can be derived from the use of them in such large intestines as those of a horse. Dr. Bracken very judiciously observes, that "the colon of a horse seems to be three guts, by reason of the two necks of about half a yard each; is drawn up into many cells or purses by means of two ligaments, one of which runs along the upper, and the other on the under side of it, which, with the assistance of a valve or flap at its beginning, hinder the excrements either from returning back into the small guts, or falling too soon downwards, before the chyle or milky substance prepared from the food be sent into its proper vessels. And, indeed, the cæcum seems to be so contrived in the manner of a valve, to hinder the aliment and chyle from passing too soon into the colon; for, it is evident, that if the aliment and chyle were not in some measure hindered in their passage through these

these large guts, the body could not be sufficiently supplied with nourishment. The first of these colons is about a yard and a half in length, the second about a yard, and the third, or that part which joins the rectum, near six yards in length; so that the colon of a horse 14 hands high, may be said to be nearly $8\frac{1}{2}$ yards long; and, from it, along the rectum to the anus, where the excrements are discharged, is not above half a yard; so that it is plain, clysters operate mostly in the colon; though I must say they are given in too small quantities; for what signifies two quarts of liquor in a gut nine yards long, and four or five inches diameter, in a natural state; but in the colic, it is so distended with flatulencies, that its diameter exceeds seven or eight inches, as I have frequently observed in those dying of that distemper." The most proper instrument for giving clysters, is a simple ox's bladder, which will hold two or three quarts, tied to the end of a wooden pipe about 14 or 15 inches long, one inch and a half diameter where the bag is tied, and of a gradual taper to the extremity, where the thickness should suddenly increase, and be rounded off at the point, and made as smooth as possible; the perforation or hole through the pipe may be made sufficiently large, so as to admit the end of a common funnel, for pouring in the liquor into the bag. By the flexibility of the bladder at the end of this instrument, no danger can happen to the horse; the clyster is conveyed so far up into the intestines that it will be retained; it causes no surprise (providing the liquor be neither too hot nor too cold, but milk warm,) as no other force is required to throw it up than the holding the bag a little higher than the level of the pipe; by which means the liquor flows gently into the gut, without any surprise to the horse. After using the bag, it may be blown full of wind, a cork put into the pipe, and hung up in some dry place to prevent it from rotting; by which means it will last a considerable time.

OF ROWELS AND SETONS.

Rowelling is an artificial vent made between the skin and the flesh, designed to carry off the humours, which are the cause of various diseases, by revulsion and derivation; and serves the same purposes as setons and issues in men. The method of introducing them is by making an incision through the skin, about three-eighths of an inch long, and then separating the skin from the flesh with the finger, or with a blunt horn, all round the orifice, as far as the finger will easily reach; then introducing a piece of leather, very thin, shaped round, about the size of a crown-piece, having a large round hole in the middle of it. Previous to introducing the leather, it should be covered with lint or tow, and dipped into some digestive ointment; a pledget of tow, dipped in the same ointments, should likewise be put into the orifice, to keep out the cold air: the parts around it soon swell, which is followed with a plentiful discharge, from the orifice, of yellow serum or lymph; and in two or three days at most, the discharge turns into thick gross white matter: the rowel is then said to suppurate. Rowels should be placed (especially in some particular cases) as near the affected part as possible; and, at all times, they ought to have a depending orifice, in order to admit a free discharge of matter. The parts where they are inserted to the greatest advantage, are the belly, inside of the thighs, the breast, and outside of the shoulders and hips. Rowels are of great use in many cases, as they empty the surrounding vessels by a regular slow discharge of their contents, and are even of great service when there is a redundancy or fulness of humours in general, which may require a gradual discharge, in preference to greater evacuations by purging medicines, &c. But though they are frequently beneficial, yet, like a number of other operations common to horses, they sometimes, by the improper use of them, become hurtful to the constitution; and, in some diseases, they often, instead of suppurating, turn gangrenous. Thus, in violent fevers, where they are frequently very injudiciously applied, they never suppurate properly: whether this proceeds from the quickness of the pulse, together with the violent rapidity with which the fluids in general are then carried through the vessels, or from the violent agitation into which the whole system is thrown, it is difficult to determine; but experience confirms the observation. In such cases, the surrounding parts, where the rowel is placed, seldom or never swell (as in the ordinary course, when they suppurate properly,) but appear dry, or much in the same state as when they were first put in; there is little or no discharge from the orifice; and the little that does come is thin, ichorous, and bloody. In such cases, they

ought to be taken out immediately, and the parts well fomented with a strong infusion of camomile, or an emollient poultice applied. Setons are cords, introduced by long, thin, sharp-pointed, instruments, or needles, shaped like a dart at the point, and having at the other extremity an eye to receive the end of the cord, which is to be left in the tumor. The size of the instrument may be determined by that of the tumor, and the thickness of the cord which is to follow it, and which ought always to be smaller than the perforation made by the point of the needle. Every practitioner in farriery should always have a number of these needles by him, of different sizes, that is, from 6 to 14 or 15 inches long, a little bent on the flat, or under side. The following is the method of applying setons in cases of tumours, &c. When the matter fluctuates in the tumor, the needle, armed with a cord at the other end, is to be introduced at the upper part of it, and the sharp point of the instrument directed to, and brought out at the under or lowermost part of the tumour, including the whole length of it; or, if needful, through the sound muscular flesh on the under part, in order to make a depending orifice for the matter to run freely off: the cord should be dipped in some digestive ointment, and then tied together at both ends with a thread, to prevent its slipping out. But if, from the length of the perforation, the cord should not admit of being tied together at the ends, a small button of wood, or some such substance, may be fixed at each end: only, from this circumstance, the cord will require, when shifted, occasionally to be drawn upwards and downwards; whereas, when the ends of it are tied together, it forms a circle, and may always be shifted downwards to the lower orifice. When the needle for introducing the seton is to pass near any large blood-vessels or nerves, to prevent their being wounded, it may be concealed in a case, open at both ends; and after an opening is made at the upper part of the tumour sufficient to admit the needle with its case, it may be directed with safety to pass the blood-vessels, &c. it may then be pushed forward through the canula and the opposite side of the tumour, and, having only the common teguments to perforate, all danger will be avoided. When the matter in the tumour appears to be wholly discharged or dried up, and no thickness appears but where the cord is, it may then be cut out, and the orifices suffered to heal up. Setons are of great use in carrying off matter from deep seated tumours or abscesses in different parts of the body. They ought always to be preferred to making deep incisions into the muscular parts, which not only disfigure horses, but are very difficult to heal up.

OF ALTERATIVE MEDICINES.

By alteratives are to be understood such medicines as, having no immediate sensible operation, gradually gain upon the constitution, by changing the humours or juices from a state of distemperature to health. Many have but an indifferent opinion of a medicine that does not operate externally; and gratify their senses with a quantity of imagined humours ejected from the body: but though the different secretions may be more or less increased, according to the nature and quantity of the stimulus applied to the secreting vessels, and the evacuations by sweat, urine, dung, &c. in some measure regulated thereby, yet no evacuating medicine has a power of selecting or separating the bad from the good; and consequently they are thrown out only in a proportionate quantity. Where a continued use of evacuates is necessary, none are so proper as alteratives, and what we have said respecting a too frequent repetition of purges, may be sufficient to convince the judicious reader, of the great advantages arising from this class of medicines; and the preference due to them in most cases over purgatives. We shall therefore recommend some alterative medicines which are of general use, and which possess peculiar advantages, as is found by a proper experience of their good effects in repeated trials. The first is nitre, or purified salt-petre, which has long been in great esteem, and perhaps is more to be depended on in all inflammatory fevers than any other medicine whatever: but besides this extensive power of allaying inflammatory disorders, it is now offered as an alterative remedy, taken in proper quantities for surfeits, molten-grease, hide-boundness, grease-heels, &c. And as it has been known to succeed even in the cure of the farcy, what other distempers in horses, arising from vitiated fluids, may it not be tried on, with a strong probability of success? This great advantage will arise from the use of this medicine over most others, that, as its operation is chiefly by urine, it requires no confinement or clothing;

cloathing; but the horse may be worked moderately throughout the whole course. This medicine has been found equally efficacious (by many trials made in one of our hospitals) in correcting the acrimony of the juices, and disposing the most obstinate and inveterate sores to heal up; and hence probably it came recommended as an alternative to our horses. The quantity of nitre, when given as an alternative, should not exceed two ounces in the day; one ounce morning and evening, being sufficient for a dose. Dissolved in a pail of water it will be very little perceptible to the taste; and being thus largely diluted will occasion no uneasiness in the stomach; but if he refuse it in his water, it may be given in a ball. Antimony is another capital article in this class of medicines. An ounce may be given every morning to a horse, along with his feed of oats. Crude antimony finely levigated, the crocus, precipitated sulphur, and the wine, for internal use; and the butter of antimony for external use, are the only preparations of this mineral necessary to be retained for the purposes of farriery.

OF THE METHODS USED TO PRESERVE THE FEET.

The custom of keeping horses constantly standing upon dry litter and hot dung in the stable, is exceedingly hurtful to the feet and legs, particularly the former, which are always found to agree best with coolness and moisture. Hence the hoofs of the horses that run in the fields are always in better condition than those that are kept hot and dry in the stable; which, besides being liable to many diseases, are hard, brittle, shattered, and often broken. With respect to greasy and oily applications, so often prescribed for the hoofs of horses to preserve them sound, tough, &c. Mr. Clark, in his *Observations on the Shoeing of Horses*, and on the *Diseases of their Feet*, very justly condemns them as rather pernicious than salutary. When young horses, he observes, are first taken from the fields, their hoofs are cool, sound, and tough. These are found from experience to be good qualities. But horses are no sooner introduced into the stable than their hoofs are greased or oiled two or three times a week; and if they are kept much in the house standing upon hot dry litter, without being frequently led abroad, and without having an opportunity of getting their hoofs cooled and moistened in wet ground, their hoofs grow so brittle, dry, and hard, that pieces frequently break off, like chips from a hard stone; and, when driving the nails in shoeing, pieces will split off, even although the nails are made very fine and thin. But if these same horses with brittle shattered hoofs are turned out to graze in the fields, their hoofs in time will become as sound, tough, and good, as they were at first. This change must undoubtedly be ascribed to the wet and moisture which the hoofs are exposed to in the fields, of which water is the principal ingredient; and it is a certain fact, of which we have daily proofs, that when all other means fail, horses turned out to grass will recover their decayed brittle hoofs. The dealers in horses about London, when they get a bad-footed horse, moisten his hoofs frequently in water; for which purpose, they keep a puddle of water and dung at the watering place, that, when the horse comes to water, his fore-feet may sink in the puddle, by which means they are cooled and moistened twice or thrice a day; so that, whilst they are making up his carcass for the market, his hoofs are likewise repaired, and sufficient to stand the test of a trial upon sale. But no sooner do horses with hoofs of this kind come into other hands, their hoofs at the same time being kept dry and greased, &c. than they degenerate into their former state. Hence the cause of so many complaints that horses turn soon lame after they come from dealers, when, in fact, it proceeds from greasy applications, and neglecting to cool or moisten the hoofs in water; for the careful groom, when airing his master's horses, rather than lead them into a puddle, will go about in order to keep their legs clean and dry. To preserve the feet of horses, the method which nature suggests is, to cool and moisten the hoofs with water morning and evening: and to those who are fond of stuffing, we would prescribe bran and water, or clay, &c. made into the consistency of a poultice; and in particular cases, where horses stand much in the stable, and the hoofs are disposed to be very hard, dry, and brittle, a poultice of this kind, or any other emollient composition in which water is a principal ingredient, may be applied all round the hoof; or, in imitation of some dealers, to keep a puddle of water at the watering place, which will answer equally well, if not better. From this manner of treatment, the hoofs will be preserved in their natural state, and a

free and equal perspiration kept up, by which the nourishment natural to the hoof will have free access to its surface; as it is this only which causes that cohesion of the parts, which constitutes a firm, sound, and tough hoof.

OF SHOEING HORSES.

The shoes cannot possibly be made too light, provided care be taken that they be of a thickness so as not to bend; for bending would force out the nails and ruin the hoof. That part of the shoe which is next the horse's heel, must be narrower than any other, that the stones may be thereby prevented from getting under it, and sticking there; which otherwise would be the case; because the iron, when it advances inwardly beyond the bearing of the foot, forms a cavity, wherein the stones being lodged would remain, and, by pressing against the foot, lame the horse. The part of the shoe which the horse walks upon should be quite flat, and likewise the inside of it; only just space enough being left next the foot to put in a picker, (which ought to be used every time the horse comes into the stable,) and also to prevent the shoe's pressing upon the sole. Four nails on each side hold better than a greater number, and keep the hoof in a far better state. Several modern authors, particularly Osmer, instead of attempting to improve the horse-shoe, propose to lay aside the use of it altogether, for which they are severely censured by Mr. Taplin. They "seem," says he, "extravagantly fond of an idea borrowed from antiquity, upon the practicability of horses travelling the road, and doing their constant work, without any shoeing at all." Osmer insists "that horses are adequate to their different services in a state of nature, without the officious obtrusions of art;" venturing to affirm "that they will travel even upon the turnpike roads about London, without injury to their feet." Mr. Taplin, however, observes, that "such economical plan may be admirably calculated for the theoretical journey of some literary speculatist, but affirms that no such excursion can take place of any duration, without material injury to the hoof, unless to the high-bred horses of authors, who enjoy their journeys only in imagination." Mr. Coleman, the present ingenious professor at the Veterinary College has made a material improvement on the horse-shoe. In his public lectures he observes, that, for a good natural foot, all that is required of a shoe, is to guard the crust by a small and narrow piece of iron, which should be attached principally towards the toe, and should not be extended so far back as the heel. The sole itself should not be covered by the shoe; for dirt and stones will get between, and will form a permanent and partial pressure on the sole, which will produce disease. According to the present mode of shoeing, those diseases which affect the horse's foot constantly take place on that portion of it which is covered by the extended breadth of the shoe, while the exposed parts remain uninjured. The reason is, that the covered parts, besides being exposed to permanent pressure from the cause already related, become tender by being covered. If these parts, therefore, are exposed, they get hardened and thick; and if the horse happens to tread on a hard and rough body, the inconvenience is but momentary, and the pain will make him remove his foot, so as to prevent mischief. Common shoeing is very liable to produce corns by the hoofs spreading out, and leaving the shoe in close contact with the sole, where it acts as a fixed point, and will not allow the elasticity of the insensible sole to act. The nails of the shoe should not be placed near the heels, for it disposes the heel to contract, especially when the bars are cut away. Mr. Coleman has the shoes made three times as thick at the toe as at the heels, because they wear more forward than behind. By this means the heels are less oppressed with weight, and the frog is allowed to come down to the ground: a matter of extreme importance. The nails are all placed forward, four on each side, but not approaching too near the heels, that they may not obstruct the elastic powers of those parts. The old method of fullering, *i. e.* making a groove in the shoe, being found injurious, by often breaking away the heads of the nails, they are now counter-sunk in conical or wedge-shaped holes, so that they may be driven up close to their thickest parts, and be out of the way of accident. By this means the nails and shoes appear as one body, and always wear together. For horses which go in shafts, or are used in hunting, it is usual to make shoes with only one heel, which should be outward. The horse's heel must be rather lowered on that side, and the inner heel of the shoe somewhat thickened so as to balance and bear equally. By this

easy precaution a good footing is obtained, and cutting is effectually prevented. The best breadth for the shoe of a medium sized horse is said to be one inch at the toe, and three quarters at the heel; the weight about eighteen or twenty ounces. Light saddle horses should not have shoes exceeding sixteen ounces; and, unless local circumstances prevail, twelve ounces will be generally found preferable. In order to fit the shoe without causing the horse to stand too much on his heels, the under part of the crust, or wall of the hoof, is pared away to receive the excess of thickness in front; for the bottom of the shoe ought to be perfectly flat, without any stubs or calkings in front. Paring away the heels is a most destructive practice, except in case of absolute excrecence in those parts; nor should the bars (or diagonal ridges) that extend from the heels to the frog, or central projection, ever be cut more than is absolutely proper for the purpose of keeping them in a clean and healthy state. Fig. 8 and 9, in Plate LXVIII. represent the form of modern shoes. When the roads are covered with ice, it is necessary to have the heels of a horse's shoes turned up, and frequently sharpened, to prevent him from slipping and falling; but this cannot be done without the frequent moving of the shoes, which breaks and destroys the crust of the hoof where the nails enter. To prevent this, it is recommended to those who are willing to be at the expence, to have steel points screwed into the heels or quarters of each shoe, which might be taken out and put in occasionally. To do this properly, Mr. Clark advises, first to have the shoes fitted to the shape of the hoof; then to make a small round hole in the extremity of each heel, or in the quarters, about three-eighths of an inch in diameter, or more, in proportion to the breadth and size of the shoe; in each of these holes a screw is to be made; the steel points are likewise to have a screw on them, exactly fitted to that in the shoes. Care must be taken that the screw in the points is no longer, when they are screwed into the shoe, than the thickness of the latter. The steel points are to be made sharp; they may either be made square, triangular, or chissel-pointed, as may be most agreeable; the height of the point above the shoe should not exceed half an inch for a saddle-horse; they may be made higher for a draught horse. A key for screwing them in and out occasionally is necessary, it must have a cavity properly adapted to the shape of the steel point, and sufficiently large to receive the part above the shoe. To prevent the screw from breaking at the neck, it is necessary to make it of a gradual taper; the same is likewise to be observed of the female screw that receives it, that is, the hole must be wider on the upper part of the shoe than the under part; the sharp points may be tempered, or hardened, in order to prevent them from growing too soon blunt; but where they become blunt, they may be sharpened as at first. These points should be unscrewed when the horse is put into the stable, as the stones will do them more injury in a few minutes than a day's riding on ice. A draught horse should have one on the point of each shoe, as that gives him a firmer footing in drawing on ice; but for a saddle horse, when points are put there, they are apt to make him trip and stumble. When the shoes are provided with these points, a horse will travel on ice with the greatest security and steadiness, much more so than on causeway or turnpike roads, as the weight of the horse presses them into the ice at every step he takes.

OF FIRING, CROPPING, NICKING, AND DOCKING.

The cautery is also an instrument of prime consequence in veterinary practice; but the firing the legs of horses is yet performed by the generality of common farriers in a heavy-handed, rough, and barbarous way; the old method of drawing cross lines ought to be abolished. Indeed the general rude and unfeeling modes of treating this animal, by whose services mankind are so much benefited, form a proper subject of instant inquiry, and attempts at gradual improvement. Common farriers and grooms, from inveterate habit and total absence of reflection, look upon the animal, placed by stratagem and force within their power, as a mere piece of machinery, the feelings of which never disturb the straight-forward aim of the operator, for indeed they never come within his contemplation: on the contrary, he generally views his victim, bound down to the most infernal and exquisite tortures, with a kind of triumph, or even strongly-marked features of revenge, if the wretched beast has given him much trouble. The heavy and bungling methods of common operators increase tenfold the necessary sufferings of the horse. Thus an author, whom

we have repeatedly quoted, relates that he saw a mare's lip twitched with such violent force, that it burst asunder; and the agony of the twitch being so exalted, its intent was frustrated, and the mare threw herself upon the ground. The burning off with a lighted candle the hair of the horse's lip, beneath the jaw, and within his ears, is generally a most terrifying process, and renders many horses dangerously shy about the head; besides, the robbing that delicate organ, the ear, of the natural protection of its inner part, is most improper, unnecessary, and cruel. Such practice should never be permitted for a moment; the scissors will do every thing in the case which neatness and symmetry require. The cruel operations of nicking the tails of horses it is almost useless to declaim against, from its present general adoption; but we really can discover no reason why an erected tail should be deemed essential to beauty of figure on the road or field, more than on the turf, for which purpose horses are never nicked. Yet it seems necessary to dock or abridge the tail of the horse destined for the saddle at least; but as it is always a severe, and often a dangerous, operation to a full-grown horse, we recommend Mr. Lawrence's practice of taking off a hand's-breadth of the colt's tail while it sucks, at a month or two old. He says he has repeatedly performed this trifling operation with a sharp knife; the patients being so little disturbed by it as to continue feeding on the same spot: nor was it always necessary to bind up the wound. Although no friend to cropping, he has been tempted to crop a large, heavy, lopping, ear in a yearling; judging it best to crop early, if at all. As Mr. Lawrence's treatise contains hints of peculiar utility, we will quote certain of them in this place: he strongly recommends that all cart-colts may be taught to back when they are first taken in hand; as a preventative of much future misery and barbarity. That the keepers of post-horses would, as far as lies in their power, be careful to select postilions of light weight; and that they would attach a convenient seat to the splinter-bar of their post-chaises, for the use of the postilion, whenever he can obtain leave of humane passengers to ease his horse, by seating himself on the bar. Mr. Lawrence also recommends a covering for the knees, to preserve them in case of an accidental fall, or in case of a recent wound by a fall: this is of particular use to race-horses and hunters, or sale horses on travel. He farther counsels, that saddle colts, in their breaking, be taught and accustomed to a steady canter, a thing generally unthought of.

OF THE INTERNAL DISEASES OF HORSES.

OF FEVERS IN GENERAL.

A fever is a general disease, which affects the whole nervous system, and disturbs all the functions of the body; nor are the solids free from its dire effects. The motions of the heart and arteries cease to be regular and equal; the circulation of the blood to be free and natural; and the secretions and excretions are no longer rightly performed. Horses may be attacked by this distemper at all ages, whether running at large in the fields, or kept close in the stable. Sometimes it is epidemical, seizing great numbers at the same time; sometimes symptomatical, being a consequence of other diseases, and rendering them more dangerous and difficult to be cured. A fever, properly speaking, does not consist merely in an accelerated pulse, or a more frequent beating of the heart, as this may happen from hard riding, or any thing else that puts the blood and spirits into a commotion. That only can be called a fever, which proceeds from internal causes, and is attended with coldness of the external parts. In men there is generally a shivering, and probably also in horses, though it is seldom or never taken notice of, because it can hardly be discovered till the disease is confirmed.

I. SIMPLE FEVER. In a simple fever, all the internal parts continue sound, and there is no inflammation, or inflammatory tumour, that may occasion it. This is the mildest and least dangerous of all fevers, and is generally owing to a suppressed perspiration, which increases the quantity of humours, and thereby requires an increased effort of nature to throw them off, and to remove the obstructions; whence a feverish habit will follow, which, if taken in time, by assisting the endeavours of nature, may go off without any bad consequences. There is nothing so likely to cause this fever, as a sudden refrigeration of the body, after it has been violently heated. The symptoms of a simple fever are, a

loss of appetite, in such a manner, that the horse only nibbles his hay, as if he did not like it; and he is so restless as to be continually ranging from one end of the rack to the other: he has a beating of his flanks, a redness of his eyes, and dryness of his tongue, which is somewhat parched; and his ears and feet are not cold, as in complicated fevers, but are almost as warm as the rest of his body. He is not costive, but his dung by internal heat is dried into small balls, and is seldom or never greasy: his urine is of a high colour, and is sometimes voided with difficulty. He seems to be fond of water, yet drinks but little at a time, and often. His pulse beats full and hard, to 50 strokes and upwards in a minute. The indications of cure are, to free the vital parts from the congested blood; to abate the heat of the blood and humours; to allay the inordinate motion of the solids; to discuss the stagnant and corrupted humours; and procure a free circulation, by recalling the blood to the external parts. Therefore we must begin the cure by taking away a sufficient quantity of blood. The longer this is neglected, the more viscid and acrimonious is the blood rendered, by dissipating its more thin part, condensing the globules, and heating the serum to such a degree, as to turn it into a kind of jelly. The acrimony of the oleous and saline parts of the blood will be increased more and more, insomuch that the blood will be at length highly contaminated, and so far depraved as to be unfit for the purposes of life. The quantity of blood to be taken away must be in proportion to the strength of the horse, the intensity of the fever, the heat, and the violence of the symptoms. In general, three pints or two quarts may be sufficient; and if the symptoms are not abated by the first bleeding, it shews a necessity of repeating the operation, especially if he refuse to feed. However it is safer to take away too little than too much. When the horse is disposed to drink, it will be always proper to let him have a sufficient quantity to keep his blood well diluted; otherwise, as the preternatural heat dissipates the thinner part, without a sufficient quantity of fluid, the serum of the blood will be concreted into a jelly. This should be made with warm milk and water, mixed with a little oatmeal. He may likewise have the drink, No. 16. His diet should be scalded bran to keep his body open, and he may be allowed half a quartern three or four times a-day, if he will eat it. But if he refuse it, let him have raw bran sprinkled with water. He should never get much hay at a time, but a small quantity of good hay may be given to him frequently. His water needs not be much warmed, but should be given often and in small quantities: his cloathing should be moderate; too much heat and weight on a horse being improper in a fever, which scarce ever goes off in critical sweats (as those in the human body terminate,) but by strong perspiration. Besides bleeding and the nitrous cooling drink, it will be proper to inject cooling, emollient, and laxative clysters, even at the very beginning, to bring away the hardened faeces that are pent up in the intestines, and to discharge any bilious acrid matter, which might enter into the blood through the lacteals. Saline purges are also proper, being cooling and gentle in their operation and preferable to aloetic purges in fevers. The drink, No. 14, is as good a general formula as can be contrived, in almost all cases where such medicines are indicated. The signs of recovery are, the horse eating scalded bran, and picking a little hay, which, when he does, he needs only to be taken care of and well nursed, without troubling him with any more medicines. For though a horse continue to heave at the flanks, this is no bad sign, especially if he be cool all over, and has a return of appetite. He should now be taken out in the air every day, and led about by the hand. He should also have plenty of clean straw to lie down on.

II. Low, putrid, and malignant fever. This is of a more complicated and irregular nature than the former, and if not properly treated often proves fatal. It seldom rises to that degree of heat, that attends inflammatory fevers, but creeps on gradually, while nature endeavours to get rid of her enemy, sometimes by one outlet, and sometimes by another; insomuch that we are not able to determine which of the secretions to promote, and this renders the method of cure very precarious and uncertain. These sorts of fevers have been often mistaken for severe colds, which has produced fatal errors. And indeed it requires the highest skill in farriery, to treat these diseases in a proper manner, and prevent them from ending in a consumption. All kinds of irregularities, whether in diet, rest, exercise, or labour, when long continued,

may produce these fevers; as they all tend to generate bad humours, deprave the blood, and depress the spirits. The only way, therefore, to prevent them, is to keep the horse from excesses of all kinds: for what tends to preserve his due temperament, is the best means to preserve him from diseases in general, and this kind of fever in particular. When this fever begins to appear, the horse feeds but little, eating a mouthful or two, and then leaving off; he has a constant moisture in his mouth, moves his jaws in a feeble manner, and has a disagreeable grating of his teeth. The fever is attended with a depression of spirits, which is at some times more remarkable than at others. His heat is variable; sometimes none appears outwardly, but rather a remarkable coldness: at other times he is hot all over, but not to a great degree. His eyes are generally moist and languid; his body is open; his dung soft and moist, but seldom greasy. His staling is irregular; sometimes very profuse, and at other times very little. His urine is generally pale, without a sediment, and very seldom high coloured. With regard to prognostics, if the fever sensibly abate, and his mouth grow more dry, the grating of his teeth ceasing at the same time; if his appetite mend by degrees; if he begin to lie down, (which at first he seldom does,) for a week, or a fortnight, or longer, these are promising signs. A horse in these fevers always runs at the nose, but not the kindly white discharge, as in the breaking of a cold, but of a reddish or greenish dusky colour, and of a consistence like glue, that sticks like turpentine to the hair on the inside of the nostrils: if this turn to a gleet of clear thin water, the horse's hide keep open, and he mend in his appetite, there is no doubt of his recovery, unless through bad management. While the disease is in a moderate state, he will feed, though but poorly; his urine will be pale and thin without any sediment; his dung will be sometimes loose, and sometimes hard; his mouth will continue moist, with a redness and sponginess about the roots of his teeth; his skin will sometimes feel dry, and sometimes moist and damp, with a roughness of his coat. While the horse remains in this state, proper medicines will in all probability work a cure. But if his appetite be constantly upon the decline, and go off gradually, till at last he forsakes every kind of food, while his fever continues or increases: if the horse be old, with poor rapid blood, or have lately met with any severe accident, little good is to be expected, unless by the consummate skill of the person who takes care of him. The various and irregular symptoms, that attend this slow fever, require great skill to direct the cure, and more knowledge of the symptoms of the diseases of horses, than the generality of gentlemen are acquainted with. The experienced farrier should therefore be consulted and attended to, in regard to the symptoms; but very seldom as to the application of the remedy, which is generally above his comprehension; though it may be readily selected, by duly attending to the observations here inculcated. The cure of this disease may be begun by bleeding; but the quantity of blood to be taken away must be regulated according to the symptoms. When the horse is plethoric, and there is a redundancy of blood and humours, two quarts at least may be taken, and that as soon as possible; if the horse be in a moderate condition, a quart or three pints will be sufficient; but if he be old, poor and low, it will be dangerous to take away any at all. In general, when there is any symptom of inflammation, it is necessary that the horse should lose blood, let his condition be what it may. The greatest danger in this distemper arises from supposing the horse to have little or no ailment, till he is too far gone for a cure, because he will keep picking and eating his hay, during the first stage of his disease. Afterwards, if he be allowed oats, he will eat nothing else, till his appetite quite forsakes him. Therefore, if his disease be discovered in due time, instead of oats he should have scalded bran; and if he refuse this, he should get a little raw bran sprinkled with clean water, and some good hay put into his rack by handfuls. But if he be neither willing nor able to lift his head to the rack, it may be given by the hand, to tempt him to eat. As drinking is absolutely necessary to dilute the blood, if the horse refuse to drink freely of warm water or gruel, he must be indulged with having the chill only taken off by standing in the stable: nor will any inconvenience ensue, but oftener an advantage; for the nauseous warmth of water, forced into horses for a time, palsies their stomachs, and takes away their appetites, which the cold water generally restores. Should the fever

fever after this treatment increase, the horse feed little, stale often, his urine being thin and pale; and his dung sometimes loose, and at other times hard; should the moisture in his mouth continue, his skin being sometimes dry and at others moist, with his coat looking staring and surfeited: upon these irregular symptoms, which denote great danger, the balls, No. 6, or the drink, No. 17, should be given, without delay, for in these cases there is no time to be lost. When the horse has so far recovered his strength, that he is fit to be taken out of the stable, lead him into the open air, which will contribute much to his speedy recovery. Costiveness is bad in all diseases, but particularly in those of the head and in fevers. When therefore the horse is in this condition, recourse must be had to emollient clysters or saline purges. If, on the contrary, the looseness should happen, it is often critical, and therefore should not be immediately stopped, if moderate; but if, by continuance the horse grow feeble, mild astringents and tonics must be administered. Particular regard should be had to his staling; which if in too great quantities, so as manifestly to depress his spirits, should be controlled by proper restraints, or by preparing his drinks with lime-water. If, on the contrary, it happen that he is too remiss this way, and stale so little as to occasion a fulness and swelling of the body and legs, mild diuretics such as No. 5, will be the most proper remedies. The signs of a horse's recovery are known by his hide keeping open, and his skin feeling kindly; his ears and feet will be of a moderate warmth, and his eyes brisk and lively; his nose grows clean and dry; his appetite mends, he lies down well, and both stales and dungs regularly. If he happen to have eruptions on his skin at this time, it is no bad symptom, but on the contrary, may prove very beneficial. Medicines will now be no longer necessary, as the completion of the cure depends more on proper attention to supply him with suitable diet and convenient exercise. As all tedious distempers weaken the digestive faculties, we may easily suppose a horse is not able immediately upon his recovery, to concoct the same quantity of food as before he was ill. It is therefore, obviously improper to give him as large feeds in his weak, though convalescent state, as formerly, when he was in perfect health and strength. This, it is alleged, will bring him to his flesh and strength the sooner; but it is a great mistake, and is in danger of causing a relapse; for though the horse's stomach be craving, and he appear greedy of food, yet as he will not be able to digest it, so as to enlarge the quantity of good chyle, he must necessarily generate crudities, which may occasion a relapse, or at least throw him into a surfeit, which may prove as bad. Hence the necessity appears of feeding sparingly at first, and of giving him provender by little and little, in proportion to his strength. He should also be aired every day; for fresh air is as necessary to restore all the functions as a proper diet; as is evident from the speedy effect a change of air has on the health and recovery of the human species. And then gentle exercise, increased by degrees, will bring him to his wind and flesh, by promoting a due distribution of the chyle, and a regular circulation of the fluids.

OF COLDS AND COUGHS.

We class these disorders together, because the second is generally the attendant on and consequence of the first. A cold in a horse is the same sort of disease as in a man. It is occasioned by the same exposure, and to be avoided by the same sort of cautions we think necessary for ourselves. To enumerate the various causes of colds would be endless: the most usual are, riding horses till they are hot, and suffering them to stand in that condition where the air is cold and piercing; removing a horse from a hot stable to a cold one, and too suddenly changing his cloathing; whence it is that horses often catch such severe colds after they come out of the dealers hands, and by not being carefully rubbed down when they come in hot off journeys. Where there is a constant attention and care, the effects of cold are not only soon discovered, but an observation may be very early made to what part it more immediately directs its attack. For instance, if the nervous system be the most irritable, the affection is quickly perceived in the eyes; if the glandular, upon the neck, throat, under the ears, or in the head; or if more particularly the system of circulation has been affected, the consequences are soon apparent upon the lungs; and will be exerted more or less in a cough, or

difficulty of breathing, according to the severity of attack, from the repulsion of respirable matter, and its consequent absorption into the circulation. As soon as the horse is in this state, a symptomatic fever attends; which is to be understood as no more than a degree of febrile heat or irritability dependent on the original cause, which gradually ceases as the primary disease is found to decline. From an affection of the different parts above specified, various disorders ensue, which are treated of under their proper heads. Here we have only to consider that kind of cold fixed on the lungs, which produces cough; and which, if taken in its first stage, generally yields to very simple remedies. With regard to prognostics, when the cough is strong, and the horse does not refuse scalded bran or warm water, at the same time pricking up his ears and moving briskly in his stall, it is a good sign; as also when he dungs and stales freely without pain. It is likewise a good sign, when his skin feels as in health, and when his mouth is moist without being clammy. But when his coat stales, it is a bad omen: when his mouth is hot, dry, and parched, and his belly tucked up, there is danger of a fever: when a horse feels hotter than ordinary, with a working at his flanks; when he will not eat his meat or drink his water; when his eyes are very moist, his mouth slimy, his ears and feet cold, there is danger of a malignant fever. As soon as the attack has been observed, bleeding should be instantly performed, according to symptoms, size, state, and condition; and the blood preserved a few hours to ascertain its state: if livid or black, with a coat of size upon its surface, there is no doubt of its viscosity, and of the obstructed circulation of that fluid through the finer vessels of the lungs. In three or four hours after bleeding, give a mash prepared as follows:—On equal parts of bran and oats, pour a sufficient quantity of boiling water, in which two ounces of Spanish juice, and four ounces of honey has been dissolved, and then stir in two ounces aniseed and liquorice powders; honey four ounces. In two hours after the mash give a gallon or six quarts of soft water moderately warm, in which has been dissolved two ounces of nitre. These mashes Mr. Taplin directs to be “continued every night and morning, giving a moderate feed of dry oats in the middle of the day, good sweet hay in small quantities, and the same proportion of nitre to be repeated in the water after each mash. To these must be added the necessary regulations of good dressing and gentle exercise, which in general soon effect the cure of such colds as are counteracted upon the first attack.” When the disorder has been neglected, and made a rapid progress, should the cough be violent and constant, the horse very dull and refusing his food, and the symptomatic fever run high, the blood will consequently prove as before described. In this case the symptoms will not perhaps yield to the above plan so soon as may be wished. It will therefore be necessary to repeat the bleeding in two or three days at farthest, according to circumstances. Continue the mashes and nitre as before directed; and give about four ounces of the cordial pectoral ball, No. 8, every morning. Malt may be substituted for oats in the mash, if thought more agreeable.

OF ASTHMA, BROKEN WIND, AND CONSUMPTION.

The consequences of colds, neglected or injudiciously treated, are settled habitual coughs, asthmas, broken wind, and consumptions. The asthmatic cough, which is distinguished by being short and dry, preceded by a husky hollow kind of wheezing, as if the respiration were obstructed by fragments of hay or corn retained in the passage, is not incurable, unless it have continued long, and the horse be old. Bleeding must be first performed, and occasionally repeated in small quantities, till the glandular inflammation and irritability are allayed, and the blood so attenuated by the constant use of nitre, as to render the circulation free through the finer vessels of the lungs, from the obstructions in which all the difficulties proceed. Bleeding having taken place with the necessary circumspection as to quantity, let two ounces of nitre be given punctually every night in the water, as particularized under the article COLDS, continuing one of the balls, No. 9, every morning for a fortnight or three weeks, that a fair and decisive trial may be obtained. This treatment, with the assistance of open air and moderate exercise proportioned to the horse's strength and constitution will bid fair to effect a cure in every case in which the disease is not too deeply rooted to re-

sist such powerful means of relief. When this distemper is so far confirmed, as to become what is properly called a broken wind, the inspirations are always more slow than the expirations; for they draw in their breath slowly, and their flanks fill up and rise very gradually, but fall again suddenly, because their breath is forced out through their mouths and nostrils with great rapidity, which shews a convulsive disposition of the parts designed for respiration. Most writers attribute the cause of this disorder to injudicious or basty feeding of young horses for sale; by which means the growth of the lungs, and all the contents within the chest, are so preternaturally increased, and in a few years so enlarged, that the cavity of the chest is not capacious enough for the performance of the necessary functions. There is great reason to disbelieve this doctrine altogether: but at least those who consider a broken wind in this light must own, that it ranks among the incurable diseases of horses; and that all the boasted pretensions to cure are vain and frivolous, since the utmost skill can amount to no more than now and then palliating the symptoms, and mitigating their violence. A much more probable cause of broken wind has of late been assigned by the anatomical professor at the Veterinary College, and one which is supported by the appearances on dissection. This is the breaking of the air-vessels into each other, so that a number of cells form one common bag, sometimes nearly the size of a hazel nut. Hitherto, unfortunately, no remedy for this disease has been hit upon; we shall therefore only lay down such methods as may probably prevent this disorder when pursued in time. But if they should not succeed, we shall offer some remedies and rules for mitigating the complaint, and making a horse as useful as possible under this malady. As a broken wind seldom or never comes on suddenly, but by degrees, it will be best to prevent, if possible, its coming to any height. Therefore when a horse has only a dry obstinate cough, and feels greedily at the same time, eating his litter and drinking heartily, it will be proper to bleed him in the plate or neck vein; then the mercurial ball, No. 2, should be given him over night, and purged off next morning; or it may remain two days before it is purged off. If given in a morning, he must fast two hours before and three after it: and then get a purge the next morning, or the morning following that. The same method may be repeated again in a week or ten days, twice or thrice. On the intermediate days he should have the detergent deobstruent balls, No. 10. Careful feeding and moderate exercise has greatly relieved broken winded horses. Horses sent to grass to be cured of an obstinate cough, have often returned completely broken-winded, where the pasture has been rich and succulent, so that they have had their bellies constantly full. As the ill consequences therefore are obvious, where one has not the convenience of turning out a horse constantly, he may be soiled for a month or two with green barley, tares, or any other young herbage. To pursue thick-winded horses, Barbadoes and common tar have often been given with success, to the quantity of two spoonfuls, mixed with the yolk of an egg, dissolved in warm ale, and given fasting two or three times a-week; especially on days when he works or travels. Two or three cloves of garlic given at a time in a feed, or three ounces of garlic bruised, and boiled in a quart of milk and water, and given every other morning for a fortnight, have been found very serviceable; for by warming and stimulating the solids, and dissolving the tenacious juices which choke up the vessels of the lungs, these complaints are greatly relieved. But to render broken winded horses of any real service, the most material point is to have a particular regard to their diet, observing a just economy both in that and their exercise; giving a moderate quantity of hay, corn, or water, at a time, and moistening the former, to prevent their requiring too much of the latter, and never exercising them but with moderation. When a consumption proceeds from a defect in a horse's lungs or any of the principal bowels, the eyes look dull; the ears and feet are mostly hot; he coughs sharply by fits; sneezes much, and frequently groans with it; his flanks have a quick motion; he gleans often at the nose, and sometimes throws out a yellowish curdled matter; he has little appetite for hay, but will eat corn, after which he generally grows hot. These symptoms, or at least most of them, will attend the abscess or corruption of any of the rest of the bowels, in the same manner as the hectic fever in mankind. The causes of this disease are schirrous tubercles which beset the

lungs, and are hard to be removed on account of their constant motion. These tubercles are full of a viscid matter, and are generally the beginning of vomica or abscesses of the lungs, which are contained in a kind of bag. When these break, they fill the lungs with a purulent matter mixed with phlegm, and then it is a true consumption. But these tubercles or schirrous knots may sometimes lie dormant a long while, without any other symptoms but a dry cough. But if these ulcerate at length, they turn to fistulous and cancerous ulcers, which admit no cure. As there is always some degree of an inflammation attends this disease, it is generally best to begin the cure with bleeding, and this should be but a little at a time, *i. e.* a pint every eight or ten days, while there is any probability of giving relief. Then make rowels in the sides and breast, to draw off the purulent matter from the part affected. With regard to internals, pectorals, as in colds, may be given to palliate present symptoms; but as dissections have discovered both the glands of the lungs and mesentery to be swelled and often indurated, the whole stress lies on mercurial purges and alteratives, given intermediately. There is nothing that will contribute more to the cure than good air and gentle exercise in a morning; and therefore, the horse should be removed from low, boggy places, when he happens to be kept in such. If he is turned out to grass, it should never be where it is rank, but on some dry common or other place where the air is good. But the best pasture is the salt marshes, where a horse will recover without the use of medicines, if his case is not desperate.

OF PLEURISY AND INFLAMMATION OF THE LUNGS.

A PLEURISY and PERIPNEUMONY, are inflammatory fevers, which arise from the stagnation of the blood and the bronchia of the lungs, or in the branches of the vena sine pari in the pleura. They are attended with a sharp pain in the side, difficult breathing, immoderate heat, a strong quick beating at the heart, and a cough. The pleurisy generally seizes one side only; but the peripneumony or inflammation of the lungs, generally seizes both sides of the lungs at once. The symptoms of a pleurisy and peripneumony are much the same, only in the former, the horse is more restless and uneasy, and shifts about from place to place, often turning his head to the affected side. The fever rises suddenly to a very great height in the beginning of this disease, and he often strives to lie down, but starts up again immediately. His ears and feet are burning hot, and his mouth parched and dry. As the disease advances, he does not offer to lie down at all, but runs back as far as the collar will let him, and then stands immovable, panting, or endeavouring to cough, till he drops down dead. This disease, at its first onset, has been frequently mistaken for the gripes, but may be readily distinguished from them; for in the gripes, the horse lies down and rolls, with his eyes turned up, and his limbs stretched out, as if he were dying with convulsive twitches. His ears and feet are not constantly hot, but are sometimes almost as hot as fire, and at other times as cold as ice. He also sometimes falls into profuse warm sweats, and then into cold damps; he stales and dungs with great difficulty, and the same symptoms continue till he finds relief. In an inflammation of the lungs, the horse is more dull and heavy, and never attempts to lie down at all; when his mouth is opened, a great quantity of ropy slime will fall therefrom; and a reddish or yellow matter sticks to the inside of his nostrils, from a gleet that runs from thence. There is no extraordinary beating in his flanks, nor is his belly tucked up as in the pleurisy. His ears and feet are generally cold, and he often falls into damp sweats. The cause may be any thing that impedes the free circulation of the blood through these parts, either by plenty of thick humours, or by thin acrid humours, which irritate the vessels to a spasmodic constriction, and so hinder the free passage of the blood; especially when the antecedent causes conspire to produce the same effect. Therefore it may be owing to bad or high feeding, want of exercise, being over-heated, hard labour, sudden cold, drinking cold water when hot, want of bleeding when the body is full of blood and humours; riding a horse deep in cold water when he is hot, or letting him stand long in a cold damp air, or when there is a very cold wind blowing; for all these have a tendency to render the blood and humours of that consistence, generally termed pleuritic. The cure of both these diseases is much the same, the intention of which is, to remove the stagnation of the blood, and to promote its equal circulation.

tation. For this purpose, we must endeavour to prevent the farther congestion of the blood, and to render it more fluid. There is nothing more proper to prevent the farther inflammation, than letting of blood as soon as possible, taking away three quarts at once; and if there be no great alleviation of the symptoms, two quarts the next day, unless they continue violent, and then bleeding may be repeated sooner; for speedy, large, and quickly repeated bleedings are in these cases chiefly to be depended on. But if the horse were low before he fell ill, or were pretty old, then take away a quart at once, and repeat it in 12 hours, and then the next day if the case require it. This operation when used in time, has often removed the disease of itself. The next thing to be done is, to rub the blistering ointment, No. 47, all over his brisket, into the foremost ribs, and when it is a pleurisy, into the pained side more particularly. Rowels also will be of great service when they digest in time. Therefore he may have one in the belly on the affected side, and one on each side the breast; but if he have a great motion of the flanks, that on the side will not come to digestion, and then it will be best to make one on each thigh on the inside. The diet and medicines should be cooling, attenuating, relaxing, and diluting. After the operation of bleeding, therefore, Mr. Taplin directs "to have ready some bran and very sweet hay cut small, and scalded together; which place hot in the manger, that the fumes may be imbibed as an internal fomentation to relax the rigidity of the glands, and excite a discharge from the nostrils as soon as possible. The very nature of this case, and the danger to which the horse is exposed, sufficiently point out the propriety and consistency of exerting all possible alacrity to obtain relief, or counteract the disease in its first stage: therefore let the fumigation of scalded bran and hay be repeated every four or five hours, and the decoction No. 17, prepared without delay. If relief be not soon obtained, and the horse be costive, give the clyster, No. 21. Should the symptoms still continue violent, without discovering any signs of abatement; after waiting a proper time for the effect of previous administrations, let the bleeding be repeated, in quantity proportioned to the urgency of symptoms, continuing the decoction and nitre every three or four hours, and repeating the clyster if plentiful evacuations have not been obtained by the former injection.

OF THE GLANDERS.

The glanders are known by a running of matter from the nostrils, which is either yellow, or greenish, or tinged with blood. When the disease is of a long standing, the matter turns blackish, and becomes very stinking. It is always attended with a swelling of the glands, or kernels, under the jaws. When there is a swelling which shews that matter is forming under the ears, jaws, or about the root of the tongue, let every possible method be taken to produce a suppuration and discharge of matter; for, in most cases, an external evacuation becomes the crisis, and is greatly preferable to the chance of mischiefs that may be produced by the morbid matter being absorbed into the system. Should a cough, difficulty of breathing, or a great degree of inflammatory heat, attend, draw blood from a remote vein in moderate quantity, to mitigate either of those symptoms; and when the swellings about the parts have acquired an evident prominence, foment them twice a-day, for two or three days, with flannels wrung out of warm water. In two or three days a judgement may be formed whether a suppuration is likely to take place. If so, the tumours will increase in size, and feel soft and yielding in the middle when pressed; in which case apply the poultice, and proceed as directed for the STRANGLES. If, on the contrary, the swellings continue hard and immoveable, a running coming on at the nose; observe whether the matter is of a white colour and without smell, or is of different tinges, and streaked with blood. The former is a favourable sign; and in that case the treatment may be as directed for COLDS and COUGHS. But if the matter should prove of the latter description every precaution ought to be instantly used, to prevent in its infancy what would soon become a case of so much trouble. To soften the viscid matter in the passages, and relax the inflammatory stricture of the glands, prepare a vapour bath of rosemary, lavender flowers, southernwood and marjoram (each) a handful, boiled in two or three quarts of water. Put this into a pail, and let the horse's head be fixed over it as near as can be borne, and so long as the fumes passing up the nostrils can be supposed to take

effect as an internal fomentation. This operation should be repeated twice every day; and much of the treatment recommended under coughs and strangles with glandular discharges from the nostrils, will at the same time appear proper to be observed, as being applicable to many of the present symptoms. Let it be particularly remembered, that, during the whole course of management, the head of the horse is to be kept as warm as possible, and in proportion much more so than the body, either in a double kersey hood, or a single external, and a flannel one underneath; as nothing can contribute more to a solution of the humours and promotion of their discharge, than a critical relaxation of the pores, particularly upon the very seat of the disease. In case the discharge should continue to increase in quantity and virulence, becoming still more discoloured, and its smell very offensive; besides continuing the fumigation, let half a gill of the following injection (milk warm) be thrown up either nostril, or both if the matter should be so discharged with a strong forcible syringe, three or four times a day. Linseed, an ounce; camomile and elder flowers, each half an ounce; water, three pints. Boil for a few minutes; then strain off, and add to the liquor 4 oz. of mel *Ægyptiacum*, mixing well together at each time of using. If after every effort the matter still continue malignant, there will be little hopes of recovery, and as Mr. Talpin observes, the first loss will be ultimately best, in a resignation of his hide to the collar-maker, and his remains to the hounds.

OF THE STRANGLES AND VIVES.

The STRANGLES is a disease that attacks young horses, chiefly before six years of age; and is somewhat analogous to the quinsy. It is a swelling under the throat between the jaw-bones, and its principal seat appears to be the muscles of the tongue, wherein there is an inflammation, and therefore it seems to differ from a quinsy in the seat of the distemper only. The symptoms and progress of this disease are as follow: a heaviness and inactivity, loss of appetite, and a hollow husky cough, occasioned by the irritability of the inflamed glandular parts in the throat and about the root of the tongue. To excite a degree of moisture in the mouth that may allay this disagreeable sensation, the horse is often picking his hay, but eats little or none; a degree of symptomatic heat comes on, and a consequent clamminess and thirst is perceptible. As the distemper advances, he becomes proportionally languid and inattentive; a swelling (with sometimes two or three small tumours surrounding it) is now discovered to have formed itself between the jaw-bones, which is at first very hard, exceedingly painful, and visibly increasing; he now swallows with difficulty, heaves in the flanks, and his whole appearance gives signs of the greatest distress. With regard to the prognostics, when the swelling begins on the inside of the jaw-bone, it shews it will be a long time before it grows ripe or imposthumate. When it rises between the jaw-bones in the middle under the tongue, it is a sign the disease will be mild, and of no dangerous consequence; when the skin that lies over the tumour is stiff, distended and tight, feeling hot and dry, a large swelling is portended, which will yield a plentiful discharge when it breaks. When it rises to the glands, and is, as it were, divided into knots, it is a sign that the disease will be long and tedious, because the tumours will break in several places, and at different times. When it lies at the head of the gullet or windpipe, the horse will not be able to swallow for several days, till the swelling descends more to the outward parts; but when he has a purulent running at the nose, it portends great danger, and shews it is complicated with some other disease which lies lurking in the blood; but if it goes off as the tumour ripens, the horse may do well. If the evacuations be regular (as they generally are), and the feverish symptoms moderate, let the swelling be examined, and its suppuration promoted. For this purpose (first clipping away all the long or superfluous hairs that cover or surround the part), foment with small double flannels, dipt in hot water, or a strong decoction of camomile flowers and marsh-mallow leaves, or rosemary, for ten minutes, as hot as can be conveniently submitted to; and then apply the emollient poultice, No. 52, or the turnip poultice, No. 53. Both the fomentation and the poultice must be repeated every night and morning till an opening in the swelling is effected, which generally happens in the course of five or six days. Upon the appearance of discharge, the aperture may be a little enlarged with a bistory or the point of any sharp

sharp instrument adequate to the purpose, though this will be unnecessary if the discharge is made freely and easy of itself. The part should then be dressed with the digestive ointment, No. 45, I, spread on tow; still continuing the poultice over it to promote the digestion, and prevent any remaining hardness. Some who are never easy unless they are doing something, will often open the swelling before it is ripe; not considering that this practice prevents the due discharge of the matter, which is always most plentiful when it comes to a head of its own accord, and will always be cleansed, and heal the sooner and better. When the tumour breaks of itself, some think it necessary to make the orifice wider, by putting in a sponge tent; but this is altogether superfluous, because there is always room for running off the matter, without any operation of that kind. However when the horse has fallen into bad hands, and improper applications have been used, so as to drive any part of the humour back, then enlarging the orifice may not be amiss. Bleeding, when this disease is genuine, is always unnecessary, and commonly dangerous; because it may recal the peccant matter expelled out of it: but when the disorder appears with uncommon symptoms, such as a swelling of the neck about the onset, stiff jaws, and the nostrils turned outward, which are signs of a dangerous inflammation; then we may venture upon taking away blood to stop its progress. When the swelling breaks inwardly, the horse's mouth should be kept sweet by washing it with some antiseptic fluid. White wine vinegar sweetened with honey, with the addition of a little brandy, will be sufficient for this purpose. In this disease mashes must be the constant food, in small proportions, to prevent waste: in each of which Mr. Taplin directs to put of liquorice and aniseed powders half an ounce, and about two oz. of honey, or in lieu of this last a quart of malt: the drink, consisting of warm water impregnated with a portion of scalded bran or water-gruel, should be given in small quantities and often. The head must be kept well covered with flannel, as the warmth will greatly tend to assist in promoting the necessary discharge: though, unless circumstances and weather forbid, the horse needs not be confined, but should have the advantage of air and short gentle exercise. Upon the whole this distemper is seldom dangerous, unless from neglect, ignorant treatment, or cruel usage. It generally terminates with a running at the nose, in a greater or less degree; which should be frequently cleansed from the inside of the nostrils, by means of a sponge sufficiently moistened in warm water, to prevent its acquiring an adhesion to those parts, or a foulness and fetor that would shortly become acrimonious. If a hardness remain after the sores are healed up, they may be anointed with mercurial ointment. If a copious and offensive discharge from the nostrils should continue after the abscess is healed up, there will be reason to suspect the disease called glanders, treated of in the preceding section.

The *IVES* or *VIVES* differ from the strangles only in this; that the swellings of the kernels seldom gather or come to matter, but by degrees perspire off and disperse by means of warm cloathing, anointing with the marshmallow ointment, a moderate bleeding, and a dose or two of physic. But should the inflammation continue notwithstanding these means, a suppuration must be promoted by the methods recommended for the strangles. When these swellings appear in an old or full-aged horse, they are signs of great malignity, and often of an inward decay, as well as forerunners of the glanders.

OF THE COLIC, OR GRIPES; AND PAINS IN THE BOWELS, FROM SUDDEN ACCIDENTS.

There seems to be no distemper so little understood by the farrier as the colic or gripes in horses, one general remedy or method serving them in all cases: but as this disorder may be produced by very different causes, the method of cure must also vary; otherwise the intended remedy, injudiciously applied, will not only aggravate the complaint, but make it fatal. We shall divide this disorder into three different species; the flatulent or windy; the bilious or inflammatory, and the dry gripes; each of which we shall distinguish by their different symptoms, and then point out the proper remedies.

I. THE FLATULENT OR WINDY COLIC may in general be readily distinguished by the rumbling of the confined air through the intestines: the horse is often lying down, and as suddenly rising again with a spring; he strikes his belly with his hinder feet,

stamps with his fore-feet, and refuses his meat; when the gripes are violent, he will have convulsive twitches, turn up his eyes, and stretch out his limbs as if dying, his ears and feet being alternately very hot and cold; he falls into profuse sweats, and then into cold damps; strives often to stale, and turns his head frequently to his flanks; he then falls down, rolls about, and often turns on his back; this last symptom proceeds from a stoppage of urine, that almost always attends this sort of colic, which may be increased by a load of dung pressing on the neck of the bladder. These are the general symptoms of colic and gripes from wind, drinking cold water when hot, and when the perspirable matter is retained, or thrown on the bowels by catching cold; in all which cases they are violently distended. Cribbing horses are more particularly subject to this complaint, as they are constantly sucking in great quantities of air. The first intention is to empty the bowels by the turpentine clyster, No. 23, or the laxative drink, No. 12. The hardened faeces, and the confined wind being discharged, and the neck of the bladder being eased, the suppression of urine is taken off, and the horse stales and gets ease.

II. The next species of COLIC is the *BILIOUS* or *INFLAMMATORY*. This, besides most of the preceding symptoms, is attended with a fever, great heat, panting and dryness of the mouth: the horse also generally throws out a little loose dung, with a hot scalding water; which when it appears blackish, or of a reddish colour, and fetid smell, denotes an approaching mortification. In this case the horse should immediately be bled to the quantity of three quarts; and it should be repeated, if the symptoms do not abate in a few hours. The turpentine clyster, No. 23, I, should be thrown up every two hours, till several loose stools are procured. The purging ball, No. 11, may be given first, and the clysters in four hours after, if relief be not obtained. As much linseed tea may also be given as the horse will drink, which will soften the acrimony of the ball, and tend greatly to assist the efficacy of the other remedies. If this disease be not removed by these means, but the inflammation and fever increase attended with a discharge of the flesh-coloured water above described, the event will most probably be fatal; and the chief thing to be depended on now must be a strong decoction of Jesuit's bark, given to the quantity of a pint every three hours, with a gill of red port wine.

III. THE SPASMODIC COLIC, or DRY GRIPES, as some call it, is always attended with costiveness, and the dung that comes away is black and hard; the urine is high-coloured, and the horse has a quick motion with his tail; his looks are dull, and his motions are sluggish. But the disease that is most dangerous, and which is often mistaken for the colic, is some inward inflammation, particularly of the guts, which is seldom found out till it is too late. As for the inflammation of the lungs, it may be known by the breath; and the inflammation of the liver by the symptoms of the jaundice or yellows. But an inflammation of any part of the guts has nothing particular to distinguish it from the dry gripes. This, for want of a timely assistance, generally terminates in a mortification; and then if any dung come away, it is black, which is a sign that the horse is past recovery. The way to prevent these fatal accidents, is always to be upon the watch when the horse has any symptoms of the gripes, and if he be costive, which is always the case in this inflammation, his body should be opened as soon as possible; not by purgatives which exasperate the disease, but by such things as will correct and discuss the offending humour, and carry it downward. Gentle emollient clysters and mild laxatives, either in the form of balls or drinks will by prudent repetition, in general, have a good effect. In the flatulent and spasmodic colic, after procuring a free evacuation by stool and urine, the carminative balls, No. 6, may be given with considerable advantage. When a horse has the symptoms of the gripes, with a looseness, and the dung has its natural colour, there is never any danger; but when it is blackish and stinking, the bowels are already mortified, and then all remedies will be given to no manner of purpose.

OF THE LAX AND SCOURING; WITH OTHER DISORDERS OF THE STOMACH AND BOWELS.

When the body of a horse is uncommonly open, and he dungs like a cow, or when he has a purging for a few days only, he is said to have a lax. But when it continues, he is said to have a scouring. This may proceed from various causes, as from a sudden

den stoppage of perspiration, from ravenous feeding, from hard riding or violent exercise, and then there is a discharge of slime or greasy matter; or from worms. Sometimes it is the consequence of other diseases, and sometimes it is a critical discharge of noxious humours. With regard to the prognostics, when it proceeds from a sudden stoppage of perspiration, commonly called a cold, it is never dangerous; nor when it is the effect of voracious feeding. The same may be said of that which succeeds hard labour. When scouring is habitual, it may go off as the horse advances in years, that is when he arrives at 7 or 8. That which succeeds or attends other diseases, cannot be judged of, without enquiring into the nature of the disease itself. Besides it may sometimes be critical, and then it will carry off the disease it accompanies. When a looseness is spontaneous, and comes on without any previous evident cause, it is critical, and generally tends to preserve health and prevent diseases. And when it is from worms, the only way to cure it is to remove the cause. It is sometimes very difficult to form a proper judgement when to controul or encourage a looseness; but these rules may be a general direction: if a healthy full horse, on taking cold, or upon hard-riding, over-feeding, eating unwholesome food, or with a slight fever, should have a moderate purging, by no means stop it, but rather encourage it with an open diet, and plenty of warm gruel: but if it continue long, with gripings, the mucus of the bowels coming away, and the horse losing his appetite and flesh, recourse must be had to proper medicines. The drink, No. 12, may be given three or four times, so as to encourage the evacuation of the offending matter, before the use of astringents: or half an ounce of rhubarb and two drachms of snake root, both in powder, may be given him in a horn or two of warm ale, every 24 hours or oftener, for three or four times. If he void great quantities of slime and greasy matter then add one scruple or half a drachm of ipecacuanha, and the same quantity of calomel to each dose, and make the whole into a ball with a little opiate confection; to be given once in 48 hours; or else, give one ball, No. 11, once in 48 hours, till this state of the fæces be altered. When by these means the stools become less offensive, and are no longer attended with griping or pain, but, by their frequency and consistence would continue to weaken the horse if not checked, astringents may be proper to complete the cure. A quart of the drink, No. 15, or one of the balls, No. 4 II, may be given two, three, or four times a day, according to the urgency of the complaint. If the griping and purging continue notwithstanding this treatment, and the discharge is attended with an acrid mucus or slime, and an evacuation of the common lining of the bowels, the starch clyster, No. 24, should be frequently injected warm.

The **Bloody Flux** is a distemper horses are not very subject to; however, as it sometimes does occur, whenever blood is discharged, attended with gripings and great pain in the bowels, if the flux is not speedily restrained, the horse probably may be soon lost: we recommend therefore the astringent clyster, No. 25, to be injected whenever the looseness is observed to be severe.

COSTIVENESS in horses is most frequent in hot weather, from an increased perspiration, from being kept to hard dry meat, or from want of air and exercise. Sometimes it becomes habitual, and then the horse never enjoys full health, but grows lean with a feverish heat and a staring coat. When the heat of the weather occasions this disorder, an opening diet with scalded bran will effect a cure, as well as in the other two cases; at most he needs have nothing more than from two to four oz. of Epsom salt, dissolved in water. But when it is become constitutional it is not so easily removed. It may happen, though very rarely, that a slow belly may be no disease, but rather a sign of strength and a good digestion and then we have nothing to do but prevent its increase, with now and then an opening diet. But when it produces the symptoms above-mentioned, we must have recourse to a constant opening diet, together with emollients. The best opener is scalded barley; and he should have the water it was scalded with to drink. All strong purges are as bad as poison, and therefore must be carefully avoided. The horse must have such laxatives only as to produce their effect without raising any commotion in the blood. Among these there is nothing more safe or certain than Epsom salt. Four ounces may be dissolved in a pint of water and given him for a dose; but this may be either increased or diminished according to its operation, and according as it is intended to purge either

more or less. Fenugreek seeds and linseed, on account of their oily mucilaginous quality, are very proper to render the guts slippery, and by that means to make his dunging regular. He should have an ounce every day mixed with his feed.

OF WORMS.

Zoologists and veterinary authors have described three different sorts of worms that affect horses; viz. Botts, which young horses are often troubled with in spring; the Rotundi, or those resembling earth worms; and Ascarides, or those about the size of the largest sewing needle, with flat heads. The symptoms of worms are various. The botts that many horses are troubled with, in the beginning of summer, are always seen sticking in the strait gut, and are often thrust out with the dung, with a yellowish coloured matter like melted sulphur; they are no way dangerous there; but are apt to make a horse restless and uneasy, and rub his breech against the posts. The season of their coming is usually in May and June; after which they are seldom to be seen, and rarely continue in any horse above a fortnight or three weeks. Those that take their lodgment in the stomach, are extremely dangerous by causing convulsions; and are seldom discovered by any previous signs before they come to life, when they throw a horse into violent agonies. The other kinds are more troublesome than dangerous: but are known by the following signs: the horse looks lean and jaded, his hair stairs as if he were surfeited, and nothing he eats makes him thrive; he often strikes his hind feet against his belly; is sometimes griped, but without the violent symptoms that attend a colic and strangury; for he never rolls and tumbles, but only shews uneasiness, and generally lies down quietly on his belly for a little while, and then gets up and falls a feeding; but the surest sign is when he voids them with his dung. For the cure of botts in the stomach, calomel should be given in large doses; viz. to the extent of two drachms made up in a ball with one oz. of aniseed powder, and a sufficient quantity of treacle. This to be put in over night and wrought off with a purging ball, No. 1 or 7, suited to the horse's strength and constitution; with the addition of one drachm of oil of savin. This may be repeated every six or eight days; and in the interval, let one of the vermifuge powders, No. 18, be given in his corn night and morning. Botts in the rectum may be cured by injecting the vermifuge clyster, No. 26, every morning, and using the powders above-mentioned. But as the source of worms in general proceeds from a vitiated appetite and a weak digestion, recourse must first be had to mercurials, and afterwards to such things as are proper to strengthen the stomach, promote the digestion, and by destroying the supposed ova, prevent the regeneration of these animals. For this purpose the tonic drink, No. 16, will be of considerable service.

OF APOPLEXY OR STAGGERS, LETHARGY, EPILEPSY, AND PALSY.

Farriers generally include all distempers of the head under two denominations, viz. staggers and convulsions, wherein they always suppose the head primarily affected. But in treating of these disorders, we will distinguish between those that are peculiar to the head, as having their source originally thence; and those that are only concomitants of some other disease.

In an **APOPLEXY** a horse drops down suddenly, without any other sense or motion than a working at his flanks. There are various degrees of this disease; for when the voluntary motions and animal functions, together with all sensation and consciousness cease, the animal will fall down as if struck with a thunderbolt. But sometimes, though the senses remain unhurt, the voluntary motions and animal functions cease; or at least the sense of feeling is either languid or quite abolished. The first case is called an apoplexy, and the 2d a palsy. The apoplexy has three degrees; the first takes away all sense and motion; the 2d the use of the will and all voluntary motions; the 3d is a slight degree of the 2d, and sometimes ends in a palsy. This may be caused by any thing that compresses the vessels of the brain; by too great a quantity of blood when the horse is fed plentifully, with little exercise; by being very much over-heated so as to expand the blood and render all the vessels turgid; by any fluid shed outwardly on the membranes of the brain, from blows on the head or falls; by blood or serum poured into the brain itself, and by its pressure hurting the origin

origin of the nerves, which is the most common cause of the apoplexy, and may be either blood or serum. This last most frequently happens to horses that have poor watery blood. The previous symptoms are, drowsiness; watery eyes, somewhat full and inflamed; a disposition to reel; feebleness; a bad appetite; the head almost constantly hanging, or resting on the manger; sometimes with little or no fever, and scarce any alteration in the dung or urine; the horse is sometimes disposed to rear up, and apt to fall back when handled about the head; which is often the case with young horses, to which it does not suddenly prove mortal, but with proper help they may sometimes recover. If the apoplexy proceed from wounds or blows on the head, or matter on the brain: besides the above symptoms, the horse will be frantic by fits, especially after his feeds, so as to start and fly at every thing. These cases seldom admit of a perfect recovery; and when horses fall down suddenly, and work violently at their flanks, without any ability to rise after a plentiful bleeding, they seldom recover. All that can be done is to empty the vessels as speedily as possible, by striking the veins in several parts at once, bleeding to four or five quarts: and to raise up the horse's head and shoulders, supporting them with plenty of straw. If he survive the fit, cut several rowels: give him night and morning clysters prepared with a strong decoction of senna and salt, or the purging clyster, No. 22; blow once a-day up his nostrils a drachm of asarabacca, or either of the powders, No. 19, which will promote a great discharge; afterwards two or three aloetic purges should be given; and to secure him from a relapse, by attenuating and thinning his blood, give him an ounce of equal parts of antimony, nitre, and gum-guaiacum every night. With regard to the other disorders of the head, such as lethargy or sleeping evil, epilepsy or falling-sickness, vertigo, frenzy, and madness, convulsions, and paralytical disorders, it may be observed, that most of them are to be treated as the apoplexy and epilepsy, by bleeding and evacuations, with the alteratives these directed.

In LETHARGIC DISORDERS, the horse generally rests his head with his mouth in the manger, and his poll often reclined to one side; he will shew an inclination to eat, but generally falls asleep with his food in his mouth, and he frequently swallows it whole without chewing: emollient clysters are extremely necessary in this case, with the antispasmodic balls recommended for apoplexy; strong purges are not requisite, nor bleeding in too large quantities, unless the horse be young and lusty.

OF THE YELLOWS, OR JAUNDICE.

Horses are often affected with this distemper: which is known by a dusky yellowness of the eyes; the inside of the mouth and lips, the tongue and bars of the roof of the mouth, looking also yellow. The horse is dull, and refuses all kinds of food; the fever is slow, yet both that and the yellowness increase together. The dung is often hard and dry, of a pale yellow or pale green. His urine is commonly of a dark dirty brown colour: and when it has settled some time on the pavement, it looks red like blood. He stales with some pain and difficulty: and if the distemper be not checked soon, grows delirious: which is a sign of an inflammation of the liver. The jaundice is either idiopathic or symptomatic; the seat of the first is in the liver, and the 2d may supervene to some other disease; or it may be critical when a fever is declining, and then the horse soon recovers his appetite, begins to look lively, the fever ceases, and the yellowness soon wears off. With regard to prognostics, when the horse is young and full of blood, the consequence of high feeding, and want of sufficient exercise, the cure will not be difficult. But if the disease succeed hard labour, which has hurt the liver by an abscess or otherwise, the cure will be exceeding difficult. When the liver is schirrous, which may be concluded by the swelling of the off side of the belly, about the region of the liver; the horse may linger a great while before it kills him, but he will grow weaker and weaker till he entirely becomes unfit for business. But if he retain his strength and vigour, without sickness or loss of appetite, there will be no danger of recovery by proper means. In the cure, we ought first to examine whether he has a fever, and the degree of it, that we may judge whether the liver be inflamed or not. If it be, we must begin with bleeding, and repeat it occasionally as long as the symptoms render it necessary, and as soon as possible rub the blistering ointment into the side all about the

region of the liver. These means alone will remove the inflammation, when they are administered in time. If any thing more be wanting, it must be laxative clysters to bring away the faeces, for this disease is always attended with costiveness. When the fever is gone off, if the jaundice still remain from the obstruction of the bilious duct, equal parts of aloes, rhubarb, and soap, $\frac{1}{2}$ oz. of each should be made into a ball and given every 3d or 4th day, washing it down with a pint of the deobstruent decoction, No. 17, when the materials can be procured.

OF THE DISORDERS OF THE KIDNEYS AND BLADDER.

The kidneys of a horse may be overstrained several ways; as by drawing too great a weight, by heavy burdens on the loins, and by not permitting him to stale on journeys. This last indeed is not properly a strain, but it has the effects of one, because all the vessels being turgid and over-loaded, they must of necessity be too much stretched, and their tone debilitated, which is the case in all strains. The same may happen if a horse be hard worked, when he is full of blood and humours; or he may receive blows on the loins or other hurts, which turning to an inflammation, may draw the kidneys into consent. When the horse has undergone any such hurts or hardships, the affection of the kidneys, may be discovered by a weakness of the back and loins, by difficulty of staling, by thick foul urine, sometimes bloody. These symptoms are attended with faintness, deadness of the eyes, and loss of appetite. But there is one sign very particular, and that is, he can seldom or never be backed without discovering signs of pain. The same thing will happen, when a horse has been wrenched in the back, but then there is no great alteration in the urine, except its being a little higher coloured than ordinary, nor does he lose his appetite or flesh. When the disease has continued a considerable time, it is attended with all the signs of a surfeit. When a fever attends a difficulty of staling, it is a sign of an inflammation of the kidneys. With regard to prognostics, diseases of the kidneys are never without danger, especially when they continue long, and the horse breaks out into scabs and blotches. An inflammation of the kidneys is very dangerous, unless taken in time. When a horse's urine is turbid, and yet comes away without much pain or straining, while the appetite is good and his eyes are brisk and lively, there is no danger: as also when he stales, and the thick sediment abates by degrees, till the urine comes to be of a natural colour. But when the urine is thick and ropy, and full of ulcerous matter or blood, attended with weakness and want of appetite; the case is dangerous. The consequences of a disordered state of the urinary organs are principally two; strangury and diabetes.

I. STRANGURY, or an obstruction of urine, may arise from different causes. When it is not owing to wind, or hardened dung pressing upon the neck of the bladder, it may proceed from inflammation in the bladder or kidneys, ulcerations there, or spasms upon any particular part. When owing to inflammation or spasm, the general indications of cure are, to lessen the stricture upon the parts; to reduce the inflammation; and to promote the evacuation of urine: the first of which intentions may be answered by a moderate loss of blood; the second, by the use of internal emollients; and the third, by gentle stimulants and mild diuretics. In strangury from inflammation or spasms in the parts, the horse makes frequent motions to stale, stands wide and straddling, appears full in the flank, and somewhat dejected. The first measure is bleeding, more or less plentifully according to the urgency of the symptoms. In a convenient time after this operation, inject the turpentine clyster, No. 23, II; or the diuretic drink, No. 13, II, may be given twice in the interval of three or four hours. Should neither of these, nor both in conjunction, procure an evacuation by urine, give the mild diuretic ball, No. 5, II, repeating it every four hours after the exhibition of the second dose, till relief be obtained by a plentiful evacuation. When the parts designed for the secretion of urine are cold and benumbed, the stimulant cataplasm, No. 54, or the blistering ointment, No. 47, I, may be laid to his loins. The former is a very penetrating composition, and may reach the cause of the complaint. It must be spread upon flannel, and bound on with another piece over that. It may be renewed once in two days, till the horse stales freely.

II. A DIABETES is a greater discharge of urine than the quantity of water that has been drunk. This generally proceeds from a laxity

a laxity of the kidneys. Horses subject to this disease, if old, or of a weak constitution, are seldom cured; they soon lose their flesh and appetite, grow feeble, their coat staring, and they die rotten. Of a young horse there are more hopes; but he must not be indulged with too much water, or moist food. The best medicines in this disease are those which strengthen the kidneys, without binding the belly. An ounce and an half of Peruvian bark, and half an ounce of alum made into a ball, with a little treacle, may be given night and morning, with a pint or two of a strong decoction of sassafras after each dose.

OF MOLTEN GREASE.

Molten grease is the voiding of greasy matter with the dung; which sometimes happens to very fat horses that stand much in the stable. Horses of hot constitutions which are apt to be costive, will sometimes void great quantities of slimy matter like corruption, and the balls of the dung will be covered with a pellicle, or thin skin. This is a common symptom which attends the retention of the dung. But neither of these can be referred to the melting of the grease, properly so called. Both these symptoms, however, are called by farriers molten grease. A fat horse may have his grease melted by hard usage, but seldom any other; and this must be done by hard riding, or working in very hot weather. It is always attended with a fever, heat, restlessness, starting and tremblings, great inward sickness, shortness of breath, and sometimes with the symptoms of a pleurisy. The horse's dung will be extremely greasy, and he will fall into a scouring. The horse soon looses his flesh and fat, which probably is dissolved and absorbed into the blood; and those that survive this shock commonly grow hide-bound for a time, their legs swelling both before and behind, and continue in this state till the blood and juices are rectified; and if this is not done effectually, the farcy, or some obstinate surfeit, generally follows; very difficult to remove. In the first place bleed plentifully, and repeat it for two or three days successively in smaller quantities, till the buff-coloured pellicle goes off the blood. He may also have a rowel in the breast: and when the working of the flanks begins to abate he may have another in the belly, and one on the inside of each thigh. Emollient clysters will be of great service to cool the intestines, such as have been already prescribed in other cases; taking care that no irritating ingredient enters therein. By the mouth give plenty of warm water or gruel, with cream of tartar or nitre, to dilute and attenuate the blood, which in this case is greatly disposed to run into grumes, and endanger a total stagnation.

OF HIDEBOUNDNESS, SURFEIT, AND MANGE.

I. The signs of hideboundness are, "a want of flexibility in the skin, which is pervaded by a general stiffness that seems to form an entire adhesion to the flesh, without the least partial separation, or distinction. There is a kind of dusty scurf, plainly perceived underneath the hair, that raises it up in different parts; and, giving it another hue, the coat in many places forms an appearance of two or three colours; conveying, even in this trifling circumstance, a very forcible idea of poverty in both food and raiment. The horse is generally languid, dull, heavy, and weak; his excrement is dark, foul, and offensive; he sweats much upon very moderate exertions; then his coat states, the hair turns different ways, its effluvium is disagreeable, and affords evident proof of weakness and debilitation. Bad food and want of care are, in general, the only probable reasons that can be assigned for this complaint. Long lank grass in low swampy land in autumn, and musty hay or bad oats at any season, may in some degree allay the hunger, but without strengthening the body; for, being in itself destitute of the quality and effect of superior food, no nutritive contribution can be conveyed for generating blood, or forming flesh. As to the cure, very few directions are necessary, the case being only a temporary inconvenience, rather than a disease. Therefore, to afford some little change to the circulation, take a very small quantity of blood; and in three or four hours after, increase its impetus by a mash of malt, oats, and bran, equal parts. Continue this mash every night for a fortnight, stirring in two ounces of flour of brimstone every other night; and for his other feeds (morning and noon) give equal parts of oats and bran, with half a pint of old beans in each, to prevent relaxing the body too much by the mashes. At the same time, regular and substantial dressing, air,

exercise, sound oats, sweet hay, and good soft water, will greatly contribute to promote the cure.

II. Of SURFEITS, according to Mr. Taplin, there are two kinds, originating from different causes: one being no more than a very advanced stage of the case last described; which being long neglected, all its symptoms increase, till the entire mass of blood being at last affected, the virulence of the disorder displays itself upon the surface of the body. The other kind of surfeit, differing from the former in cause, but very little in effect, is that, where, from ignorance or inattention, a horse is suffered to drink immoderately of cold water, when in violent perspiration, and the blood consequently in the highest degree of circulation. The circulating fluid being thus instantaneously checked by the influence of the frigid element, and the sudden contraction of the solids, the crassamentum becomes immediately thickened and inflamed; while the serum, separating from the other, extravasates itself; and, by an effort of nature, is propelled to the skin for transpiration, where the pores (having been instantly collapsed at the time of the water's taking effect) are so closely obstructed that its passage to the surface is rendered impracticable. In this situation it becomes united with the perspirable matter already confined there; and is, in the course of time, compelled by the progress of internal inflammation to make its way through the skin; upon which it at last appears in a variety of forms and different symptoms, assuming distinct degrees of malignancy, according to the state, habit, and constitution, of the horse at the time of attack. Such, in substance, is Mr. Taplin's account of this disorder. The indications of cure are, to resolve the inflammatory crudities, remove cutaneous obstruction, correct the acrimony of the blood, and gently quicken the circulation. The better to effect these, he directs to take away a moderate quantity of blood; to open the body with a few warm mashes; and according to the mildness or inveteracy of its appearance, to give either two or three mercurial purges, (No. 2,) avoiding cold during their administration. In three days after the last dose, a course of alteratives must be entered upon, or they may be given in the intervals of the purges. With each dose, one ounce of nitre may be given dissolved in a pail of water.

III. MANGE is a distemper so universally known as to render a particular description unnecessary. It proceeds chiefly from poor feeding: hence it is very little seen amongst horses of any estimation; but is almost entirely confined to the lower class of stables and proprietors. In a mangy horse the skin is generally tawny, thick, and full of wrinkles, especially about the mane, the loins, and tail; and the little hair that remains in those parts stands almost always straight out or bristly; the ears are commonly naked and without hair, the eye and eye-brows the same; and when it affects the limbs, it gives them the same aspect: yet the skin is not raw, nor peels off, as in the surfeit. Where this distemper is caught by infection, if taken in time it is very easily cured; and a sulphur ointment is recommended as most effectual for that purpose, rubbed in every day. To purify and cleanse the blood, give antimony and sulphur for some weeks after. There is a great variety of external remedies for this purpose, such as train oil and gunpowder, tobacco steeped in chamber ley, &c. most of them evidently improper. Soleseyl recommends burnt alum and borax in fine powder, of each two ounces white vitriol and verdegris powdered, of each four ounces; put them into a clean pot, with two pounds of honey, stirring till they are incorporated; when cold, add two ounces of strong aquafortis. But when this disorder, as is generally the case, is contracted by low feeding, and poverty of blood, the diet must be mended, and the horse properly indulged with hay and corn. With this view, there must be a constant supply of warm mashes, prepared with half malt and half bran, or equal parts of oats and bran, with four ounces of honey dissolved in each: let these be given night and morning, with a feed of dry corn every day at noon. During this treatment (which must be continued a week, to sheathe the acrimony of the fluids, and soften the rigidity of the skin) give one ounce of sulphur in each mash, and one ounce of nitre in water every night and morning. In a week or ten days, when the frame becomes more invigorated, discontinue the mashes, and let the diet be changed to good oats and sweet hay; giving, in the morning and evening feeds, the sulphur and antimony as before. In an incipient stage of the mange, the lotion, No. 27, will put an effectual stop to it, and being cleaner in its application than a greasy ointment, will be preferable in many cases. When every thing

else fails, equal parts of calomel and precipitated sulphur of antimony may be given from one drachm to two every morning, made into a bolus, with a little conserve of roses. When the horse is freed from his distemper, the place where he stood should be carefully cleaned, and washed with soap suds, as well as his clothing.

OF THE FARCY.

The **FARCY**, or **FARCIN**, has been mistaken by many for some one of the distempers already treated of; but is properly a distemper of the veins, and when inveterate thickens their coats so as to make them appear like so many cords. Their size always bears a proportion to the greatness or smallness of the vessels they affect. At first, one or more small swellings, or round buds, like grapes or berries, spring out over the veins, and are often exquisitely painful to the touch; in the beginning they are hard, but soon turn into soft blisters, which when broke discharge an oily or bloody ichor, and turn into very foul and ill-disposed ulcers. In some horses it appears on the head only; in some on the external jugular; in others on the plate vein, and runs downwards on the inside of the fore-arm towards the knee, and very often upwards towards the brisket: in some the farcy shews itself on the hind parts, about the pasterns, and along the large veins on the inside of the thigh, rising upwards into the groin, and towards the sheath; and sometimes it makes its appearance towards the flanks, and spreads by degrees towards the lower belly, where it often becomes very troublesome. As to the prognostics, when the farcy begins on those parts of the head where the muscular flesh is thin, and the veins small, it may be cured with ease. But when it attacks the loose parts, such as the kernels under the jaws, nostrils, and eyes, and continues so long as to creep to the neck vein, and render it corded, it is more difficult to manage. When it begins on any part, where the veins are small and kept in constant agitation by the motion of the horse, and always upon a stretch, such as the outside of the shoulder, and the outside of the hips, the disease can never take any deep root; because the action of these parts has a tendency to disperse obstructions. It is a great deal worse when it rises on the plate vein, swells and then turns corded, and the more when the glands or kernels, called the axillary glands, which lie under the arm-pit, become tumid with the anguish. The cure is still more difficult and tedious when the veins on the inside of the thigh are corded, especially when it rises upwards and affects the kernels of the groin, and the cavernous body of the yard. When the farcy begins on the pasterns, or lower limbs, it often becomes very uncertain, unless a timely stop is put to it; for the swellings in those dependent parts grow so excessively large in some constitutions, and the limbs so much disfigured thereby with foul sores and callous ulcerations, that such a horse is seldom fit for any thing afterwards but the meanest drudgery; but it is always a promising sign, wherever the farcy happens to be situated, if it spread no further. It is usual to affect only one side at a time; but when it passes over to the other, it shews great malignancy; when it arises on the spines, it is then for the most part dangerous; and is always more so to horses that are fat and full of blood, than to those that are in a more moderate case. This disease is at first of the inflammatory kind, therefore it will require plentiful bleeding, especially when the horse is fat and full of blood and humours. But this must be only in the beginning of the farcy, and while the disease continues in the inflammatory state, for afterwards when it is ulcerated it will do more harm than good. Likewise the bleeding must be moderate when the horse is low in flesh. Besides, his body must be kept open with the following cooling saline purge: Two ounces of Glauber's salts, one ounce of cream of tartar, and one ounce of nitre, dissolved in a quantity of water, given every day, or every other day, for a month. The sores at the very first must be anointed with the desiccative ointment, No. 44. The buds sometimes by this method are dispersed, leaving only little bald spots which the hair soon covers again; but to confirm the cure, and to disperse those little lumps which often remain for some time on the skin without hair, give crude antimony for a month; two ounces a-day for a fortnight, and then one ounce of the crocus for the largest dose per day for the other fortnight: by following this method, a farcy which affects only the small vessels may be stopped in a week or ten days, and soon after totally eradicated. When it appears in the thigh vein, it will cause a halting, or lameness, and then it will be soon discovered; as also by the swelling of the hock. In this case the liniment, No. 28, must

be applied to the vein as soon as possible. The alternate exhibition of the saline physic, and the antimonial medicines, must accompany this treatment. When there is a disposition in the blood, to a farcy, it may begin from the pricking of a sharp spur; it may likewise arise spontaneously about the spurred part without any pricking at all; and then the hair will stand up as a tuft all around the buds and blisters, and the matter that runs from thence will be purulent, and of a clammy, or greasy consistence. If this is not soon stopped, it will spread greatly. In this case use the liniment above prescribed, made with equal parts of the ingredients; and to prevent the swelling of the belly, apply the volatile liniment, No. 30, all over the affected side. The alterative balls, No. 9, 11, are proper in every stage of the farcy; and when the distemper is in its infancy, before the skin is much relaxed, will often cure it in a week or two, by giving them only once or twice a-day: but in an old farcy they should be given for two or three months together.

OF EXTERNAL AND LOCAL DISEASES.

OF DISEASES OF THE EYES.

In this very important part of farriery some considerable improvements have been practised of late at the Veterinary College. As the diseases of the eye, to which horses are so remarkably subject, are, in general, to be attributed to too great a derivation of blood to that organ, the experiment has been made in some cases, of taking up the carotid artery on the side of the affected eye. This has been attended with various success, yet sufficient to recommend it to the notice of every practitioner, who is desirous of improving the art of farriery in this very material respect. The cases that most frequently occur, requiring medical aid, or admitting of cure, are generally the effects either of cold, or of blows, bites, or other external injuries. In those proceeding immediately from cold, an inflammation is perceived from the globe of the eye, and internal surrounding parts, as the edge of the eye-lids, &c. Instead of its former transparency, the eye has a thick cloudy appearance upon its outer covering, and is constantly discharging an acrid serum, which in a short time almost excoriates the parts in its passage. The horse drops his ears, becomes dull and sluggish, is frequently shaking his head as if to shake off the tears, and in every action discovers pain and disquietude. In this case, after bleeding, the treatment prescribed for colds must be adopted and persevered in; and to cool the parts, and allay the irritation occasioned by the scalding serum, let the eyes and surrounding parts be gently washed twice or thrice every day with a sponge or tow impregnated with the collyrium, N° 29. If the inflammation should not seem likely to abate, but to wear a threatening appearance, one of the mild diuretic balls, N° 5, must be administered every morning, using gentle exercise with them. The effects arising from blows or bites form different appearances, according to the severity of the injury sustained. Should inflammation and swelling proceed from either cause, bleeding will be necessary without delay, and may be repeated at proper intervals till the symptoms appear to abate; and let the parts be plentifully embrocated four times a-day with the saturnine lotion, N° 31, diluted with six or eight times the quantity of water. If a large swelling, laceration, or wound, attend, after washing with the above, apply a warm poultice of bread, milk, and a little of the lotion, softened with a very small portion of lard or olive oil. In cases of less danger, or in remote situations where medicines are not easily procured, the following may be used as a substitute, viz. one of brandy, two of water, and four of vinegar. As to the gutta serena, cataract, film, &c. these are cases in which relief is very seldom obtained.

The **GUTTA SERENA** is a partial or universal loss of sight, where no palpable defect or fault appears in the eye, except that the pupil is more enlarged than in the natural state. The appearances of this blenheim are various, as well as the causes and effects, some of its subjects being totally blind, and others barely enabled to distinguish between light and darkness. The signs are a blackness of the pupil, an alteration of the size of the pupil, and its not contracting or dilating upon a sudden exposure to any degree of light. For the cure it is necessary to attend to the cause, and to apply such remedies as that may indicate: though, indeed, it is a disorder in which, from whatever cause originating, no great expectation can be formed from medicine either internally or externally.

A **CATARACT** is a defect in the crystalline humour of the eye, which

which, becoming opaque, prevents the admission of those rays upon the retina that constitute just and distinct vision. The disorder, called moon eyes, is only a cataract forming. It makes its appearance when a horse is rising at six, at which time one eye becomes clouded, the eye-lids being swelled, and very often shut up; and a thin water generally runs from the diseased eye down the cheek, so sharp as sometimes to excoriate the skin; the veins of the temple, under the eye, and along the nose, are turgid and full: though sometimes it happens that the eye runs but little. This disorder comes and goes till the cataract whitens; then all pain and running terminate, and the horse becomes totally blind, which is generally in about two years. During this time some horses have more frequent returns than others; which continue in some a week or more, in others three or four; returning once in two or three months, and they are seldom so long as five without a relapse.

There is another kind of MOON BLINDNESS, which is also the forerunner of cataracts, where no discharge of weeping attends. The eye is never shut up or closed, but now and then looks thick and troubled, at which time the horse sees nothing distinctly, it is not unusual in this case for one eye to escape. In all blemishes or defects, where a thickening of some one of the coats, membranes, or humours, of the eye, has formed an appearance of cataract or film, it has been an established custom among most farriers to bestow a plentiful application of corrosive powders, unguents, and solutions, for the purposes of obliteration; without reflecting (as Mr. Taplin observes) upon the absurdity of endeavouring to destroy by corrosion, what is absolutely separated from the surface by a variety of membranous coverings, according to the distinct seat of disease; with which it is impossible to bring the intended remedy into contact; without first destroying the intervening or surrounding parts by which the inner delicate structure is so numerously guarded. But in all disorders of this sort, whether moon eyes or confirmed cataracts with a weeping, general evacuations with internal alteratives can only take place. Indeed the attempts to cure cataracts have hitherto generally produced only a palliation of the symptoms, and sometimes have proved entirely destructive. Yet early care, it is said, has in some instances proved successful. To this end rowelling is prescribed, with bleeding at proper intervals, except where the eyes appear sunk and perishing. It is also directed, during the violence of the symptoms to observe a cooling treatment; giving the horse two ounces of nitre every day mixed into a ball with honey; and bathing the parts above the eye with verjuice or vinegar, wherein rose-leaves are infused, to four ounces of which half a drachm of sugar of lead may be added. The swelling on the lid may afterwards be bathed with a sponge dipt in equal parts of lime and Hungary water mixed together; and the cooling laxative drink, No. 12, should be given every fourth day, till the eye becomes clear. The haws are a swelling and sponginess that grows in the inner corner of the eye, so large sometimes as to cover a part of the eye. The operation here is easily performed by cutting part of it away; but the farriers are apt to cut away too much: the wound may be dressed with honey of roses; and if a fungus or spongy flesh arises, it should be sprinkled with burnt alum, or touched with blue vitriol.

OF STRAINS.

In all strains, it uniformly happens, that the muscular or tendinous fibres are overstretched; and sometimes ruptured or broke. To form, therefore, a true idea of these disorders, let us first consider every muscle and tendon as composed of springy elastic fibres, which have a proper power of their own to contract and extend themselves; or, to make their action more familiar, let us compare them to a piece of catgut, that we may the better judge with what propriety oily medicines are directed for their cure. Thus, then, if, by a violent extension of this catgut, you had so overstretched it as to destroy its springiness or elasticity, and were inclined to recover its lost tone, would you for that purpose think of soaking it in oil? And is not the method of treating strains, or overstretched muscles and tendons, full as preposterous, when you bathe or soak them in oily medicines, at a time that they want re-stringents to brace them up? Yet custom has so established this practice, and fallacious experience seemingly so confirmed it, that it would be a difficult task to convince the illiterate and prejudiced of the absurdity, who, by attributing effects to wrong causes,

are led into this error, and the oils usurp the reputation that is due only to rest and quiet: they seem, however, to be aware of the ill consequences by their adding the hot oils, as spike, turpentine, and origanum; which, though they in some measure guard against the too suppling quality of the other oils, yet the treatment is still too relaxing to be of real service. Indeed, in all violent strains of either tendons or muscles, whatever opinion we may entertain of bathing and anointing with favourite nostrums, which often succeed in slight cases, where perhaps bandages alone would have done; yet it is the latter, with properly resting the relaxed fibres, till they have thoroughly recovered their tone, that are the chief things to be depended on; and some months are often necessary for effecting the cure. All violent strains of the ligaments, which connect the bones together, especially those of the thigh, require time, and turning out to grass, to bring about a perfect recovery. External applications can avail but little, the parts affected lying too deep, and so surrounded with muscles that medicine cannot penetrate to them. The sooner, in these cases, a horse is turned out to grass, the better; as the gentle motion in the field will prevent the ligaments and synovia from thickening, and of course the joint itself from growing stiff. When a horse's shoulder is overstrained, he does not put out that leg as the other; but, to prevent pain, sets the sound foot hardly on the ground to save the other; even though he be turned short on the lame side, which motion tries him most of any. When trotted in hand, instead of putting his leg forward in a right line, he forms a circle with the lame leg; and when he stands in the stable, that leg is advanced before the other. To cure this lameness, the practice is first to bleed him, though perhaps this might as well be dispensed with; as in all cases where there are no positive inflammatory symptoms, bleeding only protracts the cure by weakening the system. Next let the whole shoulder be well bathed thrice a-day with hot verjuice or vinegar, in which are sal ammoniac, opodeldoc, No. 32, or two parts of camphorated spirits and one of oil of turpentine mixed. Soap dissolved in vinegar has been also prescribed; but this is impracticable as it will not dissolve in that or any other acid. When the strained part is very much swelled, it should be fomented with woollen cloths, large enough to cover the whole, wrung out of boiling water, and applied as hot as possible; a little brandy and vinegar, (equal parts of each,) being previously sprinkled upon them. They should be kept upon the part till they begin to cool, and then others should be applied as before. This must be repeated six or seven times. The last should be bound on with a dry one over it, to keep up a constant perspiration. Sometimes fomentations are made with a strong decoction of aromatic and emollient herbs: such as southernwood, wormwood, chamomile and elder flowers, mallows, &c. When the shoulder is much swelled, a rowel in the point of it often does great service; especially if the strain has been very violent, and the swelling very large: but as to boring up the shoulder with a hot iron, and afterwards inflating it, it is both a cruel and absurd treatment: and the pegging up the sound foot, or setting on a patten shoe, to bring the lame shoulder on a stretch, is a most preposterous practice, and directly calculated to render a horse incurably lame; for it can only be necessary in cases the very opposite to this, where the muscles have been long contracted, and we want to stretch them out. Where poultices can be applied, they are at first undoubtedly very effectual, after bathing with hot vinegar or verjuice; and are to be preferred greatly to cold charges, which, by drying so soon on the part, keep it stiff and uneasy: let them be prepared with oatmeal, rye-flour, or bran boiled up in vinegar, strong beer, or red wine lees, with lard enough to prevent their growing stiff; and when by these means the inflammation and swelling are brought down, bathe the part twice a-day with either of the above mixtures, opodeldoc, or camphorated spirit of wine; and roll the part three or four inches, both above and below, with a strong linen roller of about two fingers width; which contributes not a little to the recovery, by bracing up the relaxed tendon; and perhaps is more to be depended on than the applications themselves. In strains of the coffin joint, that have not been discovered in time, the cure will be extremely difficult. Strains of the back sinews are very common; and are easily discovered by the swelling, which extends sometimes from the back side of the knee down to the heel, but for the most part the horse sets that foot before the other. The tendon should be well bathed three or four times a-day with hot vinegar; and if much swelled, apply the poultices above recommended:

mended: and when the swelling is down, bathe with the mixtures above. Strains of the knees and pasterns arise frequently from kicks or blows: if they are much swelled, apply first the poultices; and when the swelling is abated, bathe with the embrocation, No. 34. As great weakness remains in the pasterns after violent strains, the best method is to turn the horse out to grass till he is perfectly recovered; when this cannot be complied with, the general way is to blister and fire. A lameness in the whirl bone and hip is discovered by the horse's dragging his leg after him, and dropping backward on his heel when he trots. If the muscles of the hip are only injured, this kind of lameness is cured easily; when the ligaments of the joint are affected, the cure is often very difficult, tedious, and uncertain. In either case, at first bathe the parts well with the cooling medicines, four or five times a-day: in the muscular strain, this method alone may succeed; but in the ligamentous, rest and time only can restore the injured parts to their proper tone.

OF TUMOURS AND IMPOSTHUMES.

Tumours or swellings, may arise either from external injuries or internal causes.

I. Tumours caused by external accidents, as blows and bruises, should at first be treated with restringents. Thus, let the part be bathed frequently with hot vinegar or verjuice; and, where it will admit of bandage, let a flannel wetted with the same be rolled on; if by this method the swelling does not subside, apply, especially on the legs, a poultice with red wine lees, strong beer grounds, and oatmeal, or with vinegar, oil, and oatmeal: either of these may be continued twice a day, after bathing, till the swelling abates; when, in order to disperse it entirely, the vinegar should be changed for camphorated spirit of wine, to four ounces of which may be added one of spirit of sal ammoniac; or it may be bathed with a mixture of two ounces of crude sal ammoniac boiled in a quart of chamber ley twice a-day, and rags dipped in the same may be rolled on. Fomentations are often of great service to thin the juices, and fit them for transpiration; especially if the injury has affected the joints. But in bruises, where the extravasated blood will not by these means be dispersed; the shortest way is to open the skin, and let out the coagulium. Critical tumours which terminate fevers, should by no means be dispersed; except when they fall on the pastern or coffin joint, so as to endanger them: in this case the discutient fomentation should be applied three or four times a-day, and a cloth or flannel, frequently wrung out of the same, should be bound on, to keep the joint in continued perspiration. But all tumours tending to certain maturation (from whatever cause they originated) should be expeditiously assisted by fomentation; and, after each time of using the fomentation, the ripening encouraged by suppurating poultices, wherever they can be applied; oatmeal boiled soft in milk, to which a proper quantity of oil and lard is added, may answer this purpose; or the emollient poultice, N° 52. These applications must be regularly continued till the matter is perceived to fluctuate under the fingers, when it ought to be let out: for which purpose let the tumour be opened with a knife or strong lancet, the whole length of the swelling, if it can be done safely; for nothing contributes so much to a kind healing as the matter having a free discharge, and the opening big enough to dress to the bottom. Pledgets of tow or lint spread with the digestive ointment, N° 45, II. and dipped in the same, melted with a fifth part of oil of turpentine, should be applied to the bottom of the sore, and filled up lightly with the same, without cramming: it may be thus dressed once or twice a-day, if the discharge is great, till a proper digestion is procured; when it should be changed for pledgets spread with the red precipitate ointment, N° 45, III. applied in the same manner. Should the sore not digest kindly, but run a thin water and look pale, foment, as often as you dress with the above fomentation; and apply over this dressing the strong beer poultice, and continue this method till the matter grows thick, and the sore florid. Wounds that look florid and fill up favourably while dressed with lint, will probably need no other application. If dressed too long with digestives, the flesh will rise fast, and if the sore is on a part where bandages cannot be applied, with compresses of linen cloth, these methods will be necessary to keep the granulations down, and to encourage the growth of the skin. The vulgar notion respecting proud flesh in healthy wounds, is a mischievous and vulgar error, which has led, both in the human and brute subject,

to an absurd and cruel practice, of employing escharotic and caustic dressings where they were not necessary. Writers on farriery have given in general very proper receipts to answer every intention of this kind by medicines; but as they have not laid down sufficient rules for their application in those cases where they are most wanted, the following general directions may be acceptable as the difficulty in healing some kinds of sores arises frequently from the unskilful manner of dressing them. We may then observe, once for all, that the cures of most sores are effected by the simplest methods; and that it is often of much more consequence to know how to dress a sore, than what to dress it with. In this indeed consists the chief art of this branch of surgery; for the most eminent in that profession have long ago discovered, that variety of ointments and salves is not necessary in the cure of most wounds and sores; and they have accordingly discarded the greatest part formerly in repute for that purpose; repeated observations having taught them, that, after the digestion, nature is generally disposed to heal up the wound fast enough herself; and that the surgeon's chief care is to prevent that luxuriance called proud flesh; which all ointments, wherein lard or oil enters, are apt to encourage, as they keep the fibres too lax and supple; and which dry lint alone, early applied, as easily prevents, by its absorbing quality, and light compression on the sprouting fibres. Thus, if a hollow wound or sore be crammed with tents, or the dressings be applied too hard, the tender shoots of flesh from the bottom are prevented from pushing up; and the sides of the sore by this distention may in time grow horny and fistulous; nor has the matter by this method a free discharge. On the other hand, if sores of any depth be dressed superficially, the external parts being more disposed to heal and come together than the internal, they will fall into contract, or heal too soon; and the sore, not filling up properly from the bottom, will break out afresh. Hence we may justly conceive how little stress is to be laid on famous ointments, or family salves, unskilfully applied; for unless this due medium be observed, or obtained in the dressing, no hollow sore can heal up properly. As soon then as a good digestion is procured, (which is known by the thickness and whiteness of the matter discharged, and the florid red colour at the bottom of the sore,) let the dressings be changed for the precipitate medicine; or the sore may be filled up with dry lint alone, or dipped in linewater, with a little honey and tincture of myrrh, or brandy, about a fifth part of the latter to one of the former: a pledget of lint dipped in this mixture, should also be applied to the bottom of the sore, which should be filled up with others to the surface or edges: but neither crammed in too hard, nor applied too loosely. By this method, the sore would heal up properly, and soft spongy flesh would be prevented or suppressed in time; whereas when ointments, or salves, are too long continued, a fungus, or proud flesh, is thereby so encouraged in its growth, that it requires some time to destroy and eat it down again; a proper compress of cloth, and a linen-roller, is absolutely necessary both for this purpose and to secure the dressings, wherever they can conveniently be applied. If any eschar of consequence should remain, and the hair not follow kindly, rub the part gently every night with a small quantity of camphorated spermaceti ointment, the best article known to promote the return of the hair upon the knees or any other part.

II. Tumours arising from INTERNAL CAUSES that require to be here noticed, are the scrofulous, encysted, and steatomatous.

1. SCROFULOUS TUMOURS are such as originate in scorbutic or hereditary taints, and increase or diminish according to the state or acrimony of the blood. For these the principal application is the strong mercurial ointment, No. 7, which must be assisted by a course of incercorial and antimonial alteratives.

2. ENCYSTED TUMOURS are such as originate in a cyst or bag, containing a kind of ichor, or gelatinous fluid; which being evacuated, the cyst does not always submit to digestives or escharotics, but must be extirpated with the knife, and cured as a common wound.

3. STEATOMATOUS TUMOURS, are those that form under the skin, on different parts, and pass under the denomination of WENS, though in fact they also are cysts: containing, when opened or extracted, a substance not unlike suet when hardly cold. Neither of the above are expected to submit to any topical application, unless upon the very first observation; when an attempt may be made by a small portion of the above mercurial ointment rubbed

in every night for a considerable length of time; but no radical cure can be in general obtained but by extirpation, which generally succeeds if well performed, and the wound be afterwards treated rationally. A seton is a good remedy for the cure of encysted tumours of considerable size. It should be passed quite through, from the highest to the lowest part, and suffered to remain till the sides of the cyst are united, after which it should be withdrawn.

OF WOUNDS.

As the blood therefore is the best balsam of Nature, and in cases of fresh wounds in a healthy system, is endowed with the vis medicatrix Naturæ, it becomes an important object in the veterinary art, to adopt the speediest and most effectual means of preventing any great loss of it, by the use of the best styptics, in cases where, from any sudden accident, a horse has been wounded in a large vein or artery, and in a situation where perhaps the aid of no surgeon or skilful farrier can be readily procured. On this subject a memoir was presented to the Royal Academy of Sciences by M. La Fosse, wherein he gives an account of the success he had met with, in stopping the bleedings of very considerable arteries in horses, by applying the powder of puff-balls, the arteries cicatrizing by this means only, without any succeeding hæmorrhage. In the dressing of wounds, sores, &c. the following general rules ought carefully to be attended to by every practitioner: 1. To remove all foreign bodies (if it can be done with safety), all lacerated or torn parts, whether of the flesh or of the hoof, &c. which, if left in the wound might possibly impede the cure. 2. All wounds should be carefully inspected at every dressing, observing attentively whether any alteration has been made on their surface, whether they be clean at the bottom, and free from any extraneous substance that may hinder or retard the cure. 3. Cramming wounds with hard tents, and syringing them frequently with spirituous tinctures, are extremely hurtful. The former increases the pain and inflammation, &c.; the latter produces a callus upon the internal surface of the wounds, which prevents their healing. 4. The dressing of wounds should lie smooth and easy upon the parts. 5. Over-tight ligatures or bandages should be carefully avoided.

In all FRESH WOUNDS made by cutting instruments, there is nothing more required, than to bring the lips of the wound into contact, by suture or bandage, provided the part will allow of it; for on wounds of the hips, or other prominent parts, and across some of the large muscles, the stitches are apt to burst on the horse's lying down and rising up in the stall. In such cases, the lips should not be brought close together: one stitch is sufficient for a wound two inches long; but in large wounds, they should be at an inch or more distance; and if the wound is deep in the muscles, care should be taken to pass the needles proportionably deep, otherwise the wound will not unite properly from the bottom. If the wound should bleed much from an artery divided, the first step should be to secure it, by passing a crooked needle underneath, and tying it up with a waxed thread: if the artery cannot be got at this way, apply a button of lint or tow to the mouth of the bleeding vessels dipped in a strong solution of blue vitriol, styptic water, oil of vitriol, or hot oil of turpentine, powdered vitriol, or colcothar, &c. and remember always to apply it close to the mouth of the bleeding vessels, and take care that it is kept there by a proper compress and bandage till an eschar is formed; otherwise it will elude your expectations, and frequently alarm you with fresh bleedings. In slighter bleedings we would recommend a pledget of lint dipt in oil, or rather lightly greased, to be laid over the wound; and above it a piece of sponge dipt either in melted wax, or strong glue, or mucilage of gum Arabic; and pressed till it hardens. This, secured with a firm bandage, will, in many cases, be effectual; for as the sponge dilates by heat or moisture, (according as it is prepared), the compression will not readily give way.

OF ULCERS IN GENERAL.

Simple ulcers, that are not attended with any particular obstacle to their healing in the general state of the system, require much the same treatment with wounds; but as all ulcers, difficult to heal, proceed from a particular indispotion of the blood and juices, before the former can be brought into any order, the latter must

be corrected by alteratives. The first intention in the cure of ulcers is to bring them to digest, or discharge a thick white matter; which will, generally, be effected by the ointment, No. 43, III. but should the sore not digest kindly by these means, but discharge a gleety thin matter, and look pale, we must then have recourse to warmer dressings, such as balsam, or oil of turpentine, melted down with common digestive, No. 45, I, and a strong beer poultice over them. It is proper also in these kinds of sores, where the circulation is languid, and the natural heat abated, to warm the part, and quicken the motion of the blood, by fomenting it well at the time of dressing. This will thicken the matter, and rouse the native heat of the part, and then the former dressings may be re-applied. If the lips of the ulcer grow hard or callous, foment strongly with a decoction of camomile and mallows, as hot as can be conveniently applied: then scarify superficially the whole part, both longitudinally and transversely with a fleam or abscess lancet, so as entirely to penetrate the callous substance upon the surface; after which it must be dressed with digestive ointment twice a day; the fomentation and scarifications to be repeated occasionally, till the callosity is quite sloughed off and comes away with the dressings. As soon as the callosity is removed, and the discharge comes to its proper consistence, dress in general with a small portion of lint thinly covered with either of the basilicons, placed under a pledget of tow spread with the simple digestive; or softened with oil of turpentine, where a copious discharge is required. Should the wound incarnate too fast, and fill with fungous flesh, treat it as directed for wounds.

OF A BONE SPAVIN.

This disorder is a bony excrescence, or hard swelling, growing on the inside of the hock of a horse's leg. A spavin, that begins on the lower part of the hock, is not so dangerous as that which puts out higher; between the two round processes of the leg bone; and a spavin near the edge is not so bad as that which is more inward toward the middle, as it does not so much affect the bending of the hock. A spavin that comes by a kick or blow, is at first no true spavin, but a bruise on the bone, or membrane which covers it; therefore not of that consequence as when it proceeds from a natural cause: and those that put out on colts and young horses, are not so bad as those that happen to horses in their full strength and maturity; but in very old horses they are generally incurable. The usual method of treating this disorder is by blisters and firing; without any regard to the situation, or cause whence it proceeds. Thus, if a fulness of the fore-part of the hock comes upon hard riding, or any other violence, which threatens a spavin: in that case, such coolers and repellers are proper as are recommended in strains and bruises. Those happening to colts and young horses are generally superficial, and require only the milder applications; for it is better to wear them down by degrees, than to remove them at once by severe means. A second application of the blistering ointment, will, in colts and young horses, make a perfect cure. But when the spavin has been of long standing, it will require to be renewed, perhaps five or six times: but after the second application, a greater distance of time must be allowed, otherwise it might leave a scar, or cause a baldness; to prevent which, once a fortnight or three weeks is often enough; and it may in this manner be continued six or seven times, without the least blemish, and will generally be attended with success. But the spavins that put out on older or full-aged horses are apt to be more obstinate, being seated more inward: and when they run among the sinuities of the joint, they are for the most part incurable. The best and safest method, is to apply the blistering ointment, No. 47, III, and continue it according to the directions for some months, if necessary; the horses in the intervals working moderately: the hardness will thus be dissolved by degrees, and wear away insensibly.

OF CURBS, JARDONS, AND RING BONES.

I. As a spavin rises among the bones on the fore-part of the hock, so a curb takes its origin from the junctures of the same bones, and rises on the hind part, forming a pretty large tumour over the back part of the hind leg, attended with stiffness, and sometimes with pain and lameness.

A CURB proceeds from the same causes that produce spavins; viz. hard riding, strains, blows, or kicks. The cure at first is generally easily enough effected by blistering, repeated two or three times.

times, or oftener. If it does not submit to this treatment, but grows excessively hard, the quickest and surest way is to fire with a thin iron, making a line down the middle from top to bottom, and drawing several lines pretty deep crosswise on each side like a feather; and then to apply a mild blistering plaster or ointment over it. This method will entirely remove it.

II. There is another swelling on the outside of the hock, which is called a **JARDON**. This commonly proceeds from blows and kicks of other horses; but frequently happens to manege horses, by setting them on their haunches: it is seldom attended with much lameness, unless it has been neglected; or some little process of the bone broke. It should first be treated with coolers and repellers; but if any swelling continues hard and insensible, the best way is to blister or fire; but the mild blisters alone generally succeed.

III. The **RING-BONE** is a hard swelling on the lower part of the pastern, which generally reaches half way round the fore-part thereof, and has its name from its resemblance to a ring. It often arises from strains, &c. and, when behind, from putting young horses too early upon their haunches; for in that attitude a horse throws his whole weight as much, if not more, upon his pasterns, than on his hocks. When it appears distinctly round the pastern, and does not run downwards towards the coronet, so as to affect the coffin-joint, it is easily cured: but if it takes its origin from some strain or defect in the joint originally, or if a callosity is found under the round ligament that covers that joint, the cure is generally dubious, and sometimes impracticable; as it is apt to turn to a quitter, and in the end to form an ulcer upon the hoof. The ring-bones that appear on colts and young horses, will often insensibly wear off themselves, without any application; but when the substance remains, no other remedy is necessary but blistering, unless when by long continuance it is grown to an obstinate hardness, and then it may require both blistering and firing.

OF SPLENTS.

A **SPLENT** is a hard excrescence that grows on the shank bone. They are of various shapes and sizes. Some horses are more subject to splents than others; but young horses are most liable to these infirmities, which often wear off and disappear of themselves. Few horses put out splents after they are seven or eight years old, unless they meet with blows or accidents. Splents that arise in the middle of the shank bone are nowise dangerous; but those that arise on the back part of it, when they grow large and press against the back sinew, always cause lameness or stiffness, by rubbing against it: the others, unless they are situated near the joints, seldom occasion lameness. As to the cure of splents, the best method is not to meddle with them, unless they are so large as to disfigure a horse, or so situated as to endanger his becoming lame. Splents in their infancy, and on their first appearance, should be well bathed with vinegar, or old verjuice; which, by strengthening the fibres, often put a stop to their growth; for the membrane covering the bone, and not the bone itself, is here thickened; and in some constitutions purging, and afterwards diuretic drinks, will be a great means to remove the humidity and moisture about the limbs, which often give rise to such excrescences.

OF THE POLL-EVIL; FISTULA AND BRUISES ON THE WITHERS; WARBLER, AND SIT-FASTS.

I. The **POLL-EVIL** is an abscess near the poll of a horse, formed in the sinuses between the poll-bone and the uppermost vertebra of the neck; which when it breaks spontaneously, or is opened, discharges great quantities of viscid matter, not unlike dirty glue. It generally proceeds from blows or strains, or hurts in drawing; or from a critical translation of matter in a fever. When the poll swells from a blow or bruise, it may be easily cured by fastening an ear-band to the collar, to prevent its pressing on the part, and bathing it two or three times a day with warm vinegar, and if there be an oozing through the skin it must be mixed with an equal quantity of spirit of wine. In this state the abscess may by these means be prevented. But when there is a heat in the part with inflammation, it will be proper to bleed, and then apply a poultice of bread and milk; or the discutient cataplasm, No. 55; either of which must be repeated once or twice a day till the itching is gone, and the swelling abated. This method with laxative physic may

prevent an abscess; but when it is formed, bleeding and purging are unnecessary, and it must be brought forward with the suppurating cataplasms, till it bursts of itself; and then the matter must be squeezed out gently once or twice, after which it may be laid open, keeping as much as possible according to the direction of the fibres of the muscles, without cutting the tendinous ligament, that runs along the neck under the mane. And therefore, if the matter is gathered on both sides, the best way will be to open it on both sides. This done, a leaden probe must be introduced as gently as possible, and by these means the orifice must be made so wide as to introduce the finger; or it may be better done with a short sponge tent, and a bit of dry sponge will do well enough for this use without any preparation. If the matter be white, and of a good consistence, it may be heated with turpentine, honey, and the tincture of myrrh. When proud flesh arises, strew a little red precipitate on it. If the matter flow in great quantities, resemble melted glue, and be of an oily consistence, it will require a second incision, especially if any cavities be discovered by the finger or probe; these should be opened by the knife, the orifices made depending, and the wound dressed with the common digestive of turpentine, honey, and tincture of myrrh; and, after digestion with the precipitate ointment, to inject a little of the detergent lotion, No. 36, made warm; and fill the wound up with tow moistened with the same; but it must lie very loose, lest it should hinder the growth of good flesh. Sometimes bathing it with this liquor alone will do, if it be filled with dry lint, and covered with tow to keep it from the air. In some cases once or twice a day may be necessary till the running decreases and the sore grows better. Then the sore should be bathed with spirit of wine alone, and it should be covered with tow dipt in vinegar and whites of eggs beat together, which will serve instead of a bandage. This should be covered with a piece of woollen cloth, with two loops of list round his ears, and it may be tied underneath by tape fastened thereto. The latest practice however in the cure of the poll-evil, and certainly the best, is that of passing a seton through the cavity, in such a way as to make a depending opening; and this will generally cure without any other remedy.

II. **BRUISES ON THE WITHERS** frequently imposthume, and for want of cure turn fistulous. They arise often from pinches of the saddle, and should be treated with repellers, as the lotions and embrocations, No. 37, 38. These will often prevent imposthumes; when the swelling is attended with heat, smarting, and little hot watery pimples, the saturnine liniment, No. 40, II, will be the best application. But when the swellings are critical, the consequence of a fever settled on this part, we must avoid the repelling method, and assist in bringing the swelling to matter, by suppurating poultices: experienced farriers advise, never to open these tumours till they break of themselves: for if they are opened before they are ripe, the whole sore will be spongy, and discharge a bloody ichor, which soon degenerates into a sordid ulcer.

III. **WARBLER** are small hard tumors under the saddle-part of the horse's back, occasioned by the heat of the saddle in travelling, or its uneasy situation. As soon as the saddle is taken off after a severe chase or hard journey, a good groom or hostler will be very minute in his examinations, to discover whether any injury has been sustained in this part or any other. He will instantly perceive, by the horse's wincing, whether there is any defect from which a warble may speedily ensue; if so upon the first appearance, or earliest discovery, bathe three or four times a day with the vegeto-mineral water. No. 35.

IV. A **SIT-FAST** proceeds generally from a warble, and is the horse's hide turned horny or callous. In some little time the hair comes off, and it bears the appearance of a foreign solid substance, fixed in the centre of what seems to be a superficial wound. For this simple and very trifling complaint, there is but one certain and expeditious cure, namely, extirpation; which may be performed with a common penknife. But the most ready and least painful method of taking it off is by just raising either edge, till it can be taken hold of with a pair of common pincers; when, by leaning them to any side, you have an immediate fulcrum, or lever, and separate it instantaneously without pain or inconvenience. After the extirpation, it may be treated as a simple superficial laceration, and may in general be healed by a frequent application of Friar's balsam, tincture of myrrh, or even with a little common brandy. Due care, however should always be taken to guard the

the cicatrix in its infancy, and prevent the buckle of the girth from coming into direct contact with the injured part, not only till the surface is sufficiently hardened to render a repetition unlikely, but upon all future occasions.

OF WIND-GALLS; AND OF BLOOD AND BOG SPAVINS.

I. A **WIND-GALL** is a flatulent swelling, which yields to the pressure of the finger, and recovers its shape on the removal thereof; the tumor is visible to the eye, and often seated on both sides of the back sinew, above the fetlocks, on the fore legs, but most frequently on the hind legs; though they are met with on various parts of the body, wherever membranes can be so separated, that a quantity of air and serosities may be included within their duplicatures. When wind-galls appear near the joints and tendons, they are generally caused by strains or bruises on the sinews, or the sheath that covers them; which, by being over-stretched, have some of their fibres ruptured; whence probably may ouze out that fluid which is commonly found with the included air: though, where these swellings shew themselves in the interstices of large muscles, which appear blown up like bladders, air alone is the chief fluid; and these may safely be opened, and treated as a common wound. On the first appearance of wind-galls, their cure should be attempted by restringents and bandages; for which purpose, let the swelling be bathed twice a-day with vinegar, or verjuice alone; or with the repellent embrocation, No. 37; or let the part be fomented with the restringent fomentation, No. 56; binding over it, with a roller, a woollen cloth soaked in the same. Some, for this purpose, use red wine lees; others curriers' shavings wetted with the same, or vinegar, bracing the part up with a firm bandage. If, after a proper trial, this method should not succeed, authors have advised the swelling to be pierced with an awl, or opened with a knife; but mild blistering is in general preferred to these methods; the included fluids being thereby drawn off, the impacted air dispersed, and the tumour gradually diminished.

II. A **BLOOD-SPAVIN** is a swelling and dilatation of the vein that runs along the inside of the hock, forming a little soft swelling in the hollow part, and is often attended with a weakness and lameness of the hock. The treatment is the same as that above recommended.

III. A **BOG SPAVIN** is an encysted tumour on the inside of the hough; or, according to Dr. Bracken, a collection of brownish gelatinous matter, contained in a bag or cyst, which he thinks to be the lubricating matter of the joint altered, the common membrane that incloses it forming the cyst. This case he has taken pains to illustrate in a young colt of his own, where he says, When the spavin was pressed hard on the inside of the hough, there was a small tumour on the outside, which convinced him the fluid was on the inside of the joint. He accordingly cut into it; discharged a large quantity of this gelatinous matter; dressed the sore with dossils dipped in oil of turpentine; putting into it, once in three or four days, a powder made of calcined vitriol, alum, and bole. By this method of dressing, the bag sloughed off, and came away, and the cure was successfully completed without any visible scar. If, through the pain attending the operation or dressings, the joint should swell and inflame, foment it twice a-day, and apply a poultice over the dressings till it is reduced.

OF MALLENDERS AND SALLENDERS.

I. **MALLENDERS** are cracks in the bend of the horse's knee, that discharge a sharp indigested matter; they are often the occasion of lameness, stiffness, and the horse's tumbling.

II. **SALLENDERS** are the same distemper, situated on the bending of the hough, and occasion a lameness behind. Both these disorders are cured by washing the parts with a lather of soap warmed, or old chamber ley; and then applying over the cracks a strong mercurial ointment spread on tow, with which they should be dressed night and morning, till all the scabs fall off; if this should not succeed, anoint them night and morning with a little of the ointment of nitrated quick-silver; No. 48; to one oz. of which two drachms of the extract of lead is added; or else with an ointment of corrosive sublimate, in the proportion of one drachm to one oz. of lard. It may be mixed with the lard by itself, after being rubbed into fine powder; or it may be previously dissolved in a little marine acid.

OF LAMPAS, BARBS, WOLVES TEETH, AND OTHER DISEASES OF THE MOUTH.

I. The **LAMPAS** is an excrescence in the roof of the horse's mouth, which is sometimes so luxuriant, that it grows above the teeth, and hinders his feeding. The ordinary method of cure is lightly cauterising the flesh with a hot iron, taking care that it does not penetrate too deep so as to scale off the thin bone that lies under the upper bars; the part may be anointed with burnt alum and honey, which is proper for most sores in the mouth. This operation is by some justly thought to be quite unnecessary; it being a general observation, that all young horses have their mouths more or less full of what are called lampas; and that sometimes they rise higher than the fore teeth. It is further observed, in proportion as a horse grows older, the roof flattens of itself, and the teeth then appear to rise. We are obliged to the ingenious M. La Fosse for this remark, which we hope will produce an abolition of this barbarous and useless operation.

II. **BARBS** are small excrescences under the tongue, which may be discovered by drawing it aside, and are cured by cutting close off, and washing with brandy, or salt and water.

III. A horse is said to have **WOLVES TEETH**, when the teeth grow in such a manner, that their points prick or wound either the tongue or gums in eating. Old horses are most liable to this infirmity, and whose upper overshoot the under teeth in a great degree. The remedy is to file down the superfluous parts of the teeth till they be sufficiently wasted.

IV. Besides these disorders of the mouth, there are often observed on the inside of the lips and palate, little swellings or bladders, called giggs. Slitting them open with a knife or lancet, and washing them afterwards with salt and vinegar, is in general their cure; but when they degenerate into what are called cankers, which are known by little white specks, that spread and occasion irregular ulcers, the best method then is to touch them daily with a small flat cautery, moderately heated till the spreading is stopped, and to rub the sores three or four times a-day with mel. *Ægyptiacum*, and tincture of myrrh; or borax and honey of roses. When by this dressing the sloughs are separated, they may be washed frequently with a sponge dipped in a strong solution of blue vitriol and alum.

V. A **RELAXATION AND SWELLING OF THE PALATE**, sometimes happens to horses on catching cold. To remedy this disorder anoint the part with honey of roses, acidulated with marine acid; or bathe it with the restringent fomentation, No. 56, cold, either applied with a sponge, or thrown into the mouth with a syringe.

OF THE GREASE.

The **GREASE** is a disease, of the nature and causes of which authors have given a very imperfect account. The name is probably derived from the discharge thrown out from the skin of the part affected, which is of a greasy or unctuous nature. The part in which it always begins is the fetlock of one of the hind legs. It scarcely ever is seen in the fore leg; and the reason why it affects the hind leg exclusively, is probably its greater distance from the centre of the circulation, the vessels acting more and more weakly in proportion to their greater distance from the heart. From this circumstance, it seems to be a disease primarily arising from local debility, and from an inert state of the circulating vessels. When a horse becomes affected with the grease, several transverse chaps or fissures take place at different distances above the heels. When these exist, they are greatly aggravated by the motions of the horse, which are continually varying; so that if there existed in these fissures a disposition to unite, it would still be counteracted by the parts being repeatedly put on the stretch, and the union, if any had taken place, would be forcibly torn asunder. Veterinarian authors have usually considered this disease as arising from two different causes: 1st, a fault or relaxation in the vessels; or 2dly, a bad disposition in the blood and juices. They observe, that the blood is brought to the extreme parts by the arteries, and returned by the veins; in which latter, the blood is to rise in perpendicular columns, to return the circulating fluids from the extremities; hence swellings in the legs of horses may easily be accounted for, from an inadequate motion of the venous blood in the finer vessels, where the circulation is most languid; and especially

cially when there is want of due exercise, and a proper muscular compression on the vessels; in short, they represent, that the blood in such cases cannot so readily ascend as descend, or a greater quantity is brought by the arteries than can be returned by the veins. The grease then, considered in this light, must be treated as a local complaint, where the parts affected are alone concerned, and the constitution actually takes no part; or as a disorder where they are both complicated; but when it is an attendant on some other distemper, as the farcy, jaundice, dropsy, &c. such diseases must first be cured before the grease can be removed. In the former case, moderate exercise, proper dressing, cleanliness, and external applications, will answer the purpose: in the latter, internal medicines must be employed. When a horse's heels are first observed to swell in the stable, and subside or go down on exercise, let care be taken to wash them very clean every time he comes in, with soap suds, chamberley, or vinegar and water; which, with proper rubbing, will frequently prevent or remove this complaint: or let them be well bathed twice a-day with old verjuice, or the vegeto-mineral water, which will brace up the relaxed vessels; and if rags dipped in the same are rolled on, with a proper bandage, for a few days, it is most likely the swellings will soon be removed by this method only, as the bandage will support the vessels till they have recovered their tone. To answer this end also, a laced stocking made of strong canvas or coarse cloth, neatly fitted to the part, would be found of great use. But if cracks or scratches are observed, which ooze and run, let the hair be clipped away, to prevent a lodgement which may become offensive, and to give room for washing out dirt or gravel, which, if suffered to remain, would greatly aggravate the disorder. When this is the case, or the heels are full of hard scabs, it is necessary to begin the cure with poultices, made either of boiled turnips, with a handful of linseed powdered; or oat-meal and rye-flour, with a little common turpentine, boiled up with strong beer grounds, or red wine lees. The digestive ointment being applied to the sores for two or three days, with either of these poultices over it, will by softening them promote a discharge, unload the vessels, and take down the swelling; when they may be dressed with the ointments recommended for the mallenders; particularly with the first of them. In obstinate cases, if the horse be full and fleshy, the cure must be begun by bleeding, rowelling, and purging; after which diuretics are frequently given with success. The legs should also be fomented twice a-day with the discutient fomentation, No. 38, in which a handful of wood ashes has been boiled. If the sores be very foul, they must be anointed with equal parts of oil of turpentine, tincture of myrrh, and *Ægyptiacum*; or two parts of burnt alum, and one of red precipitate rubbed to a fine powder and sprinkled over them previous to the dressing.

OF RUPTURES, AND COLT EVIL, OR GONORRHOEA.

I. Though ruptures are generally divided into particular classes, we shall only observe, that by violent efforts of the horse, or other accidents, the intestine or omentum, or a portion of each, may be forced between the muscles of the belly at the navel, or through the rings of the muscles into the scrotum. These swellings are generally about the size of a man's fist, sometimes much larger, descending to the very hock; they are frequently soft, and yield to the pressure of the hand, when they will return into the cavity of the belly with a rumbling noise: and, in most, the aperture may be felt through which they passed. Every method should be tried on their first appearance, to return them by the hand; but if the swelling should be hard and painful, in order to relieve the stricture, and relax the parts through which the gut or caul has passed, let a large quantity of blood be immediately taken away, and the part fomented twice or thrice a-day, applying over it a poultice of oat-meal and vinegar, which should be continued till the inflammation subsides, and the gut can be returned. In the mean time, throw up emollient oily clysters twice a-day, and let the horse's chief diet be boiled barley, with scalded malt, or bran. Should the swelling afterwards return, the restraining applications, usually recommended on these occasions, will avail nothing without a suspensory bandage; so that an ingenious mechanic in that art is chiefly to be relied on for any farther assistance. It has nevertheless been observed, that with moderate feeding, and gentle exercise, some horses have continued to be very useful under this complaint.

II. The *Colt Evil* is supposed to arise from stoned colts attempting to copulate with mares before they are able: whence frequently ensues an excoriation or fretting on the glands, and a swelling on the sheath. This last disorder frequently proceeds too from dirt or filth lodging there, and is often removed by washing the part clean with butter and beer: but when the yard itself is swelled, foment it twice a-day with a decoction of marshmallows. Dress the excoriation with simple ointment, or wash it with a sponge dipped in lime water, to a pint of which may be added two drachms of sugar of lead. The penis should be tied up to the belly; and if the swelling should increase with the inflammation, bleed, give some cooling physic, and apply a poultice of bread and linseed meal made with Goulard's water, No. 35. If a simple gonorrhoea, or seminal gleet, flows from the yard, (which is often the case in high fed young horses, where relaxation has been brought on by frequent emissions,) let the horse be plunged every day into a river or pond; give him two or three doses of rhubarb, at proper intervals; and afterwards some balls prepared with rhubarb and turpentine; two drachms of the former to half an ounce of the latter. They should be given every night till the complaint goes off.

OF WOUNDS IN THE FEET.

Wounds in the feet happen frequently; and we may add chiefly from inattention or neglect; and from injudicious treatment, they often become serious. The most approved and rational method of treating recent wounds is, to endeavour to bring them to a supuration, or discharge of laudable matter; for which purpose, poultices are most eligible, as they may be easily made more or less of a digestive quality, by melting and mixing any proper digestive ointment, with the poultice whilst warm. Many people are indeed prejudiced against the use of poultices, from a notion, that they (as the phrase is) draw humours to the wounded part; but the absurdity of this way of reasoning will be evident to those who are in the least acquainted with the healing art. Poultices may be continued till the wound appears to be well digested, by a kindly supuration of white well concocted matter, and looks smooth and equal, free from cavities or excrescences of proud flesh; in that case, the use of poultices may be left off, and the surface of the wound may be sprinkled over with a mild escharotic, prepared by mixing one ounce of Armenian bole, with three ounces of quick-lime, that has fallen to powder by exposure to the air, and then passing them together through a fine sieve. After the wound is sprinkled with this powder, a pledget of dry lint may be fixed gently over it; and when the surface of the wound is nearly equal with the skin, the powder will be sufficient, without any cloth or covering. There is a species of wounds to which the feet are much exposed, called punctures, on account of their small orifice, as the parts immediately after the wound is inflicted readily close up, whereby it becomes difficult to know the depth of the wound. They are generally occasioned by treading upon sharp stones, or bones, broken glass, nails, &c. and likewise by nails in shoeing; any of which perforating the sole or frog, may wound the internal parts of the foot. These from their situation and confinement within the hoof, are attended with the most violent pain and inflammation, which are frequently increased by the injudicious method generally observed in treating these wounds when first inflicted; viz. by pouring hot corrosive oils into the recent wound, to deaden it (as the phrase is,) which is productive of the worst of consequences. Punctures from nails in shoeing, are commonly said to proceed from ignorance or blundering. This may frequently be the case; but, at the same time, it is an accident that may, and indeed does, happen to the most expert artist; and it is surprising, considering the narrow space there is in some hoofs for driving nails, that it does not happen oftener. When discovered in time, it is easily cured, by opening a passage for the matter downwards, and dressing it with any digestive ointment or poultice, and keeping the foot moist, by applying an emollient poultice all round the hoof. But when it is overlooked, or a fragment of the nail remains in the wound, the inflammation increasing, it at last suppurates. The matter accumulating, and not finding a passage downwards, from the natural formation of the hoof, it moves upwards to the coronet or top of the hoof, and forms a round tumour, which afterwards breaks out, and degenerates into a most malignant ulcer, commonly termed a quitter. This tumour is usually attended with great pain and inflammation,

and a considerable swelling round its basis. The method of cure commonly practised, and recommended by authors, is the actual cautery, or some very active caustic. Punctures differ little or nothing, in the manner of treating them, from wounds; only the sole or frog should be scraped thin all round the orifice of the wound, which, at the same time, if too small, should be enlarged, and an emollient poultice applied, taking care that no fragment of extraneous substance remain in the wound, and keeping the whole hoof moist and soft with similar poultices around it; and, in cases attended with violent pain, recourse must be had to such remedies as are proper in inflammatory cases; particularly moderate doses of nitre, given as before directed. Contusions or bruises happen frequently on the coronet or top of the hoof, from the treading of other horses feet, which will occasion lameness; although at the same time no external mark of violence will appear on the coronet farther than a little swelling; but the horse will shew a sense of pain when the affected part is touched or pressed upon. The discutient poultice, No. 55, may be applied with success, if continued for some time.

OF FOUNDERED FEET.

The term *foundered* is frequently applied to lame horses in a very vague manner, and without any determined or fixed meaning; for, when a horse shews any defect or impediment in moving his fore feet, he is then pronounced to be *foundered*, whether he really has been so or not; that is, according to what is commonly understood by that term, owing to the want or neglect of not making proper distinctions of the different diseases in the feet. If we consult authors who have treated upon this subject, we shall find their accounts of it very dark and imperfect; they bewilder the reader, and convey but a very indistinct idea of the nature of the disease: hence many errors are committed in practice, to the destruction of a number of valuable horses, which otherwise, by proper management, might have been rendered sound and useful. When a horse is first attacked with the disorder, he shews a great restlessness, is hot and feverish, heaves much at the flanks, breathes quick, has a quick strong pulse, and groans much when moved about; at the same time, he shews symptoms of the most violent pain, sometimes in one, but more frequently in both fore feet; for which reason, he lies down much; but, when forced to move forwards, he draws himself together, as it were into a heap, by bringing forward his hind feet almost under his shoulders, in order to keep the weight of his body as much as possible from resting upon his fore feet. It is almost universally allowed, that the cause of this disease proceeds from too violent exercise, such as riding very hard upon stony grounds or turnpike roads, and that young horses are most liable to it; and to these we may likewise add, unequal pressure upon the internal parts of the foot, from the concave or hollow form of the common shoes. All these causes combined together, when a horse is of a plethoric or full habit of body, and not accustomed to violent exercise, occasion this disease in a greater or less degree. To form some faint idea of this malady in horses, we may in a great measure appeal to what we experience ourselves in running upon hard ground; for we find, that it occasions a great heat, attended with a smart pain in our feet, which would be greatly increased from uneasy shoes, especially if compelled, like horses, to continue the running for any considerable time. The feet likewise become turgid and painful after a long day's journey, especially if the person is not accustomed to travel; and this inflammation frequently terminates in blisters upon the soles of the feet. Hence it is evident, that, in proportion to the habit of body the horse is in at the time, and the violence of the labour or exercise he has undergone, the inflammation in the internal parts of the foot will be more or less violent; and besides being attended with all the symptoms of fever in general, particular local symptoms will indicate the seat of the disease to a certainty. In stepping forward he draws his leg backward, before setting his foot to the ground, setting down his heel with great caution, on which he rests most, the toe being turned a little upwards, as if afraid of touching the ground. From this symptom only, we may judge with certainty, even though at a distance, upon seeing a horse walk, whether he has ever been *foundered* or not. The hoofs at the same time are exceedingly hot; and if water is thrown upon them, they dry instantly: if any attempt is made to pull off any of the shoes, the horse shews great uneasiness upon the least twist or pressure made upon any part of the foot,

and a great unwillingness to support the weight of his body upon the other foot, especially when they are both alike affected. Since the circulation is greatly increased, and the current of blood chiefly determined towards the fore feet, attended with symptoms of the most violent pain, we may thence conclude, that there is an inflammation in these parts; therefore, the cure must first be attempted by diminishing the circulation of the blood, by topical bleedings in some of the veins of the leg; by giving cooling saline purges; clysters, an opening diet, and plenty of diluting liquor four or five times a-day, together with emollient poultices applied warm all round the hoofs, to soften them, and keep up a free and equal perspiration; observing, that his shoes be easy upon his feet, but by no means to pare the sole or frog to that excess which is commonly done in cases of this kind, farther than cleaning away the hardened surface of the sole and frog, in order that the poultice may have the desired effect, by increasing the perspiration through the pores; and to avoid all manner of greasy or oily applications to the hoofs, for the reasons already given.

OF HOOF-BOUNDNESS.

This complaint affects the hoofs differently, according to their natural shape, and the treatment they are exposed to, whether it be injudicious shoeing, keeping the hoofs too hot and dry, or paring the sole and binders at every time they are shod. Some are affected with a circular contraction of the crust, compressing the whole foot. In others the crust is contracted at the coronet only, compressing the annular ligament, &c. A third species is, when either one or both heels are contracted; hence, therefore, in proportion to the degree of contraction, the internal parts of the foot are compressed, and the horse becomes more or less lame. As to any method of cure, all that can be said is, that, as this disease is one of that kind which comes on gradually, yet perceptibly, it may by proper care and management, when early attended to, be prevented. But when it once becomes confirmed, it never will admit of a thorough cure. It may be so far palliated, however as to render a horse in some degree sounder, by keeping the hoofs cool and moist; as, in this case, they are apt to be very hot, dry, and hard, his shoes should be flat, narrow, and open heeled; the hoofs never greased nor oiled; the soles never pared. When it is considered how much the elastic power of the heels depends on the bars, which act as a spring between them and the frog, it must appear unreasonable that they should be shaved away, as is too often done by farriers, under the idea of preventing corns; though by such a process corns are created. A good open heel is the indication of a powerful foot. But as the crusts of the heels in these hoofs are preternaturally high and strong, they should always be pared down till they are lower than the frog, that if possible it may rest upon the ground.

OF CORNS.

In the human body, corns in the feet, are properly so termed, from their horny substance; but what are called corns in the feet of horses are very improperly named, as they are quite of an opposite nature, rather resembling contusions, not unlike those bruises which happen in the palms of the hands and fingers to working people, where the skin is thick, and appears of a blackish red colour; being exceedingly painful at first, and containing blood, but in the end the serum being absorbed, the red particles appear when the dead skin is removed, like red powder. In like manner corns, or rather bruises, appear red and foxy, as the phrase is. They are situated in the sharp angle of the sole at the extremity of the heels, where the crust reflects inward and forward, forming the binders. But they are more frequently met with in the inside heel, from the manner of the horse's standing, together with the pressure or weight of the body, which is greater upon the inside of the hoof than the outside. Bruises of this kind are exceedingly painful, inasmuch that the horse shrinks and stumbles when any thing touches or presses upon that quarter of the hoof; hence lameness. This complaint arises from different causes, according to the natural formation of the hoofs, together with the treatment they are exposed to. For the cure cut away as far as the extravasation, and apply a pledget of lint, dipped in tincture of myrrh, or in balsam of Peru. When the corn has been cut, the horse should be turned out to grass, without shoes if practicable; or, if his labour cannot be dispensed with, let a chambered shoe

shoe be put on; so as to avoid pressing the part. Corns or bruises in the feet of horses might, by taking proper care of them, be easily avoided; for in those countries where the horses go mostly barefooted, this malady is not known; neither are horses that go constantly at cart and plough subject to it. Hence it is oftenest to be met with in great towns, where horses go much upon hard causeway, having their shoes turned up with high caulkers on the heels, and frequently renewed; their hoofs at the same time being kept too dry and hard, from standing too much upon hot dry litter. Hence there is an evident necessity of coolness and moisture, together with using such a form of shoe as will press equally upon the circumference of the crust, without giving it any unnatural shape.

OF THE RUNNING THRUSH AND CANKER.

I. A **RUNNING THRUSH**, or **FRUSE**, is a discharge of ichorous matter, from the cleft in the middle of the frog, affecting one, often two, and in some cases all the four feet. But, generally, the fore-feet are most subject to this disease. In most cases, it seldom admits of a radical cure; but is subject to frequent relapses, occasioning lameness, from the rawness and tenderness of the parts affected on being exposed to sand, gravel, &c. or in rough ground, from the heels treading on sharp stones, &c. and when the horse happens to be in a bad habit of body, they degenerate into what is commonly called a canker. As to the cure, in most cases where the disease has been of long standing, affecting all the frogs more or less, it is impracticable to eradicate it by any assistance from art. But in those hoofs which are wide and open at the heels, where the complaint is recent, one or both of the fore feet only being affected, and where there is reason to suspect that it proceeds from the use of hollow shoes, or keeping the hoofs too hot, dry, and hard, the cure may be completed with ease and safety, by laying aside the use of concave shoes, washing the frogs clean after exercise, and dressing them with *mel Ægyptiacum*, or a solution of blue vitriol, in the proportion of one ounce to a quart of water, keeping the hoofs cool and moist. At the same time, recourse must be had to internal remedies by way of revulsion, or diuretic medicines, bleeding being first premised: if the former is made choice of, twice or thrice will be sufficient, repeated at proper intervals; but if the latter, which seems preferable, they may be continued for some time with great safety, without losing one day's work of the horse.

II. In horses of a bad habit of body, especially the heavy draught kind, running thrushes sometimes degenerate into what is called a canker. In this case the horny substance of the frog is soon thrown off; the fleshy parts grow to an immoderate size, the luxuriant substance or spongy flesh having a great number of papillæ or tubercles, which Mr. Gibson compares, not improperly, to cauliflower, the colour only excepted, which is of a pale red, sometimes variegated with blood; attended with a copious discharge of a thin ichorous fetid humour, having a most offensive smell. If its progress be not speedily stopped, the fleshy sole, from its vicinity becomes likewise affected; the horny sole rots, decays, and falls off; the whole foot turns into a kind of bog, in warm weather full of maggots, which it is almost impossible to prevent, even with the most corrosive dressings; the tendons become likewise affected, the bones carious, the hoof falls off, and the horse is rendered useless. To prevent these consequences, as soon as a running thrush begins to shew the least malignant disposition, proper means must be used to correct the habit of body, and to divert this discharge to some other outlet, either by purging or diuretic remedies, continued for some time, bleeding being first used. As to external applications, the first thing necessary to be done, is to pare down the crust till it is lower than the fungus, or growth of the canker, and to remove any hard pieces of the hoof or sole wherever it presses upon the tender parts; the circular part of the crust should be kept soft with an emollient poultice. For dressings the mildest escharotic powders may be first tried; as a mixture of blue vitriol and burnt alum, one part of the former to two of the latter. But when it degenerates into a canker, the strongest corrosive applications will be necessary, and sometimes hardly sufficient to keep down the luxuriance of the fungus. The concentrated mineral acids are preferable, or butter of antimony: either of these may be applied once every day; otherwise, if neglected dressing too long, or to every other day, which is the common practice, the great humidity and moisture issuing from

the fungus so weakens the force of the strongest oils, that they have little or no effect. When these sharp dressings seem to gain upon the canker, it may be dressed with equal parts of red precipitate and burnt alum pounded and mixed together, till the new sole begins to grow; the purging or diuretic medicines being given at proper intervals till the cure is completed.

OF FALSE QUARTERS AND SANDCRACKS.

I. A false quarter in the foot of a horse is a cleft or chink in the side or quarter of the hoof, running in a slanting direction with the horny fibres of the hoof, from the coronet to its basis, by which the horny substance of the crust is divided; one part of the hoof being in a manner detached from the other, and rendered unable to sustain its share of the weight of the limb, &c. and hence the name of false quarter: for, when the horse sets his foot on the ground, the chink widens: but, when it is lifted up, the hardened edges of the divided hoof take in between them the soft parts, and squeeze them so as to occasion frequent bleeding at the chink. This is often attended with inflammation, a discharge of matter, and of course lameness. Horses with this defect should be carefully observed; and when the thick hardened edges of the chink grow too high, by which it is so much the deeper, and, of course, lodges the greater quantity of sand, &c. these edges should be rasped, or pared with a crooked knife, till the seam disappears. But wherever there remains a blackness, or appearance of gravel, that must be traced farther; always observing, if possible, to avoid drawing blood.

II. A **SAND-CRACK** a perpendicular fissure extending more or less from above downwards, or from below upwards, but in all instances penetrating to the sensible parts, and thus causing lameness when the animal puts himself in motion. Where this happens there is a preternatural brittleness and dryness of the hoof, which should be counteracted, either by turning the horse out upon wet ground, or by applying moist poultices to his feet when in the stable. To cure this disease, the sides of the crack must be pared through its whole length, and the transverse incision also made; after which the reproduction of the hoof from the coronet must be watched, and when favourable, it must be secured from splitting in consequence of motion communicated from the old crack, by another transverse cut or incision in the crust.

A COLLECTION OF MEDICINES.

The following prescriptions are accommodated to the diseases of the horse, and the cases in which they may be applied are easily known by the references to the numbers prefixed.

BALLS.

Balls and pastes are the most convenient form for the exhibition of such medicines as require the dose to be ascertained with exactness; as opiates, cathartics, mercurials, &c. And likewise for disguising the taste of those that are nauseous, as the fetid gums, &c. As balls dissolve more slowly in the stomach, they are capable of producing more gradual and lasting effects, than any of the other forms; which, in most cases, is a considerable advantage, where the medicine is not required to exert its influence immediately; otherwise a drink is preferable. Balls should be of an oval shape, and not exceeding the size of a pullet's egg. When the dose is larger, it should be divided into two; and they should be dipped in oil to make them slip down the more easily. The following is the most accurate formulæ for making them up, according to the most improved modern practice, in the different diseases for which they are prescribed.

NO. 1. PURGING BALLS.

I. Take socotorine aloes six ounces, Castile soap and vitriolated tartar, three ounces each; jalap and ginger, two ounces each; oil of aniseeds, one ounce; syrup of buckthorn, enough to make a mass. The socotorine aloes should always be preferable to the Barbadoes or plantation aloes, though the latter may be given to robust strong horses; but even then should always be well divided by some neutral purging salt, as vitriolated tartar, or the cream of tartar; but with this ingredient soap should not be admitted into the compound, as all acids decompose it. Any of these additions, by destroying the tenacity of the aloes, prevents its adhesion to the coats of the stomach and bowels, from whence horrid gripings, and even death itself, have often ensued. This caution is well worthy of being attended to, as many horses have fallen sacrifices to the neglect of it. See **ALOES**. The above mass may be divided

vided into from four to eight doses, according to the age, strength, and constitution, of the horse; or the ingredients may be separately proportioned to the like circumstances, for a single dose.

II. Take Socotorine aloes, six ounces; gum guaiacum powdered, half an ounce; diaphoretic antimony and powder of myrrh, each two drachms; syrup of buckthorn, sufficient to make a ball. These balls will seldom take a horse from business above two or three days in a week: nor will he lose his appetite or flesh by using them, but will rather be improved in both. These advantages cannot be obtained by any other method of purging, and hence this is preferable in most cases.

No. 2. MERCURIAL PURGING BALL.

This ball is made by adding one-half or three drachms of calomel, to a dose of the above purging ball, No. 1; observing that this addition will allow a proportional diminution of the other ingredients, and being careful to adjust them to the strength of the subject, and the degree of evacuation required.

No. 3. FEBRIFUGE BALLS.

I. Take contrayerva root and snake root, half an ounce each; myrrh, two drachms; camphor, one drachm; opiate confection, three drachms; honey sufficient to make a ball. In slow fevers, attended with irregular symptoms, and especially in those of the putrid kind, this ball should be given twice or thrice a-day, washing it down with about one pint of red port, and as much vinegar mixed together. One drachm of camphor, and as much castor, may be added to this ball as occasion requires.

II. Take Peruvian bark, one ounce; snake-root and winter's bark, half an ounce each; honey, sufficient to make a ball. To be given in the decline of fevers, and in those of the intermittent kind, every six hours, till the horse's recovery is pretty well established, as the danger of a relapse will thus be prevented, and the cure sooner completed.

No. 4. ASTRINGENT BALLS.

I. Take prepared chalk, one ounce; tormentil and gum arabic, three drachms each; cassia two drachms; conserve of roses, as much as will make a ball; to which may be added, as occasion requires, twelve or twenty grains of opium. When a purge does not set in the usual time, and the horse is much depressed by the continuance of its operation, this ball may be given with the opium, and repeated every six or eight hours till the purging be stopped.

II. Take catechu, kino, and cassia, each two drachms; chalk prepared, two ounces; mucilage of gum Arabic, enough to form a ball.

No. 5. DIURETIC BALLS.

I. Take nitre, one ounce and a half; Castile soap, one ounce; filings of iron in fine powder, half an ounce; squills in powder, two drachms; honey or treacle as much as will make a ball.

Mild Diuretic Balls.

II. Take jalap, six drachms; vitriolated tartar and nitre, one ounce each; soap, two ounces; oils of aniseed and juniper, each one drachm: mix.

III. Take of Castile soap and nitre, one ounce and a half each; camphor, two drachms; oil of juniper, one drachm and a half; aniseed powder, two ounces; treacle, enough to make a mass: divide into two balls, one to be given six hours after the other.

No. 6. CARMINATIVE BALLS.

I. Take bay berries, cummin seeds, and caraway seeds, each four ounces; ginger and long pepper, each two ounces; essential oils of peppermint and pennyroyal, each one drachm; treacle, enough to make a mass. Of this mass three or four ounces may be given with advantage in the windy colic, after emptying the bowels with a clyster, or the laxative drink, No. 12. If relief be not obtained upon repeating this twice or thrice within a few hours, then give the following:—

II. Take of the above mass, three ounces; asafoetida, half an ounce; oil of amber and tincture of opium, each one ounce and a half; and make a ball with treacle or common syrup.

No. 7. STOMACHIC LAXATIVE BALL.

Take socotorine aloes, six drachms; rhubarb powdered, three drachms; myrrh, two drachms: make into a ball with syrup of ginger.

No. 8. DEOBSTRUENT BALL.

Take Castile soap, eight ounces; Indian rhubarb, two ounces;

long pepper, one ounce; syrup or honey, sufficient to make a mass: divide into ten balls.

No. 9. ALTERNATIVE BALLS.

I. Take quicksilver, one drachm; rub it, till it be perfectly extinguished, with two drachms of manna, softened with a little mucilage of gum Arabic: then add levigated antimony and rust of iron prepared, one ounce each, with as much honey as will make a ball. In obstinate chronic jaundice, this ball given once a-day till the mouth becomes affected, and the horse begins to slaver, will be of considerable service, and may be had recourse to when there is reason to suspect a schirrous liver.

II. Take precipitate sulphur of antimony and calomel, each one ounce; gum guaiacum in powder, four ounces; aniseed powder, six ounces; honey and mucilage of gum Arabic, equal parts of each, sufficient to make a mass: to be divided into twelve balls.

No. 10. DETERGENT DEOBSTRUENT BALLS.

Take precipitated sulphur of antimony, two ounces; garlic, four ounces; orris root and elecampane, three ounces each; gum ammoniac, myrrh, and asafoetida, two ounces each; honey and balsam of sulphur, each as much as will make a mass: to be divided into eighteen balls. One to be given every morning for asthmatic cough and broken wind. In many cases they will afford considerable relief.

No. 11. CAMPHORATED PURGING BALL.

Take calomel, opium, and camphor, each one drachm; jalap half an ounce; scammony, one ounce and a half; soap, one ounce; syrup, as much as to form a ball.

DRINKS.

As horses more willingly take sweet and palatable things than those that are bitter and of an ill taste, care should be taken that the latter be given in balls, and that their drinks be always contrived to be as little nauseous as possible, and sweetened either with honey or liquorice. Those that are prepared with grass powders are by no means so agreeable to a horse as those made by infusion; as the former often clam the mouth, irritate the membranes about the palate and throat, and frequently occasion the cough they are intended to prevent.

No. 12. LAXATIVE DRINK.

Take senna, two ounces; coriander seeds bruised, one ounce and a half; ginger, two drachms: infuse in one pint and a half of boiled water till cold: strain the infusion and dissolve in it three ounces of cream of tartar, and one ounce of salt of tartar; and then add four ounces of syrup of buckthorn. The cream of tartar, in the proportion set down in this drink, forms a neutral salt, called soluble tartar, which it is not necessary to have ready made, when it is intended to be given in a dissolved state. Instead of this, four ounces of Glauber's or Epsom salt may be used at the discretion of the prescriber. In all inflammatory disorders this drink may be given with the utmost safety, and is greatly preferable in such cases, to all other purges, as it passes into the blood, and operates also by urine. It may be repeated as circumstances require, and its effects assisted by opening clysters, or its operation quickened by the addition of another ounce of senna, or two drachms of jalap.

No. 13. DIURETIC CORDIAL DRINK.

I. Take juniper berries bruised, four ounces; caraway seeds and aniseed, one ounce each; lintseed, two ounces; boiling water in sufficient quantity to strain off two pints; to which add spirit of nitre and camphorated spirit of wine, one ounce each. This drink, given in two portions in the course of an hour, will be of considerable service in procuring an evacuation by urine, when the horse seems to be griped in consequence of a purge that does not operate freely, but makes him swell and refuse his meat and water. It is also very proper in the flatulent colic.

Mild Diuretic Drink.

II. Take salt of tartar, half an ounce; distilled vinegar, as much as may be necessary to make a neutral mixture; spirit of nitre, two ounces; strong infusion of juniper berries and lintseed, one pint. Mix.

No. 14. COOLING FEBRIFUGE DRINK.

Take of baum and sage, each a handful; liquorice root sliced, half an ounce; salt prunel or nitre, three ounces. Infuse in two quarts of boiling water; when cold, strain off, and squeeze into it the

the juice of two or three lemons, or add half a pint of vinegar. As the ingredient chiefly to be depended on in this drink is the nitre, it may perhaps be as well given in water alone; but as a horse's stomach is easily palled, and he requires palatable medicines, the other ingredients may be useful in this respect.

No. 15. ASTRINGENT DRINK.

Take logwood, half a pound; pomegranate peel, four ounces; cassia, half an ounce; lintseed, two ounces. Boil in three quarts of water to two, and strain off. Where it can be afforded, half a pint of port wine may be added to each dose.

No. 16. STRENGTHENING DRINK.

Take gentian, calamus, and orange-peel, two ounces each; chalybeate or smithy water made boiling hot, two quarts: infuse till cold; then strain, and add equal quantities of lime-water fresh made, one pint, or one and a half, to be given once or twice a-day for some weeks.

No. 17. DEOBSTRUENT DECOCTION.

Take parsley root, madder, and turmeric, four ounces each; burdock root, half a pound; liquorice root, two ounces; boil in a gallon of smithy or forge water to three quarts.

POWDERS.

Powders are a form of medicine not well adapted for internal use, in any other way than in a mash or corn; and for the reason assigned in the preceding section, every thing of a disagreeable flavour, whether in smell or taste, should be rejected, when the medicine is to be given in this form.

No. 18. VERMIFUGE POWDERS.

Take Æthiops mineral, and powdered tin, four ounces each; prepared steel and India pink in powder, each two ounces. Mix, and divide into twelve doses.

No. 19. STERNUTATORY POWDERS.

I. Take white hellebore, three ounces, lavender, betony, and marjoram, each one ounce. Mix.

II. Take turbith mineral, one drachm; powdered betony, or marjoram, two ounces. Mix. These powders are given with success in cases of apoplexy or staggers.

No. 20. ALTERNATIVE POWDER.

I. Take gum guaiacum, four ounces; levigated antimony, eight ounces; sulphur, six ounces. Mix, and divide into sixteen doses; one to be given at night and morning.

CLYSTERS.

CLYSTERS are differently denominated, according to the qualities of the ingredients composing them. There are many cases in which they may be administered with great success.

No. 21. LAXATIVE CLYSTER.

Take two or three quarts of thin water-gruel; Glauber's salts, or common salt, eight ounces; salad oil, six ounces.

No. 22. PURGING CLYSTER.

Take two quarts of gruel; coarse sugar, six ounces; Glauber's salts, four ounces; tincture of jalap, two ounces; and half a pint of olive oil. To be repeated every twenty-four hours, or oftener, if necessary.

No. 23. TURPENTINE CLYSTERS.

I. Take Venice turpentine, two ounces: dissolve it in the yolks of eggs, and add opiate confection, two ounces; Epsom salt, four ounces; thin gruel, two pints. Mix.

Diuretic Clysters.

II. Take two or three pints of thin gruel; dissolve it in one and a half ounce nitre; then add three ounces of Venice turpentine previously incorporated with the yolks of two eggs; and likewise half a pint of lintseed oil. When a clyster is designed to promote urine, this is very well calculated for the purpose, and should be thrown up moderately warm.

No. 24. STARCH CLYSTER.

Take thin starch, or tripe liquor, two quarts; oil of olives, half a pint; the yolks of six eggs well broken, and two or three ounces of coarse sugar. Mix the oil by degrees with the yolks of the eggs, and then gradually add the starch or tripe liquor, in which the sugar has been previously dissolved.

No. 25. ASTRINGENT CLYSTERS.

Take oak bark, four ounces; tormentil root, two ounces; burnt

harts-horn, three ounces. Boil in three quarts of smithy water to two; strain off, and add four ounces of starch, previously softened with a little warm water, towards the end of the boiling; and in the strained liquor while warm dissolve half a drachm of opium.

No. 26. VERMIFUGE CLYSTER.

In a pint of very strong decoction of two parts of common wormwood and one of rue, dissolve half an ounce of aloes, and add one pint of lime-water, and half a pint of lintseed oil. Let the whole be well incorporated and administered for a dose, in case of worms.

LINIMENTS, EMBROCATIONS, and LOTIONS.

A LINIMENT differs from an embrocation or lotion, by having some unctuous ingredients in its composition; though this distinction is not uniformly regarded. It differs from an ointment by being of a much thinner consistence.

No. 27. LOTION FOR THE MANGE.

Take corrosive sublimate, one ounce; common salt, three ounces; boiling water, one gallon, tobacco liquor, half a gallon. Mix.

No. 28. STYPTIC BALSAM, or LINIMENT FOR THE FARCY.

I. Take oil of turpentine, three ounces. Put it into a pint bottle, and drop into it two ounces of oil of vitriol; adding the latter gradually, to prevent a great and sudden effervescence, which might burst the bottle. To avoid this, let the first small quantity that is dropt in, (which must not exceed a tea spoonful at once,) have done smoking, before dropping in any more. When the farcy affects the larger blood-vessels, after bleeding, the parts must be first rubbed with a woollen cloth, and this liniment must then be applied over the buds and swellings twice a-day. It abates the acrimony of the humours, prevents the rising of fungous flesh, and makes the sores run. But when the disease lies loose in the fleshy parts, there must be equal quantities of the oils of vitriol and turpentine. This method may be continued a fortnight, or till the sores run plentifully and begin to dry; and till the lips and edges are no way thick and callous. Then mix equal parts of ointment of elder and honey, to promote the growth of the hair; or dress them with Turner's cerate, or any other soft ointment. This treatment must be accompanied with the internal use of alteratives. The alternative powder, No. 20, is the best for this purpose.

II. Take salad oil, three ounces, spermaceti, six drachms: bees-wax, four drachms: Melt them over a gentle fire, and stir them till quite cold.

No. 29. COOLING COLLYRIUM.

Take sugar of lead, one drachm; white vitriol, two scruples; camphorated spirit, one ounce; water, eight ounces. Mix.

No. 30. VOLATILE LINIMENT.

Take neat's foot oil, two ounces; strong spirit of sal ammoniac, and one ounce and a half tincture of cantharides, half an ounce. Mix. This is an useful application in various topical inflammations, especially where there is a tendency to suppuration.

No. 31. SATURNINE LOTION.

I. Take extract of lead, two ounces; camphorated spirit, eight ounces; distilled vinegar, one pint. Mix.

II. Take extract of lead, one ounce; distilled vinegar, seven ounces; water, eight ounces. Mix. In recent bruises, strains, and swellings occasioned by external accidents, the part affected may be bathed frequently with this lotion; and where it will admit of bandage, let a double or triple fold of flannel be wetted with it, and rolled on.

No. 32. SOAP LINIMENT, or OPODELDOC.

Take Castile or white soap, four ounces; camphor, two ounces. Dissolve the soap in a pint of proof spirit, and the camphor in as much rectified spirit: Then mix the two solutions, and add half an ounce of essential oil of rosemary. Opodeldoc is often successfully used against strains, bruises, &c. but its efficacy is increased by the addition of the ingredients which form the anodyne balsam. See No. 33.

No. 33. ANODYNE BALSAM.

Take crude opium, one ounce; vinous spirit of sal ammoniac, (or spirit of wine and spirit of sal ammoniac equal parts of each mixed,) half a pound; soap liniment, one pound and a half. Digest the opium in the vinous spirit of sal ammoniac till it be dissolved: then add the solution to the soap liniment, and strain the whole

whole for use. This is a very penetrating embrocation, and is highly useful in allaying pain and swelling, by relaxing the irritated fibres, and promoting the perspiration of the obstructed matter; speedily restoring the affected part to its former state. It should be plentifully applied and diligently rubbed in, that its efficacy may be properly excited to produce the desired effect.

No. 34. DISCUTIENT EMBROCATION.

I. Take opodeldoc, four ounces; spirit of sal ammoniac, one ounce. Mix.

No. 35. VEGETO-MINERAL WATER.

I. Take extract of lead, one ounce; camphorated spirit, two ounces; spring water, one quart. Mix.

Goulard's vegetable-mineral water.

II. Take extract of lead and camphorated spirit, one ounce each; distilled vinegar, two ounces; spring water, one pint and a half. Mix.

No. 36. DETERGENT LOTIONS.

I. Take rectified spirit of wine and white wine vinegar, each half a pint; white vitriol, half an ounce. Dissolve the vitriol in the vinegar; and add tincture of myrrh, four ounces. Mix these together, and shake the bottle before using.

II. Take white vitriol and sugar of lead, three ounces each; tincture of myrrh, one ounce; spring water, half a pint. Mix.

No. 37. REPELLENT EMBROCATIONS.

I. Take extract of lead, and camphorated spirit, two ounces each; vinegar, one pint. Mix.

II. Take Mindererus's spirit and camphorated spirit, each four ounces. Mix.

No. 38. REPELLENT LOTIONS.

I. Take white vitriol and alum, one ounce each; vitriolic acid, half an ounce; vinegar, one pint. Mix.

II. Take crude sal ammoniac, three drachms; distilled vinegar, four ounces; French brandy, two ounces. Mix.

No. 39. EXTRACT OF LEAD.

Boil one pound of litharge in two quarts of vinegar, to one quart. Set it aside till it settle; and then decant what is clear for use.

No. 40. SATURNINE LINIMENTS.

I. Take camphor rubbed to powder with a little spirit of wine, half an ounce. Dissolve it in half a pint of green oil, and add half an ounce of extract of lead.

II. Take extract of lead one ounce; olive oil three ounces. Add the oil gradually to the extract, and rub them well together in a marble mortar, till the whole be mixed. Two drachms of camphor rubbed to powder, with spirit of wine, may be added to this. This is the most proper liniment that can be used for the grease, cracked heels, and similar complaints. After having washed the parts perfectly clean with a strong lather of soap, and dried them well, if they are very foul, they should, before using the liniment, be gently bathed with tincture of myrrh, and when that is dried in, the liniment is to be rubbed over the whole.

TINCTURES.

No. 41. TINCTURE OF MYRRH.

Take myrrh, one ounce and a half; hepatic aloes, one ounce; proof spirit, two pounds; rectified spirit, half a pound. Digest the myrrh in both spirits for three days with a gentle heat; afterwards add the aloes, and digest again for three days longer, frequently shaking the bottle. Then strain off the tincture. This tincture is well known for its use in healing slight wounds and detaching ulcers when foul. Gentlemen who travel should never ride abroad without it, as it is a speedy and efficacious remedy, (either alone, or mixed with an equal quantity of oil of turpentine,) for warbles and lamenesses in the feet, occasioned by nails, thorns, gravel, or any other extraneous substances. The part affected should be frequently wetted with it, after the offending body has been extracted. Though much cheaper, it will amply supply the place of a more costly composition, called Turlington's balsam, to which it is not in the least inferior, for external application.

No. 42. TINCTURE OF OPIUM, OR LAUDANUM.

Take crude opium, two ounces; and proof spirit, one pound. Digest four days, and strain off the tincture. The virtues of opium are as extensive as those of any other article whatever in the materia medica. As answering the purposes of mitigating pain, allaying inordinate action, and diminishing sensibility, no medicine can be employed with greater advantage in a variety of different

diseases than opium; and though, in some inflammatory cases, the premature use of it may not be altogether proper, yet as it affords a temporary relief in the violence of an acute complaint; and has a very quick effect upon the whole system, in all cases of extreme pain it ought on such occasions to be had immediate recourse to.

No. 43. NERVOUS TINCTURE.

Take valerian, mustard seed, and horse-radish, two ounces each; long pepper, two drachms. Infuse in three pints of port wine, and strain off the tincture; then add four ounces of compound spirit of lavender. This tincture is given internally with success, in paralytic and nervous disorders; and may also be administered with much advantage in cases of scouring, to the extent of three or four pints a day.

OINTMENTS.

Ointments are used with various intentions in farriery; some for mollifying and moistening; others for drying the parts they are applied to; some for digesting tumours and callosities; others for stimulating and blistering particular parts. Hence they are distinguished by various names, according to their nature and operation, as well as from the articles of which they are composed.

No. 44. DESICCATIVE OINTMENTS.

I. Take oil of turpentine, two ounces; ointment of elder, four ounces; sugar of lead, half an ounce; white vitriol, two drachms. Mix them in a gallipot, after reducing the sugar of lead and the vitriol to a fine powder. The buds and swellings in the farcy must be anointed with this; and as often as they become dry, the ointment should be repeated, till the sores begin to run. If the matter be thick and well digested, the disease will soon terminate.

II. Take simple diachylon plaster and olive oil, three ounces each. Melt them together, and add sugar of lead and camphor in fine powder, each three drachms, and stir the ointment frequently, till it is cold. This is a very proper ointment for the grease, and cracked heels. The parts should be well washed with a strong soap lather, before applying the ointment. If they are very foul, they must also be previously bathed with a mixture of vinegar and tincture of myrrh, equal parts each.

No. 45. DIGESTIVE OINTMENTS.

I. Take yellow rosin, two pounds; common turpentine, one pound; lard, one pound and a half; bees wax, half a pound. Mix.

II. Take yellow rosin, three pounds; linseed oil, one pint; wax, 12 ounces. Mix.

Red Digestive Ointment.

III. Take digestive ointment, (No. 1.) four ounces; red precipitate, half an ounce. Mix them cold with a knife, or spatula. This last, applied early, will prevent a fungus, or proud flesh, from shooting out: for if dressed too long with the above digestive, the fungus will rise fast, and give some trouble to suppress it; when it will be necessary to wash the sore, as often as it is dressed, with a solution of blue vitriol in water, or to sprinkle it with burnt alum and precipitate.

No. 46. OINTMENT FOR THE MANGE.

Take sulphur vivum, eight ounces; white hellebore powder, four ounces; sal ammoniac, one ounce; hog's lard and oil, each eight ounces. Mix. This ointment generally succeeds in curing the mange; but where the disease is inveterate, it must be accompanied with proper alteratives; and the yellow mercurial ointment, No. 48, applied to the sorest parts.

No. 47. BLISTERING OINTMENTS.

I. Take Venice turpentine, two ounces; hog's lard, one ounce; cantharides and euphorbium finely powdered, each half an ounce. Mix.

II. Take of the above, and strong mercurial ointment, (No. 49,) each two ounces; corrosive sublimate, one drachm. Mix.

III. Take ointment of elder, or any other soft ointment, four ounces; cantharides and euphorbium in powder, half an ounce each; oil of origanum, two ounces. Mix.

IV. To make it very strong, add to this last, one ounce or one ounce and a half of strong mercurial ointment, or two drachms of sublimate in powder. The hair is to be cut as close as possible, and then the ointment applied pretty thick over the part. This should be done in the morning, and the horse kept tied up all day without any litter till night; when he may be untied, in order to lie down; and a pitch or any sticking plaster may be laid over it, and bound on with a broad tape or bandage to keep all close. After the blister has done running, and the scabs begin to dry and peel

peel off, it may be applied a second time, and in the same manner a third, fourth, or as many more times as the case may require.

No. 48. OINTMENT OF NITRATED QUICKSILVER, or YELLOW MERCURIAL OINTMENT.

Dissolve one ounce of quicksilver in an equal quantity of nitrous acid; add to it one ounce of lard, and as much olive oil previously melted, stirring them frequently together, till cold.

No. 49. STRONG MERCURIAL OINTMENT.

Take quicksilver, four ounces; hog's lard, three ounces; tallow, one ounce. Melt a little of the lard, keeping it on the fire till it be somewhat burnt; with this rub the quicksilver till it be extinguished. Then add to it the rest of the lard and the tallow, melted together.

No. 50. MEL ÆGYPTIACUM, EGYPTIAN HONEY OR OINTMENT.

Take verdigrise in fine powder, two ounces; honey, six ounces; vinegar, four ounces. Boil them over a gentle fire till they acquire a reddish colour.

POULTICES and CATAPLASMS.

"Poultices, says Mr. Bartlett, are of such real and extensive use in farriery, that we thought the composition of them could not be too general. How simple soever the ingredients may appear to some (which are generally at hand,) yet they will be found to answer most intentions, where present ease is to be obtained by warmth, softening, and relaxing, the injured part. Many are the cases which demand such assistance, as recent swellings, inflammations, treads, bruises, cracked and swelled heels and feet, burns, scalds, bruised and lacerated wounds from stumps, thorns, glass, nails, &c. which last are much better treated with such simple emollient applications, than by hot oils or scalding plasters dropt into the wounds; which, under the absurd notion of drawing, but too often sear up the mouths of the vessels, hinder digestion, and consequently increase both pain and inflammation. In short, it is certain that very great services are daily done by the use of poultices, not only in those disorders to which the human body is incident, but also in those wherewith the brute part of the creation is afflicted. One advantage which they have over most outward applications is peculiar to them, that they convey and retain an additional heat, besides what is often in the ingredients; and as most of them have also something emollient in their composition, they must necessarily soften and relax the skin and vessels, abate tension, attenuate and thin viscid and obstructed juices, so that their return into the common course of circulation, or discharge by the pores of the skin, must in general be much better answered by poultices than by other methods."

FARRINGDON, a town of England, in Berks, N. W. of Oxford.

FARSA, a town of European Turkey in Thessaly, anciently called Pharsalia. It is 14 miles S of Larissa.

FARISTAN or **FARS**, a province of Persia, bounded on the N. by a desert, which separates it from Chorasán; on the E. by the Gulf of Persia; and W. by Chusistan. It is 420 miles long from N. to S. and 360 broad from E. to W. The S. part of it is hot, sandy, and barren; the N. mountainous, and abounding in wild boars, falcons, &c. The centre is fertile. Its chief productions are rice, fruits, wood, mastic, and emeralds.

FARTACH, **FARTAK**, or **FARTAQUE**, a sea-port of Arabia Felix, in the province of Hadramaut. It is 480 miles E. of Mocha. Lon. 68. 10. E. Lat 14. 40. N.

FARTHING, [*feorthling*, Sax. from *feower*, four, that is, the fourth part of a penny,] the fourth of a penny; the smallest English coin.

FARTHING OF GOLD, a coin used in ancient times, containing in value the farthing or fourth part of a noble, or 20d. silver. It is mentioned in stat. 9 Hen. V. cap. 7, where it is enacted, that there shall be good and just weight of the noble, half-noble, and farthing of gold.

FARTHING OF LAND, seems to differ from farding-deal. For in a survey book of the manor of West Hapton in Devonshire, there is an entry thus: "A. B. holds six farthings of land at 126l. per ann." So that the farthing of land must have been a considerable quantity, far more than a rood.

No. 51. MUSTARD POULTICE.

Take flour of mustard, four ounces; cantharides, half an ounce; linseed powder, half a pound; vinegar, enough to make a poultice. This is a powerful stimulant in rheumatic swellings, where blistering can be dispensed with.

No. 52. EMOLLIENT POULTICE.

Take coarse bread, barley meal, and camomile or elder flowers, each a handful; boil over the fire in a sufficient quantity of milk, or in the decoction for the fomentation; into which stir about a third (of the whole quantity) of white lily root, washed clean and pounded to a paste; adding linseed and fenugreek in powder, of each an ounce; stirring in, while hot, of turpentine, two ounces, and of lard, four ounces; laying it on moderately warm, and bandaging firmly. To serve for two poultices.

No. 53. TURNIP POULTICE.

Take boiled turnips and brown bread, or linseed meal, one pound each; mash them well over a fire, adding by degrees a proper quantity of stale strong beer to bring them to due consistence; then stir in one ounce of the best flour of mustard; two ounces of oil of turpentine, and four ounces of hog's lard. This poultice is useful for the grease.

No. 54. STIMULANT CATAPLASM.

Take mustard seed pounded small, or mustard ready made, a pint; garlic, six heads; camphor, two ounces; soap, enough to make a poultice.

No. 55. DISCUTIENT CATAPLASM.

Take crumb of white bread, eight ounces; white hard soap, one ounce; milk, a sufficient quantity to make a poultice. Boil the whole together for a little time.

FOMENTATIONS and PLASTERS.

No. 56. RESTRINGENT FOMENTATION.

Take oak bark, one ounce; pomegranate rind, half an ounce; smithy water, three pints. Boil them to two pints, and add two drachms of rock alum. Dip flannel in this decoction, and bind it about the parts, while the horse stands in the stable.

No. 57. STRENGTHENING PLASTER.

Take black rosin, and Burgundy pitch, four ounces each; diachylon plaster, two pounds; colcothar of vitriol, one pound. Mix.

No. 58. DISCUTIENT FOMENTATION.

Take burnt alum and white vitriol, two ounces each; mel Ægyptiacum, one ounce; lime water, three pints. Mix and foment with it three times a day. Those who wish to pursue the study of farriery further would do well to consult the works of Messrs. Clark, Talpin, Lawrence and Blane, on this subject.

FARTREY, a river of Ireland, which runs into the Irish sea. It is nine miles N. of Wicklow.

FASCENINA, or **FASCINATA**, [low Lat.] pales, fascines, &c. used to inclose ancient castles.

FASCES, in Roman antiquity, axes bound up together with rods or staves, and carried before the Roman magistrates as a badge of their authority and office. The use of the fasces was introduced by the elder Tarquin, as a mark of sovereign authority: in after times they were before the consuls, but by turns only, each his day. They had twelve of them carried by so many lictors. After the consuls, the prætors assumed them, and Censorinus observes they had only two, though Plutarch and Polybius give them six. In the government of the decemviri, it was the practice at first for only two of them to have the fasces. Afterwards, each of them had twelve, in the same manner as the kings.

FASCETS, in the art of making glass, are the irons thrust into the mouths of bottles, in order to convey them to the annealing tower.

FASCIA, in antiquity, a thin sash which the Roman women wrapped round their bodies, next to the skin, to make them slender. Something of this sort seems also to have been in use among the Grecian ladies. See Terence. Eun. Act. 2. Sc. 4.

FASCIA, in architecture, signifies any flat member having a considerable breadth and but a small projecture, as the band of an architrave, larmier, &c. In brick buildings, the juttings out of the bricks beyond the windows in the several stories except the highest are called fasciæ.

FASCIE.

Skeleton of the Horse.

*Thoracic & Abdominal,
Viscera, Blood Vessels, &c.
of the Horse.*

FASCIE, in astronomy, certain parts on Jupiter's body resembling belts or swathes. They are more lucid than the rest of that planet, and are terminated by parallel lines, sometimes broader and sometimes narrower. M. Huygens observed a fascia in Mars much broader than those of Jupiter, and possessing the middle part of his disk, but very obscure. See **ASTRONOMY**.

FASCINATION, [from the Greek *βασκανισμός*, to fascinate or bewitch,] a sort of witchcraft which operates either by the eye or the tongue. Ancient writers distinguish two sorts of fascination, one performed by looking, or the efficacy of the eye. Such is that spoken of by Virgil in his third eclogue:

Nescio quis teneros oculus mihi fascinat agnos.

The second by words, and especially malignant praises: Such is that mentioned in his seventh eclogue:

*Aut, si ultra placitum laudârit, baccare frontem
Cingite, ne vati noceat mala lingua futuro.*

Horace touches on both kinds in his first book of epistles:

*Non istic obliquo oculo mea commoda quisquam
Limat, non odio obscuro, morsuque venenat.*

FASCINES, in fortification, faggots of small wood, of about a foot diameter, and six feet long, bound in the middle, and at both ends. They are used in raising batteries, making chandeliers, in filling up the moat to facilitate the passage to the wall, in binding the ramparts where the earth is bad, and in making parapets of trenches to screen the men. Some of them are dipped in melted pitch or tar; and, being set on fire, serve to burn the enemy's lodgments or other works.

FASCIOLA, in zoology, the **FLUKE** or **GOURD WORM**, a genus of insects of the order of vermes intestina. Body flattish, with a vent-hole at the extremity and on the belly. See Plate XXXVII. There are about fifty species:

F. BARBATA, is white, with transverse papillæ in the mouth. It is of an oblong shape, and about the size of a cucumber seed. It is found in the intestines of sepia lotigo.

F. HEPATICA, the **LIVER FLUKE** grows to two-thirds of an inch in length, though it is more usually met with not half that size; and its breadth is nearly equal to two-thirds of its length: it is flattish, but somewhat rounded on the back, and has about eight deep longitudinal furrows in two series; its skin is soft and whitish, with a tinge of brown. The hinder part is rounded, the fore part is furnished with a large mouth; it bears some resemblance to the seed of the common gourd, whence it has acquired the name of the gourd worm. It is found in fresh waters, in ditches, at the roots of stones, sometimes in the intestines, and often in the substance of the other viscera in quadrupeds. It often infests the livers of sheep, and on that account is called hepatica. Bags with salt in them should be placed in the fold that the sheep may lick them, which is the only remedy.

F. INTESTINALIS, or **INTESTINAL FLUKE**, of a long slender form, when extended; when contracted, of a suboval form. It inhabits the intestines of fresh water fish, particularly breams.

FASHION-PIECES, in the sea-language, the aftmost timbers of a ship, which terminate the breadth, and form the shape of the stern. They are united to the stern-post, and to the extremity of the wing-transom, by a rabbit, and a number of strong nails or spikes driven from without.

FAST, or **FASTING**, in general, denotes the abstinence from food; but is more particularly used for such abstinence on a religious account. Solemn fasts have been observed in all ages and nations, especially in times of mourning and affliction. Among the Jews, the calamities for which fasting was enjoined, were a siege, the sword, pestilence, locusts, the caterpillar, diseases, famine, and the like. Upon these days, they wore sack-cloth next the skin, their cloaths were rent, and they wore no shoes: they likewise sprinkled ashes upon their heads, and neither washed their hands, nor anointed their bodies with oil, as usual. The neighbouring heathens, viz. the Egyptians, Phœnicians, and Assyrians, also had their fasts. The Egyptians, according to Herodotus, sacrificed a cow to Isis, after having prepared themselves by fasting and prayer: a custom which he likewise ascribes to the women of Cyrene. Porphyry affirms, that the Egyptians, before their stated sacrifices, always fasted many days, sometimes six weeks; and that the least behoved to be for seven days; during all which

time the priests and devotees not only abstained from flesh, fish, wine, and oil; but even from bread, and some kinds of pulse. These austerities were communicated by them to the Greeks, who observed their fasts much in the same manner. The Athenians had the Eleusinian and Thesmophorian fasts, the observation of which was very rigorous, especially among the women, who spent one whole day sitting on the ground in a mournful dress, without taking any nourishment. In the island of Crete, the priests of Jupiter were obliged to abstain all their lives from fish, flesh, and baked meats. Apuleius informs us, that whoever had a mind to be initiated in the mysteries of Cybele, were obliged to prepare themselves by fasting ten days; and, in short, all the Pagan deities, whether male or female, required this duty of those that desired to be initiated into the mysteries, of their priests and priestesses that gave the oracles, and of those that came to consult them. Among the heathens fasting was also practised before some of their military enterprises. Aristotle informs us, that the Lacedæmonians having resolved to succour a city of the allies, ordained a fast throughout the whole extent of their dominions, without excepting even the domestic animals: and this they did for two ends; one to spare provisions in favour of the besieged; the other to draw down the blessing of heaven upon their enterprise. The inhabitants of Tarentum, when besieged by the Romans, demanded succours from their neighbours of Rhegium, who immediately commanded a fast throughout their whole territories. Their enterprise having proved successful by their throwing a supply of provisions into the town, the Romans were obliged to raise the siege; and the Tarentines, in memory of this deliverance, instituted a perpetual fast. Fasting has for ages been reckoned a particular duty among philosophers and religious people, some of whom have carried their abstinence to an incredible length. At Rome it was practised by kings and emperors themselves. Numa Pompilius, Julius Caesar, Augustus, Vespasian, &c. had their stated fast days; and Julian the apostate was so exact in this observance as to outdo the priests themselves, and even the most rigid philosophers. The Pythagoreans kept a continual lent; but with this difference, that they believed the use of fish to be equally unlawful with that of flesh. Besides their constant temperance, they also frequently fasted rigidly for a very long time. The gymnosophists, or Brachmans of the east, are also very remarkable for their severe fastings; and the Chinese, according to father le Comte, have also their stated fasts, with forms of prayer for preserving them from barrenness, inundations, earthquakes, &c. The Mohammedans too, who possess so large a part of Asia, are very remarkable for the strict observance of their fasts; and the exactness of their dervises in this respect is extraordinary.

FASTERMANS, or **FASTING-MEN**, [q. d. *hōmīnes habentes*,] was used in our ancient customs for men in repute and substance; or rather for pledges, sureties, or bondsmen, who, according to the Saxon polity, were fast bound to answer for one another's peaceable behaviour.

FASTI, in Roman antiquity, a chronicle or register of time, wherein the several years were denoted by the respective consuls, with the principal events that happened during their consulates; these were called also

FASTI CONSULARES, or **CONSULAR FASTI**.

FASTI, or **DIES FASTI**, also denoted the court days. The word *fasti* is formed of the verb *fari*, "to speak," because during those days the courts were opened, causes might be heard, and the pretor was allowed *fari*, to pronounce the three words, *do, dico, addico*: The other days wherein this was prohibited, were called *nefasti*: thus Ovid,

*Ille nefastus erit, per quem tria verba silentur:
Fastus erit, per quem lege licebit agi.*

These dies *fasti* were noted in the calendar by the letter F: but there were some days *ex parte fasti*, partly *fasti*, partly *nefasti*, i. e. justice might be distributed at certain times of the day, and not at others. These days were called *intercisi*, and were marked in the calendar thus, F. P. *fasto primo*, where justice might be demanded during the first part of that day.

FASTI signified also the calendar wherein were expressed the several days of the year, with their feasts, games, and other ceremonies. There were two sorts of *fasti*, the *magistrales*, and *calendares*, or the greater and less.

1. **FASTI CALENDARES**,

1. **FASTI CALENDARES**, which were what was properly and primarily called *fasti*, are defined by Festus Pompeius to be books containing a description of the whole year: *z. c.* Ephemerides, or diaries, distinguishing the several kinds of days, *festi*, *profesti*; *fasti*, *nefasti*, &c.

2. **FASTI MAGISTRALES**, the greater *fasti*, expressed the several feasts, with every thing relating to the gods, religion, and the magistrates; the emperors, their birth-days, offices, days consecrated to them, and feasts and ceremonies established to their honour, or for their prosperity, &c. With a number of such circumstances did flattery at length swell the *fasti*; when they became denominated *Magni* to distinguish them from the bare calendar, or *fasti calendares*.

FAT, an oily and sulphureous matter, secreted from the blood, and deposited in the cells of the *membrana adiposa*, from the innumerable little vessels which are spread amongst them. The fat is to be found immediately under the skin, in most parts of the body. There are two sorts of fat; one yellow, soft, and lax, easily melted; another firm, white, brittle, and not so easily melted, called *suet* or *tallow*. Some reckon the marrow of the bones for a third sort of fat. See **ANATOMY**.

FAT, in the sea language, signifies the same with broad. Thus a ship is said to have a fat quarter, if the trussing in or tuck of her quarter be deep.

FAT, [perhaps properly *vat*, from *vas*, a vessel.] likewise denotes an uncertain measure of capacity. Thus a fat of isinglass contains from 3½ hundred weight to 4 hundred weight; a fat of unbound books half a maund or four bales; of wire, from 20 to 25 hundred weight; and of yarn, from 220 to 221 bundles.

FATA MORGANA, a very remarkable aerial phenomenon, which is sometimes observed from the harbour of Messina, and adjacent places, at a certain height in the atmosphere. The name, which signifies the Fairy Morgana, is derived from an opinion of the superstitious Sicilians, that the whole spectacle is produced by fairies, or such like visionary invisible beings. The populace are delighted whenever it appears; and run about the streets shouting for joy, calling every body out to partake of the glorious sight. This singular meteor has been described by various authors: but the first who mentioned it with any degree of precision was Father Angelucci, whose account is thus quoted by Mr. Swinburne in his "Tour through Sicily:" "On the 15th of August 1643, as I stood at my window, I was surprised with a most wonderful delectable vision. The sea that washes the Sicilian shore swelled up, and became, for ten miles in length, like a chain of dark mountains; while the waters near our Calabrian coast grew quite smooth, and in an instant appeared as one clear polished mirror, reclining against the aforesaid ridge. On this glass was depicted, in *châtro scuro*, a string of several thousands of pilasters, all equal in altitude, distance, and degree of light and shade. In a moment they lost half their height, and bent into arcades, like Roman aqueducts. A long cornice was next formed on the top, and above it arose castles innumerable, all perfectly alike. These soon split into towers, which were shortly after lost in colonnades, then windows, and at last ended in pines, cypresses, and other trees, even and similar. This is the Fata Morgana, which for 26 years I had thought a mere fable."—To produce this pleasing deception, many circumstances must concur, which are not known to exist in any other situation. The spectator must stand with his back to the east, in some elevated place behind the city, that he may command a view of the whole bay; beyond which the mountains of Messina rise like a wall, and darken the back ground of the picture. The winds must be hushed, the surface quite smoothed, the tide at its height, and the waters pressed up by currents to a great elevation in the middle of the channel. All these events coinciding, as soon as the sun surmounts the eastern hills behind Reggio, and rises high enough to form an angle of 45 degrees on the water before the city, every object existing or moving at Reggio will be repeated 1000 fold upon this marine looking-glass; which, by its tremulous motion, is as it were cut into facets. Each image will pass rapidly off in succession as the day advances, and the stream carries down the wave on which it appeared. Thus the parts of this moving picture will vanish in the twinkling of an eye. Sometimes the air is at that moment so impregnated with vapours, and undisturbed by winds, as to reflect objects in a kind of aerial screen, rising about thirty feet above the level of the sea. In cloudy heavy weather, they are drawn

on the surface of the water, bordered with fine prismatical colours. To the above account we shall add the following, given by M. Houel, whose judgement and veracity render his authority highly respectable. "In fine summer days, when the weather is calm, there rises above the great current a vapour, which acquires a certain density, so as to form in the atmosphere horizontal prisms, whose sides are disposed in such a manner, that when they come to their proper degree of perfection, they reflect and represent successively, for some time (like a moveable mirror,) the objects on the coast or in the adjacent country. They exhibit by turns the city and suburbs of Messina, trees, animals, men, and mountains. They are certainly beautiful aerial moving pictures. There are sometimes two or three prisms, equally perfect; and they continue in this state eight or ten minutes. After this, some shining inequalities are observed upon the surface of the prism, which render confused to the eye the objects which had been before so accurately delineated, and the picture vanishes. The vapour forms other combinations, and is dispersed in air. Different accounts have been given of this singular appearance; which for my part I attribute to a bitumen that issues from certain rocks at the bottom of the sea, and which is often seen to cover a part of its surface in the canal of Messina. The subtle parts of this bitumen being attenuated, combined, and exhaled, with the aqueous globules that are raised by the air, and formed into bodies of vapour, give to this condensed vapour more consistence; and contribute, by their smooth and polished particles, to the formation of a kind of aerial crystal, which receives the light, reflects it to the eye, and transmits to it all the luminous points which colour the objects exhibited in this phenomenon, and render them visible." An account of this appearance is given from a treatise by Menasi, in Nicholson's "Journal," 4to. vol. i. p. 225, with a large engraving. See Priestley's "Optics for Atmospheric Phenomena," Huddart and Vince in the "Philosophical Transactions," 1797 and 1799. These are also in Nicholson's "Journal."

FATAGAR, a country of Africa, S. E. of Abyssinia. Lon. 39. 0. E. Lat. 9. 0. N.

FATE, denotes an inevitable necessity depending upon a superior cause. The word is formed from *fari*, *fatum*, to speak; and primarily implies the same with *effatum*, viz. a word or decree pronounced by God; or a fixed sentence whereby the Deity has prescribed the order of things, and allotted to every person what shall befall him. The Greeks called it *μαρτυρη*, as it were a chain or necessary series of things indissolubly linked together. It is also used to express a certain unavoidable destination of things, by which all agents, both necessary and voluntary, are swayed and directed to their ends. See **NECESSITY**. In this last sense, fate is distinguished into *Astrological* and *Stoical*, by the ancients; but by later authors, into *Divine* and *Physical*.

1. **FATE ASTROLOGICAL**, that arising from the influence and position of the heavenly bodies, which were supposed both to give laws to the elements and mixed bodies, and to the wills of men.

2. **FATE STOICAL**, is defined by Cicero a series of causes, wherein, cause being linked to cause, each produces another, and thus all things flow from one prime cause. To this fate the Stoics subjected even the gods.

3. **FATE, DIVINE**, is what is more usually called Providence. See **PROVIDENCE**.

4. **FATE, PHYSICAL**, is an order and series of natural causes appropriated to the effects. By this fate it is that fire warms, bodies communicate motion to each other, &c. and the effects of it are all the events and phenomena of nature.

FATEMITES, FATHIMITES, or FATHIMITES, the descendants of Mohammed by Fathema, or Fatima, his daughter. They never enjoyed the khalifat of Mecca or Bagdad, but reigned in Barbary and Egypt.

FATES, in mythology. See **PARCÆ**.

FATHER, [*father*, Saxon. This word is found likewise in the Persian language,] a well-known term of relation. See **PARENT**. By the laws of Romulus, a father had an unlimited power over his children. Amongst the Lacedæmonians, as we learn from Aristotle's politics, the father of three children was excused from the duty of mourning guard for the security of the city; and a father of four children was exempted from every public burden. The Poppæan law, amongst the Romans, granted many valuable privileges to the fathers of three children; amongst which one

was, that he should be excused from civil offices, and that the mother should have liberty, in her father's life-time, to make a will, and manage her estate without the authority of tutors.

FATHER, in theology, is used in speaking of the first Person of the ever-blessed Trinity. See **TRINITY**.

FATHER is also used in speaking of spiritual and moral things. Thus, Abraham is called the father of the faithful.

FATHER, in church history, is applied to ancient authors who have preserved in their writings the tradition of the church. Thus St. Chrysostom, St. Basil, &c. are called Greek fathers, and St. Augustine and St. Ambrose Latin fathers. No author who wrote later than the twelfth century is dignified with the title of Father.

FATHER is also a title of honour given to prelates and dignitaries of the church, to the superiors of convents, to congregations and ecclesiastics, and to persons venerable for their age or quality. Thus we say the right reverend father in God, the father general of the benedictines, the fathers of the council of Nice, father of his country, &c.

FATHOM, [*fædm*, Saxon,] a measure of length containing six feet, or two yards; the space to which a man can extend both arms.

FATNESS. See **CORPULENCY**. It is said, that for one fat person in France or Spain, there are 100 in England and Holland.

FATSISIO, an island of Japan, barren and almost inaccessible, 80 miles from the S. coast of Nippon.

FATTENING OF COLOURS, is a term employed by painters, and signifies a coagulation of the oil, which is occasioned by mixing it with several kinds of pigments: hence, when it has been kept for a considerable time, it becomes so viscid and glutinous, as to be wholly incapable of being worked, either with the brush or pencil. In this state, a due proportion of fresh oil should be added.

FATTIPOUR, or **FATEPOUR**, a town of Hindostan in the province of Agra, 25 miles W. of Agra.

FATUA, in mythology, the wife of the god Faunus, who was supposed to inspire women with the knowledge of futurity, as Faunus himself did the men.—Fatua had her name from *furi*, q. d. *vaticinari*, to prophesy. See **FAUNA**.

FATUARI, in antiquity, where persons who, appearing inspired, foretold things to come.

FAVAGNANA, or **FOVOGNANA**, a fertile island on the W. coast of Sicily, 15 miles in circumference, with a fort. Lon. 12. 25. E. Lat. 38. 16. N.

FAVANI, a river of Naples, which runs into the sea, 9 miles S. S. E. of Squillace.

FAVARA, a river of Sicily, which runs into the Mediterranean, 5 miles S. of Modica.

FAUCIGNY, or **FAUSSIGNY**, a late province of Savoy, now annexed to France, and included in the department of Mont Blanc.

FAVERNEY, a town of France in the department of Upper Saône, 8 miles N. of Vesoul.

FAVISSÆ, in antiquity, were, according to Festus and Gellius, cisterns to keep water in.

FAULQUEMONT, a town of France, in the department of Moselle, seated near the Nied, 16 miles E. of Metz.

FAUNA, a deity among the Romans. She was daughter to Picus, and was originally called Manica. Her marriage with Faunus procured her the name of Fauna, and her knowledge of futurity those of Fatua and Fatidica. It is said, that she never saw a man after her marriage with Faunus, and that her uncommon chastity occasioned her being ranked among the gods after her death. She is the same, according to some, with Bona Mater.

FAUNALIA, in antiquity, Roman feasts celebrated in honour of the god Faunus, who was the same among the Romans with Pan of the Greeks. The Faunalia were held on the nones or 5th of December. The principal sacrifice was a roe-buck: or rather, according to Horace, a kid, attended with libations of wine and burning of incense. It was properly a country festival, being performed in the fields and villages with peculiar joy and devotion. Horace gave a very gay description of it, in Lib. iii. Ode 18.

FAUNI, or **FAUNS**, among the ancients, were a species of demi-gods, inhabiting the forests; called also Sylvani, and little

differing from the Satyrs. They were said to delight in vineyards: and generally appear as attendants of Bacchus, in the representations of Bacchanal feasts and processions. They were represented as half men, half goats, having the horns, ears, feet, and tail, of a goat, a very flat nose, and the rest human.

FAUNUS, in fabulous history, the son of Picus, who reigned in Italy, about 1300 years before the Augustan age. His bravery, as well as wisdom, gave rise to the tradition, that he was the son of Mars. His great popularity, and his fondness for agriculture, made his subjects revere him as one of their country deities after his death. He was represented with all the equipage of the satyrs, and was consulted to give oracles.

FAVONIUS, among the Romans, the wind which blew directly from the west.

FAVORITO, in music, as choro favorito, a chorus in which are employed the best voices and instruments, to sing the recitatives, play the ritornellas, &c.; this is otherwise called the little chorus, or choro recitante.

FAUSSEBRAYE, a small mount of earth, four fathoms wide, erected on the level round the foot of the rampart, to fire upon the enemy, when he is so far advanced that you cannot force him back; and also to receive the ruins which the cannons make in the body of the place.

FAUSSIGNY. See **FAUCIGNY**.

FAWKES, FRANCIS, an ingenious poet, who was educated at Leeds, whence he was transplanted to Jesus College, Cambridge, where he took the degree of M. A. Entering into orders, he settled first at Bramham in Yorkshire, near Mr. Lane's elegant seat, which he celebrated in verse in 1745. His first poetical publications were, "Gavin Douglas's Description of May and Winter modernised." Removing afterwards to Croydon in Surrey, he recommended himself to the notice of Archbishop Herring, to whom he addressed an Ode on his recovery in 1754, printed in Dodsley's Collection; and who collated him in 1755 to the vicarage of Orpington. Mr. Fawkes lamented his patron's death in 1757, in a pathetic Elegy, entitled "Aurelius," first printed in 1763. He married at this time Miss Purrier of Leeds. In April 1774, he exchanged his vicarage for the rectory of Hayes. He was also one of the chaplains to the Princess Dowager of Wales. He published a volume of Poems by subscription in 8vo. 1761; the Poetical Calendar in 1763; and Poetical Magazine, 1764, in conjunction with Mr. Woty; Partridge-shooting, an Eclogue, 1767, 4to.; and a Family Bible, with notes, in 4to, a compilation. But his great strength lay in translation, in which few, since Pope, have equalled him. Witness his fragments of Menander, his Works of Anacreon, Sappho, Bion, Moschus, and Musæus, 12mo. 1760; his Idylliums of Theocritus, 8vo. 1767, and his Argonautics of Apollonius Rhodius; both by subscription, but the latter posthumous, and completed by the Rev. Mr. Meen, in 8vo. 1780. He died Aug. 26, 1777.

FAWN, among sportsmen, a buck, or doe, of the first year; or the young one of the buck's breed in its first year.

FAYAL, the most western of the Azores. It is about 27 miles long and 9 broad; and abounds in cattle, fowls, fish, and beech-trees. The chief town is Villa Horta.

FAYENCE, a town of France, in the department of Var, 10 miles N. E. of Draguignan. Lon. 7. 0. E. Lat. 43. 38. N.

FAYETTE, a county of Kentucky, surrounded by Clarke, Bourbon, Scott, Franklin, Woodford, Maddison, and Mercer counties. Lexington is the capital.

FAYETTE, a county of Pennsylvania, bounded on the N. by Westmoreland, E. by Somerset, S. by the States of Maryland and Virginia, and W. by the Monongahela. The western parts are fertile; the eastern mountainous, abounding in iron ore. Two iron manufactories are established in it.

FAYETTE, a district of North Carolina, comprehending six counties, bounded on the N. by Hillsborough, S. E. by Wilmington and Newbern, S. by South Carolina, and W. by Salisbury.

FAYETTEVILLE, a flourishing town of North Carolina, the capital of Cumberland county, and of Fayette district; seated in a settlement of Scots Highlanders, on the N. W. branch of Cape Fear river, 55 miles N. W. of Camden.

FAYOUM, or **FEIUM**, a province of Egypt, on the W. side of the Nile, extending from that river to Moeris, now Bir-

Ket el Korum. It was anciently called Arsinoe, and intersected by canals, cut by the ancient Egyptians between the river and the Lake of Moeris; but though formerly very wealthy and fertile, it is greatly declined, through the oppressions of the Mamelukes.

FAVOUR, the capital of the above province, is seated on Joseph's Canal, which runs through it, and surrounded by gardens; 49 miles S. S. W. of Cairo.

FE, FO, or FO-HI. See FOHI.

FE, SANTA. See SANTA FE.

FEAL DIKES, a cheap sort of fence common in Scotland; built with feal or sod dug up by the spade, from the surface of grass ground, consisting of the upper mould rendered tough and coherent by the matted roots of grass thickly interwoven with it.

FEALTY, in law, an oath taken on the admittance of any tenant, to be true to the lord of whom he holds his land: by this oath the tenant holds in the freest manner, on account that all who have fee hold per fidem et fiduciam, that is, by fealty at least. This fealty at the first creation of it, bound the tenant to fidelity, the breach of which was the loss of his fee. It has been divided into general and special: general, that which is to be performed by every subject to his prince; and special, required only of such as, in respect of their fee, are tied by oath to their lords. To all tenures, except tenancy at will and frank almoign, fealty is incident, though it chiefly belongs to copyhold estates held in fee and for life. The form of this oath by stat. 17 Ed. II. is to run as follows: "I A. B. will be to you my lord D. true and faithful, and bear to you faith for the lands and tenements which I hold of you, and I will truly do and perform the customs and services that I ought to do to you. So help me God."

FEAR, [*fearan*, Sax. to fear; *vaer*, Dut. *feakle*, Erse.] in scripture, is used in various senses. The fear of God is either filial or servile. Filial fear is a gracious habit in the soul, whereby it is inclined to obey all God's commands, and to hate and avoid evil. Slavish or servile fear is the consequence of guilt; it is an alarm within that disturbs the rest of a sinner; though it often proves preparative to faith and repentance.

FEAR, in the mythology. See PAVOR.

FEAR, in scripture is also frequently taken for a painful apprehension of danger; a dejection of mind; anxious concern for some object; that which causes fear; and the person or thing which is feared. The fear of God is used in three senses. 1. For a terror which arises from a consciousness of guilt and of the justice of God in punishing sin: this fear is removed by accepting the reconciliation made by Jesus Christ the Redeemer, and it preserves us from every other dependence. 2. For that awe, or reverential dread, which arises from the consideration, that God alone possesses all power to communicate happiness or to inflict misery, as seemeth right to him. Thus, Jer. x. 7. "Who would not fear thee, O king of nations? for to thee doth it appertain." This fear directs us to avoid whatever God has forbidden, and to attend with care to his commandments. 3. For that concern and solicitude, to keep at the utmost distance from sin, which arises from a detestation of any breach of God's law, and a consciousness of the weakness and insufficiency of human nature, and of the danger of being led astray without the greatest care and watchfulness. This fear is stiled the beginning of wisdom, that is, one of the principal points of sound wisdom; it makes us circumspect and diligent, and directs us to place an entire dependence on God.

FEAR, one of the passions of the human mind. It is defined, an apprehension of impending evil, attended with a desire of avoiding it. Fear in the extreme is called fright, or terror. See DRAWING and FRIGHT.

FEAST, or FESTIVAL, [Lat. *festum*,] is derived by some from *feriari*, to keep holiday; by others from *ferre*, to feast or entertain; by others, particularly M. Huet, from *festinare*, which is used by Origen in the same sense, in his Comment on Matthew. Social or civil feasts were also expressed by the words *convivium*, *compositio*, or *concanatio*. Cicero observes that *convivium* means "people assembled at table," which is more significant than the Greek words *συναγoge*, or *συνελευσις*; the Latin term expressing the union of body and mind, which ought to take place at an entertainment: the Greek denoting only what relates to the body. We learn from Herodotus, that the ancients had neither cups nor

bowls, at their feasts, but they drank out of little horns tipped with silver or gold. The Greeks and Romans kept a domestic for the purpose of reading during their meals and feasts. Sometimes the chief of the family himself performed the office of reader; and history informs us, that the Emperor Severus often read while his family ate. The time of reading was generally at supper; and guests were invited to a reading as they are now a-days to play cards. The Greeks, in their flourishing times, did not profane, (according to their own expression,) the holiness of the table; but rather adorned it with ingenious and elegant conversation: they proposed moral topics, of which Plutarch has preserved a collection. Heroes rarely assembled convivially without bringing affairs of consequence into discourse, or deliberating upon those that regarded either present events or future contingencies. The Scythians, while at meat, used to make the strings of their bows resound, lest their warlike virtues might be enfeebled or lost in the season of pleasure. People of rank among the Rhodians, by a fundamental law of the state, were obliged to dine daily with those who had the management of affairs, in order to deliberate with them concerning such things as were necessary or useful for the country; and on this account the principal ministers of the kingdom were obliged to keep open table for all who could be of use to the state. The Persians also generally deliberated on business at table, but never determined, or put their determinations in execution, except in the morning before having eaten. Among the Romans, the place where they supped was generally the vestibule, that a more retired part of the house might not encourage licentiousness and disorder. There were several laws that restricted their meals to these vestibules. When luxury reigned in Rome, they had superb halls for their entertainments, Lucullus had many, each of which bore the name of some deity; and this name was a mark which indicated to the servants the expence of the entertainment. The expence of a supper in Lucullus's hall of Apollo amounted to 50,000 drachmas. Singers, dancers, musicians, stage-players, jesters, and buffoons, were brought into these halls to amuse the guests. Plutarch informs us, that Caesar, after his triumphs, treated the Roman people at 22,000 tables; and by calculation it would seem, that there were at these tables upwards of 200,000 persons. Feasting seems to have been the chief delight of the Britons, Germans, Gauls, and all the other Celtic nations; in which they indulged themselves to the utmost, as often as they had opportunity. "Among these nations (says M. Pelloutier, in his Hist. Celt. l. 2. c. 12. p. 463.) there is no public assembly, either for civil or religious purposes, duly held; no birth-day, marriage, or funeral, properly celebrated; no treaty of peace or alliance rightly cemented, without a great feast." When the Germans, says Tacitus, wanted to reconcile enemies, to make alliances, to name chiefs, or to treat of war and peace; it was during the repast, that they took counsel; a time in which the mind is most open to the impressions of simple truths, or most easily animated to great attempts. These artless people during the conviviality of the feast spoke without disguise. Next day they weighed the counsels of the former evening: they deliberated at a time when they were not disposed to feign, and took their resolution when they were least liable to be deceived. It was by frequent entertainments of this kind that the great men or chieftains gained the affections and rewarded the services of their followers, and those who made the greatest feasts were sure to be most popular, and to have the greatest retinue. These feasts (in which plenty was more regarded than elegance lasted commonly several days, and the guests seldom retired until they had consumed all the provisions. Athenæus describes an entertainment that was given by Arcamnes, a very wealthy prince in Gaul, which continued a whole year without interruption, and at which all the people of Gaul, and even all strangers who passed through that country, were made welcome.

FEASTS, or FESTIVALS, in a religious sense, are ceremonies of feasting by way of thanksgiving. Such feasts have made part of the religion of almost all nations and sects; witness those of the Greeks, Romans, Hebrews, Christians, and Mohammedans.

FEASTS, ANCIENT GRECIAN. The first feasts among the Greeks were celebrated in solemn assemblies of the whole nation, on occasion of their games, as the Olympic, the Pythian, the Isthmian, and Nemean: in process of time they had many others, the principal of which are enumerated in the course of this work.

FEASTS, ANCIENT ROMAN. The Romans had also abundance

of stated feasts in honour of their deities and heroes; such were the Saturnalia, Cerealia, Lupercalia, Liberalia, Neptunalia, Consualia, Portumnalia, Vulcanalia, Palilia, Divalia, &c. See these articles. They had also feasts instituted occasionally; as Carmentalia, Quirinalia, Terminalia, Floralia, Compitalia, Lemuria, Vernalia, besides other moveable and occasional ones; as to give thanks to the gods for benefits received; to implore their assistance or to appease their wrath, &c. as the Paganalia, Feralia, Bacchanalia, Ambarvalia, Amburbalia, Suovetaurilia, and divers others, particularly denominated *Feriae*; as *Sementinae*, *Latinae*, &c. See these articles. The feasts were divided into days of sacrifice, and days of banqueting and feasting: days of games, and days of rest or *feriae*. There being but little history written, or at least published, in those days, one end of feasts was to keep up the remembrance of past occurrences.

FEASTS, CHINESE. The Chinese have two solemn religious feasts annually, in memory of Confucius, besides several others of a civil nature, in honour of agriculture, &c.

FEASTS, JEWISH. The principal feasts of the Jews were the feasts of trumpets, that of the expiation, of tabernacles, of the dedication, of the passover, of pentecost, and that of purification. See **EXPIATION**, &c. The modern Jews have other feasts marked in their calendar of modern institution.

FEASTS IN THE CHURCH OF ENGLAND. The four feasts which the English laws take particular notice of are, the Annunciation of the blessed Virgin Mary, or Lady-day, the 25th March; the nativity of St. John the Baptist, held on the 24th of June; the feast of St. Michael the Archangel, on the 29th of September; and that of St. Thomas the Apostle, on the 21st of December; on which quarterly days rent on leases is usually paid. (5 and 6 Edw. VI. cap. 3. 3 Jac. I. cap. 112. Car. II. cap. 30.) Besides these feasts which are general, and enjoined by the church, there are others local and occasional, enjoined by the magistrate, or voluntarily set on foot by the people; such are the days of thanksgiving for victories, delivery from wars, plagues, &c. Such also are the vigils or wakes in commemoration of the dedications of particular churches. See **VIGIL**, &c. The feasts of the church of England are either Immoveable or Moveable:

1. **FEASTS, IMMOVEABLE**, are those constantly celebrated on the same day of the year; the principal of these are Christmas or the Nativity, the Circumcision, Epiphany, Candlemas or the Purification; the Annunciation, called also the Incarnation and Conception; All Saints, and All Souls; besides the days of the several apostles, St. Thomas, St. Paul, &c. which in the church of England, are feasts though not *Feriae*. See these articles.

2. **FEASTS, MOVEABLE**, are those which are not confined to the same day of the year. Of these the principal is Easter, which gives law to all the rest, all of them following and keeping their proper distances from it; such are Palm Sunday, Good Friday, Ash Wednesday, Sexagesima, Ascension-day, Pentecost, and Trinity Sunday. See **EASTER**, **PENTECOST**, **SEXAGESIMA**, **TRINITY**, &c.

FEASTS IN THE CHURCH OF ROME. The prodigious increase of feast days in the Romish church commenced towards the close of the 4th century, and was occasioned by the discovery that was then made of the remains of martyrs and other holy men, for the commemoration of whom they were established. These, instead of being set apart for pious exercises, were abused in indolence, voluptuousness, and criminal practices. Many of them were instituted on a Pagan model, and perverted to similar purposes.

FEASTS, MOHAMMEDAN. The Mohammedans, besides their feast or sabbath, which is kept on Friday, have two solemn feasts, the first of which is called the Feast of Victims, and celebrated on the 10th day of the last month of their year; and the second called Bairam. See **BAIRAM**.

FEASTS OF THE DEAD, solemn religious ceremonies in use among the American Indians. By some nations they are celebrated every eight years; by others, as the Hurons and Iroquois, every 10 years.

FEATHER, in physiology, a general name for the covering of birds; it being common to all the animals of this class to have their whole body, or at least the greatest part of it, covered with feathers or plumage. There are two sorts of feathers found on birds, viz. the strong and hard kind, called quills, found in the wings and tail; and the other plumage, or soft feathers, serving for the de-

fence and ornament of the whole body. All birds, so far as yet known, moult the feathers of their whole body yearly.

FEATHER. See **ORNITHOLOGY**. Feathers make a considerable article in commerce, particularly those of ostriches, herons, swans, peacocks, geese, hens, &c. for plumes, ornaments of the head, filling of beds, writing pens, &c. Geese are plucked sometimes in Great Britain five times in the year, and in cold seasons many of them die by this barbarous custom. The feathers that are brought from Somersetshire are esteemed the best, and those from Ireland the worst. Eider down is imported from Denmark; the ducks that supply it being inhabitants of Hudson's Bay, Greenland, Iceland, and Norway. See **DOWN**. Our own Western Islands breed numbers of these birds, which turn out a profitable branch of trade to the poor inhabitants. Hudson's Bay also furnishes very fine feathers, supposed to be of the goose kind. The down of the swan is brought from Dantzic, as well as great quantities of the feathers of the cock and hen. The London-poulterers deal largely in the feathers of those birds, and of ducks and turkeys: those of ducks being weaker, are inferior to those of the goose; and turkeys feathers are the worst of any. The best method of curing feathers is to lay them in a room, in an exposure to the sun; and when dried, to put them in bags, and beat them well with poles to get the dust off.

FEATHERS are chiefly used for the stuffing of beds, which are certainly less wholesome than wool or horse hair mattresses, and tend greatly to relax and enervate the human body. Within the last two or three years, they have been manufactured into hats; a mode of employing them far preferable to that we have just mentioned. See **PLUME**.

FEATHER, in the manege, a sort of natural frizzling of the hair, which in some parts rises above the rest, resembling the tip of an ear of corn. This happens most frequently between the eyes; and if lower, it is a sign of a weak sight.

MID-FEATHER, in the salt-works, the partition in the middle of the furnace, which it divides into two chambers.

FEATHER-EDGED, among carpenters, an appellation given to planks or boards, which have one side thicker than the other.

FEBRIS, [Lat.] **FEVER**, was worshipped as a goddess by the ancient Romans. She had a temple on mount Palatine, and in other two places in Rome. The following inscription to this goddess is still extant, *FEERI DIVÆ, FEBRI SANCTÆ, FEBRI MAGNÆ, CAMILLA AMATA PRO FILIO MALE AFFECTO*.

FEBRUA, a feast of atonement held by the ancient Romans for 12 days together, in February.

FEBRUA, **FEBRUALIS**, and **FEBRUATA**, names of the goddess Juno.

FEBRUARY, in chronology, was the second month of Numa's year, and under the protection of the god Neptune. It was not in the calendar of Romulus, being added to the year by Numa. It had its name from Februa, a name of Juno, who presided over the purifications of women; and in this month the Lupercalia were held in honour of Juno, and women were purified by the priests of Pan Lyceus at that festival. See **LYPERCALIA**. February, in a common year, consists only of 28 days; but every bissextile year it has 29, by the addition of the intercalary day.

FECAMP, an ancient sea-port of France, in the department of Lower Seine, having 1000 houses, and a Benedictine abbey long famed for its riches. The church is one of the largest in France. The chief trade of the inhabitants is in linens, serges, laces, hats, and leather. Many vessels are employed in the herring fishery. It is 27 miles S.W. of Dieppe, and 15 N.N.E. of Montvilliers.

FECES. The excrementitious matter of animals, evacuated per anum, consists of all that food which cannot be employed for purposes of nutrition, considerably altered, at least in part, and mixed or united with various bodies employed during digestion to separate the useless part of the food from the nutritious.

FECIALES, or **FOECIALES**, an order of priests or officers, consisting of 20 persons among the ancient Romans, appointed to proclaim war, negotiate peace, &c. Festus derives the word from *ferio*, I strike; as, *ferire fœdus* signifies "to conclude a treaty;" and accordingly, instead of *feciales*, he would have it written *feriales*. Others derive it from *fœdus*, which was anciently written *fœdus*; or from *fides*, "faith." Others from *ficio*, *fecit*, I make, &c. because they made war and peace. Vossius derives it from

from *fatu*, of the verb *fare*, "to speak;" in which sense the *feciales* should be the same with orators; which sentiments is also confirmed by Varro, who says they were called indifferently *feciales* and orators. The *feciales* were a sort of heralds, who, when the Romans had any dispute with their neighbours, were sent first to demand the thing pretended to be usurped, or require the satisfaction for the injury alleged to be done. If an answer was not returned by them, that was satisfactory to the people and the senate, they were dispatched again to declare war, and the like in treating of peace; the *feciales* being the only persons appointed to negotiate between the senate, &c. and the enemy.

FEE, [*feoh*, Sax. *fee*, Danish, cattle; *feudum*, low Lat.] in law, all land tenements that are held by any acknowledgement of superiority to a higher lord. All lands and tenements, wherein a man hath a perpetual estate to him and his heirs, &c. are divided into *allodium* and *feudum*; *allodium* is every man's own land, which he possesses merely in his own right, without acknowledgement of any service or payment of any rent to any other. *Feudum*, or *fee*, is that which we hold by the benefit of another, and in name whereof we owe services, or pay rent, or both, to a superior lord.

FEE ABSOLUTE, or FEE SIMPLE. A tenant, says Blackstone, in fee simple, (or, as he is frequently styled, tenant in fee,) is he that hath lands, tenements, or hereditaments, to hold to him and his heirs for ever; generally, absolutely, and simply; without mentioning what heirs, but referring that to his own pleasure, or to the disposition of the law. The true meaning of the word *fee*, (*feodum*), is the same with that of *feud* or *fief*, (See **FEE-DOM** SYSTEM;) and in its original sense it is taken in contradistinction to *allodium*; which is property in its highest degree; and the owner thereof hath *absolutum et directum dominium*, and therefore is said to be seised thereof absolutely in *dominio suo*, in his own demesne. But this *allodial* property no subject in Britain has; it being a received and now undeniable principle in the law, that all the lands are holden mediately or immediately of the king. A subject therefore hath only the usufruct, and not the absolute property of the soil. And hence in the most solemn acts of law, the strongest and highest estate that any subject can have is expressed by these words, "he is seised thereof in his demesne, as of fee." It is a man's demesne, dominion, or property, since it belongs to him and his heirs for ever: yet this property or demesne, is strictly not absolute or *allodial*, but qualified or *feodal*: it is in his demesne, as of fee; that is, it is not purely and simply his own, since it is held of a superior lord, in whom the ultimate property resides. This is the primary sense and acceptation of the word *fee*. But (as Sir Martin Wright very justly observes) the doctrine, "that all lands are holden," having been for so many ages a fixed and undeniable axiom, the English lawyers do very rarely (of late years especially) use the word *fee* in this its primary original sense, in contradistinction to *allodium* or absolute property, with which they have no concern; but generally use it to express the continuance or quantity of estate. A *fee* therefore, in general, signifies an estate of inheritance; being the highest and most extensive interest that a man can have in a *feud*: and when the term is used simply, without any other adjunct, or has the adjunct of simple annexed to it, it is used in contradistinction to a *fee conditional* at the common law, or a *fee-tail* by the statute; importing an absolute inheritance, clear of any condition, limitation, or restrictions, to particular heirs, but descendible to the heirs general, whether male or female, lineal or collateral. And in no other sense than this is the king said to be seised in *fee*, he being the feudatory of no man. Taking therefore *fee* in this its secondary sense, as a state of inheritance, it is applicable to, and may be had in, any kind of hereditaments either corporeal or incorporeal. But there is this distinction between the two species of hereditaments; that of a corporeal inheritance a man shall be said to be seised in his demesne, as of fee; of an incorporeal one he shall only be said to be seised as of fee, and not in his demesne. For as incorporeal hereditaments are in their nature collateral to, and issue out of, lands and houses, their owner hath no property, dominion, or demesne, in the thing itself, but hath only something derived out of it; resembling the servitudes, or services, of the civil law. The dominion, or property, is frequently in one man, while the appendage, or service, is in another. Thus Gaius may be seised as of fee, of a way going over the land, of which Titius is seised in his demesne as of fee.

The *fee simple* or inheritance of lands and tenements is generally vested and resides in some person or other; though divers inferior estates may be carved out of it. As if one grants a lease for 21 years, or for one or two lives, the *fee simple* remains vested in him and his heirs; and after the determination of those years or lives, the land reverts to the grantor or his heirs, who shall hold it again in *fee simple*. Yet sometimes the *fee* may be in *abeyance*, that is (as the word signifies) in expectation, remembrance, and contemplation, in law; there being no person in esse, in whom it can vest and abide, though the law considers it as always potentially existing, and ready to vest whenever a proper owner appears. Thus, in a grant to John for life, and afterwards to the heirs of Richard, the inheritance is plainly neither granted to John nor Richard, nor can it vest in the heirs of Richard, till his death, *nam nemo est hæres viventis*: it remains therefore in waiting, or *abeyance*, during the life of Richard. This is likewise the case of a parson of a church, who hath only an estate therein for the term of his life; and the inheritance remains in *abeyance*. And not only the *fee*, but the freehold also, may be in *abeyance*; as, when a parson dies, the freehold of his glebe is in *abeyance* until a successor be named, and then it vests in the successor. The word heirs is necessary in the grant or donation in order to make a *fee* or inheritance.

FEES, LIMITED, or such estates of inheritances as are clogged and confined with conditions or qualifications may be divided into two sorts, viz. 1. Qualified or base fees: and, 2. Fees conditional, or fees tail.

1. **FEE QUALIFIED, or BASE FEE**, is such as has a qualification subjoined, and which must be determined whenever the qualification annexed to it is at an end. As, in the case of a grant to A and his heirs, tenants in the manor of Dale; in this instance, whenever the heirs of A cease to be tenants of that manor, the grant is entirely defeated.

2. **FEE TAIL** is so called in consequence of the statute de donis, or fee conditional, as it is called at common law, is an estate restrained to some particular heirs, exclusive of others; as to the heirs of a man's body, or to the heirs male of his body: in which cases it was held, that as soon as the grantee had issue born, the estate was thereby converted into *fee simple*, at least so far as to enable him to sell it, to forfeit it by treason, or to charge it with incumbrances. But the statute de donis having enacted, that such estates so given, to a man and the heirs of his body, should at all events go to the issue, if there were any, or if none, should revert to the donor; this was by the judges denominated an estate in tail. Plowd. 251.

FEE also signifies a certain allowance to physicians, barristers, attorneys, and other officers, as a reward for their pains and labour. If a person refuse to pay an officer his due fees, the court will grant an attachment against him, to be committed till the fees are paid; and an attorney may bring an action on the case for his fees, against the client that retained him in his cause.

FEE also denotes a settled perquisite of public officers, payable by those who employ them. The fees due to the officers of the custom-house, are expressly mentioned in a schedule, or table, which is hung up in public view in the said office, and in all other places where the said fees are to be paid or received. And if any officer shall offend, by acting contrary to the regulations therein contained, he shall forfeit his office and place, and be for ever after incapable of any office in the custom-house. The other public officers have likewise their settled fees, for the several branches of business transacted in them.

FEE-FARM, is a tenure without homage fealty, or other service, except that mentioned in the feoffment, which is usually the full rent, or at least a fourth part of it. The nature of this tenure is, that if the rent be behind, and unpaid for two years, then the feoffor and his heirs may have an action for the recovery of the lands.

FEELERS, the horns, or antennæ, of insects.

FEELING is one of the five external senses, by which we obtain the ideas of solidity, hardness, softness, smoothness, roughness, heat, cold, wetness, dryness, and other tangible qualities. This sense, though the coarsest, is the surest and most universal of all others, and is indeed the basis of all other sensations.

FEET-BEARER, an officer in the courts of the ancient Anglo-Saxon and Welsh kings. He was a young gentleman whose duty it

it was to sit on the floor, with his back towards the fire, and hold the king's feet in his bosom all the time he sat at table, to keep them warm and comfortable: a piece of state and luxury unknown in modern times. Leges Wallia, p. 58.

FEHRENBACH, a town of Suabia, 16 miles E. of Friburg.

FEHRENLIN, a town of Upper Saxony, in the Middle Mark of Brandenburg, 28 miles N.W. of Berlin.

FEJEE, one of the Friendly Islands, three days sail N.W. by W. of Tongataboo. It abounds, in hogs, dogs, fowls, roots, and fruits.

FEINT, in fencing, a mere motion of the wrist, without stirring the foot.

FEIRA, a town of Portugal, in the province of Beria, 10 miles S. of Oporto.

FELAPTON, in logic, one of the six first modes of the third figure of syllogisms; whereof the first proposition is an universal negative, the second an universal affirmative, and the third a particular negative.

FELDKIRCH, or **FELDKIRK**, a county of Germany, formerly in Suabia, now annexed to the Tyrolese. It is bounded on the north by the county of Montfort; east by Pludentz; south by the Grisons; and west by the Rhine.

FELDKIRCH, the capital of the above county, seated on the Ill, near the Rhine, 15 miles E. of Appenzel.

FELDSBERG, a town of Carinthia, belonging to the archbishop of Salzburg, 4 miles N. of Saxenburg.

FELDSBURG, a town of Austria, 28 miles N.N.E. of Vienna, and 32 N.E. of Tulln.

FELICITAS, **FELICITY**, or **HAPPINESS**, was deified by the ancient Pagans. Lucullus built a temple to her. She had another erected by Lepidus. The Greeks worshipped her under the name of **MACARIA**. This deity is often represented upon medals, and generally with a cornucopia in one hand, and a caduceus in the other. The inscriptions are, **FELICITAS TEMPORUM**, **FELICITAS AUGUSTI**, **FELICITAS PUBLICA**, &c.

FELICUDI, one of the Lipari islands, 28 miles W. of Lipari.

FELIS, **CAT**, in zoology, a genus of the class mammalia, order *Feræ*. Front teeth, six; the intermediate ones equal; grinders, three on each side; tongue aculeated backward; claws retractile. The feet are provided with sharp-hooked claws, which are lodged in a sheath, and may be extended or drawn in at pleasure: the head is mostly round, and the visage short. Animals of this genus are ferocious, generally temperate, very agile in climbing trees; alight on their feet when falling from a height. The females bring a considerable number at a birth, and have all eight paps. They dart on their prey with astonishing rapidity, which they eat slowly, growling almost perpetually, as though afraid of losing it: they have little relish for vegetable food. There are twenty-three species, with varieties. The following are the most remarkable. See Plate LXIX.

I. **F. CATUS**, the **COMMON CAT**, inhabits the woods of Europe and Asia, and is domesticated almost every where. Of this species there are many varieties, of which are the following:

1. **F. CATUS ANGORENSIS**, the **ANGORA CAT**, with hair of silvery whiteness and silky texture, and very long, especially about the neck, where it forms a fine ruff. It is a large variety; found about Angora, the same country which produces the fine-haired goat. It degenerates after the first generation in our climate.

2. **F. CATUS AUREUS**, the **LONG-HEADED CAT**, is of a reddish yellow colour, and has a long-shaped head, sharp snout, short legs, with weak claws, and round flat ears. It inhabits New Spain.

3. **F. CATUS CÆRULEUS**, the **BLUE** or **CYPRUS CAT**, is of a blue-grey colour, or greyish black. It is much cultivated in Siberia, on account of its fine fur.

4. **F. CATUS DOMESTICUS**, the **DOMESTIC** or **TAME CAT**, is of a smaller size, and has the hair shorter and thicker than the wild cats. It is an useful, but deceitful, domestic. Although when young they are playful and gay, they possess an innate malice and perverse disposition, which increases as they grow up, and which, from education, they learn to conceal, but never to subdue. Constantly bent upon theft and rapine, though in a domestic state, they are full of cunning and dissimulation; they conceal all their designs; seize every opportunity of stealing, and then fly from

punishment. They easily take on the habits of society, but never its manners; for they have only the appearance of friendship and attachment. This disingenuity of character is betrayed by the obliquity of their movements, and the ambiguity of their looks. In a word, the cat is totally destitute of friendship; he thinks and acts for himself alone. He loves ease, and searches for the softest and warmest places to repose in. The cat is extremely amorous; and which is very singular, the female is more ardent than the male: she not only invites, but searches after and calls upon him to satisfy the fury of her desires; and, if the male disdains or flies from her, she pursues, bites, and in a manner compels him. The cat is incapable of restraint, and consequently of being educated to any extent. However, we are told that the Greeks in the island of Cyprus trained this animal to catch and devour serpents, with which that island was greatly infested. This, however, was not the effect of obedience, but of a general taste for slaughter; for he delights in watching, attacking, and destroying all kinds of weak animals indifferently. He has no delicacy of scent, like the dog; he hunts only by the eye: neither does he properly pursue; he only lies in wait, and attacks animals by surprise; and after he has caught them, he sports with and torments them a long time, and at last kills them (when his belly is full), purely to gratify his sanguinary appetite. The eye of the cat differs greatly from that of most other animals. The pupil is capable of a great degree of contraction and dilatation. It is narrow and contracted like a line during the day, round and wide in the dark. It is from this conformation of the eye that the cat sees best in the night, which gives him a great advantage in discovering and seizing his prey. Although cats live in our houses, they enjoy full liberty; for they never act but according to their own inclination. Besides, a great part of them are half wild; they do not know their masters, and frequent only the barns, out-houses, &c. unless when pressed with hunger. Cats have a natural antipathy at cold and wetness. They likewise hate bad smells; but they are fond of certain aromatics, and particularly of marun, catmint, and valerian. The fur of the cat readily yields electric sparks when rubbed; and if a clean and perfectly dry domestic cat is placed, in frosty weather, on a stool with glass feet, or insulated by any other means, and rubbed for a certain space in contact with the wire of a coated vial, it will be effectually charged by this method.

5. **F. CATUS FERUS**, the **WILD CAT**, is three or four times as large as the house cat; the head larger, and the face flatter. The teeth and claws are tremendous: its muscles very strong, as being formed for rapine: the tail is long and very thick, marked with alternate bark of black or brown, and white, the end always black: the hips and hind part of the lower joints of the leg are black: the fur is very soft and fine. The general colour is a yellowish white, or yellowish brown and whitish, mixed with deep grey or blackish stripes.

II. **F. TIGRINA**, **MARGAY**. The margay is a native of South America, and is about the size of a common cat. The ground-colour is a bright tawny; the face striped downwards with black; the shoulders and body marked both with stripes and large oblong black spots; on the legs the spots are small; the breast, belly, and insides of the limbs, are whitish: the tail is long, and marked with black, grey, and fulvous. It resides principally on trees, preying on birds: it is said to breed in the hollows of trees, and to bring but two young at a birth. It is very fierce and untameable.

III. **F. CONCOLOR**, the **PUMA**, the cougar of Buffon, has a very small head, ears a little pointed, and eyes large. According to some zoologists, the back, neck, rump, and sides, are of a pale brownish red, mixed with dusky hairs; the breast, belly, and inside of the legs, cinereous; the tail is dusky and ferruginous, the tip black; and the teeth are of a vast size. It is as big as a large wolf, being long bodied, and high on its legs; the length from nose to tail five feet three inches; that of the tail two feet eight. This animal inhabits the continent of America, from Canada to Brasil: in South America it is called puma, and by the Europeans is mistaken for the lion. It is the scourge of the colonies of the hotter parts of America, being fierce and ravenous to the highest degree. It swims over the broad rivers, attacks the cattle in the very inclosures, and when pressed with hunger spares not even mankind.

IV. **F. DISCOLOR**, the **BLACK TIGER**, or **COUGUAR NOIR** of Buffon, is covered with short very glossy hairs of a dusky or brownish

brownish black colour; the throat, belly, and inside of the legs, whitish. It grows to the size of a heifer of a year old, and has vast strength in its limbs. It inhabits Brasil and Guiana; and is a cruel and fierce beast, but happily is a scarce species.

V. F. JUBATA, the HUNTING LEOPARD, is of the size of a large greyhound, of a long make, with a narrow chest and long legs. The colour of the body is of a light tawny brown marked with numbers of small round black spots; the neck is shaggy, having a mane four or five inches long; the hair on the belly is of the same length, and the tail is longer than the body. It inhabits India, where it is tamed and trained for the chase of antelopes.

VI. F. LEO, the LION, is principally an inhabitant of Africa, but is also found, though far less plentiful, in the hotter regions of Asia. It is, however, in the interior of Africa that he exerts his greatest ravages, and attains his highest perfection. A lion of the largest size has been found to measure about eight feet from the nose to the tail, and the tail itself about four feet; the general colour is a pale tawny, still paler or more inclining to white beneath; the head is very large, the ears rounded, the face covered with short or close hair, the upper part of the head, the neck, and shoulders, coated with long shaggy hair, forming a pendent mane; on the body the hair is short and smooth; the tail is terminated by a tuft of blackish hair. The lioness, which is smaller than the lion, is destitute of the mane, and is of a whiter cast beneath. The lion, like the tiger, frequently conceals himself in order to spring on his prey, bounding to the distance of a great many feet, and seizing it with his claws. His strength is prodigious: it has been even affirmed, that a single stroke of his paw is sufficient to break the back of a horse; and that he carries off with ease a middle-sized ox or buffalo. He does not often prey in open sunshine, but commences his depredations at the close of day. The roaring of the lion, when in quest of prey, resembles the sound of distant thunder; and, being re-echoed by the rocks and mountains, appals the whole race of animals, and puts them to sudden flight; but he frequently varies his voice into a hideous scream or yell: he is supposed to be destitute of a fine scent, and to hunt by the eye alone. The lion is commonly said to devour as much as will serve him for two or three days, and when satiated with food, to remain in a state of retirement in his den, which he seldom leaves except for the purpose of prowling about for his prey. His teeth are so strong that he breaks the bones with perfect ease, and often swallows them together with the flesh; his tongue, as in other animals of this genus, is furnished with reversed prickles; but they are so large and strong in the lion as to be capable of lacerating the skin. The lioness is said to bring forth in the spring, in the most sequestered places, and to produce but one brood in the year. The young are four or five in number, which the parent nurses with great assiduity, and attends in their first excursions for prey. When brought into Europe lions have been known to breed even in a state of confinement; instances of which are recorded by some of the older naturalists. In the Tower of London also, examples of a similar nature have occurred. The young animals are scarcely so large as small pug dogs, and are said to continue at the teat about the space of a year, and to be five years in coming to maturity. Lions have sometimes constituted a part of the established pomp of royalty in the eastern world. The monarch of Persia, as we are informed by Mr. Bell, in his travels, had, on days of audience, two large lions chained on each side the passages of the hall of state, being led thither, by proper officers, in chains of gold. The Romans, struck with the magnificent appearance of these animals, imported them in vast numbers from Africa, for their public spectacles. Quintus Scævola, according to Pliny, was the first in Rome who exhibited a combat of lions; but Sylla the dictator, during his prætorship, exhibited a hundred lions; and after him Pompey the Great exhibited no less than 600 in the grand circus, viz. 315 males, and the rest females; and Caesar the dictator 400. The Romans, says Mr. Shaw, brought many more lions out of Libya for their public shows, than are now to be found in that country. The lions in Turkey, Persia, and the Indies, are also said to be less numerous than formerly. As this formidable and courageous animal makes a prey of most other animals, and is himself a prey to none, this diminution in the number of the species can be owing to nothing but an increase in the number of mankind: for the strength of this king of beasts is not a match for the dexterity and address of a negro or Hottentot, who will often dare to attack him face to face, and with very slight weapons. The

ingenuity of mankind augments with their number; that of other animals continues always the same. All the noxious animals, as the lion, are reduced to a small number, not only because mankind are become more numerous, but likewise because they have become more ingenious, and have invented weapons which nothing can resist. This superiority in the numbers and industry of mankind, at the same that it has broke the vigour of the lion, seems likewise to have enervated his courage. This quality, though natural, is exalted or lowered according to the good or bad success with which any animal has been accustomed to employ his force. In the vast deserts of Zaara, in those which separate the Negroes and Moors, between Senegal and the boundaries of Mauritania; in those uninhabited regions above the country of the Hottentots; and, in general, all the meridional parts of Africa and Asia, where mankind have disdained to dwell, lions are still as numerous and ferocious as ever. Accustomed to measure their strength by that of all other animals which they encounter, the habit of conquering renders them haughty and intrepid. Having never experienced the strength of man, or the power of his arms, instead of discovering any signs of fear, they disdain and set him at defiance. Wounds irritate, but do not terrify them: they are not even disconcerted at the sight of numbers. A single lion of the desert has been known to attack a whole caravan; and if, after a violent and obstinate engagement, he found himself weakened, he retreats fighting, always keeping his face to the enemy. On the other hand, the lions which live near the villages or huts of the Indians or Africans, being acquainted with man and the force of his arms, are so dastardly as to fly and leave their prey at the sight of women or children. This softening in the temper and disposition of the lion, shews that he is capable of culture, and susceptible, at least to a certain degree, of the impressions that he receives: accordingly, history informs us of lions yoked in triumphal chariots, trained to war, or the chase; and that, faithful to their masters, they never employed their strength or courage but against their enemies. It is certain, that a lion taken young, and brought up among domestic animals, will easily be accustomed to live and sport with them; that he is mild and caressing to his master, especially when he is young; and that, if his natural ferocity sometimes breaks out, it is rarely turned against those who have been kind to him. But, as his passions are impetuous and vehement, it is not to be expected that the impressions of education will at all times be sufficient to balance them: for this reason it is dangerous to let him suffer hunger long, or to vex him by ill-timed teazings: bad treatment not only irritates him, but he remembers it long, and meditates revenge. On the other hand, he is exceedingly grateful, and seldom forgets benefits received. He has been often observed to disdain weak or insignificant enemies, to despise their insults, and to pardon their offensive liberties. When led into captivity, he will discover symptoms of uneasiness, without anger or peevishness: on the contrary, his natural temper softens, he obeys his master, caresses the hand that gives him food, and sometimes gives life to such animals as are thrown to him alive for prey: by this act of generosity he seems to consider himself as for ever bound to protect them; he lives peaceably with them; allows them a part, and sometimes the whole, of his food; and will rather submit to the pangs of hunger, than fill his stomach with the fruit of his beneficence. The lion is not a cruel animal: he kills rather from necessity than choice, never destroying more than he eats; and whenever his appetite is satisfied, he is mild and peaceable. For his ordinary subsistence, he requires about 15 pounds of raw flesh each day. The aspect of the lion corresponds with the noble and generous qualities of his mind. His figure is respectable; his looks are determined; his gait is stately, and his voice tremendous. In a word, the body of the lion appears to be the best model of strength joined to agility. The force of his muscles is expressed by his prodigious leaps and bounds, often 20 feet at once; by the brisk motion of his tail, a single sweep of which is sufficient to throw a man to the ground; by the ease with which he moves the skin of his face, and particularly of his forehead; and, lastly, by the faculty of erecting and agitating the hair of his mane when irritated. See Plate LXIX.

VII. F. LEOPARDALIS, the LESSER LEOPARD of Pennant, resembles the Leopard, but is not half so large; the tail is shorter in proportion to its size, and tapers to a point; it has a large black spot on each side of the upper lip; the back sides and rump are covered with bright yellow hair, marked with small circular com-

pound spots; the face is spotted; the chin white; the breast is marked with small spots, and the belly is white spotted with black. One of this species from the E. Indies, was kept in the tower of London several years ago.

VIII. *F. LEOPARDUS*, the *LEOPARD*, differs from the panther and the ounce, in the beauty of his colour, which is a lively yellow, with smaller spots than those of the two latter, and disposed in groups. He is larger than the ounce, and less than the panther, being about four feet long, and the tail from two to two and a half feet. He inhabits Senegal and Guinea; and spares neither man nor beast. When beasts of chase fail, the leopards descend from the internal parts of Africa in crowds, and make great havoc among the numerous herds that cover the rich meadows of the lower Guinea. It tears its prey to pieces with both claws and teeth; but is always thin, though perpetually devouring. The panther destroys numbers of them.

IX. *F. LYNX CANADENSIS*, the *CANADIAN LYNX*, has pale yellow eyes, and erect ears tufted with long black hair. The body is covered with soft and long fur, cinereous tinged with tawny, or grey mixed with white, and marked with black or dusky spots, more or less visible in different subjects, dependent on the age or season in which the animal is killed: the legs are strong and thick; the claws large. It is about three times the size of a cat; though only about a foot high, and the tail is four inches long, tipped with black. This species inhabits the vast forests of North America. It is called in Canada le chat cervier, or le loup cervier, on account of its being so destructive to deer; which it drops on from the trees, like the puma, and, fixing on the jugular vein, never quits its hold till the exhausted animal falls through loss of blood. The English call it a wild cat. It is very destructive to the young pigs, poultry, and all kind of game. The skins are in high esteem for the softness and warmth of the fur; and great numbers are annually imported into Europe.

X. *F. LYNX CHAUS*, the *CASPIAN LYNX*, has a round head, a little more oblong than that of the common cat; shining restless eyes, with a most brilliant golden pupil; ears erect, oval, and lined with white hairs; their outside reddish, their summits tufted with black. The hairs are coarser than those of the cat or common lynx, but less so than those of the wolf. They are shortest on the head, but on the top of the back above two inches long. The colour of the head and body is a yellowish brown; the breast and belly of a bright brown nearly orange. The tail reaches only to the flexure of the leg; is thick and cylindric; of the same colour with the back, tipped with black, and thrice obscurely annulated with black near the end. In general appearance it has the form of the domestic cat.

XI. *F. LYNX VULGARIS*, the *COMMON LYNX*, is about two feet and a half long, and 15 inches high. He has a great resemblance to the common cat; but his ears are longer and tufted, and his tail much shorter: his head and body are of a greyish colour tinged with red; his hair is streaked with yellow, white, and black, colours. The lynx inhabits the vast forests of the north of Europe, Asia, America, and Japan. His eyes are brilliant, his aspect is soft, and his air is gay and sprightly. Like the cat, he covers his urine with earth; he howls something like the wolf, and is heard at a considerable distance; he does not run like the dog or wolf, but walks and leaps like a cat; he pursues his prey even to the tops of trees; neither wild eats nor squirrels can escape him; he lies in wait for stags, goats, hares, weasels, birds, &c. and darts suddenly upon them; he seizes them by the throat and sucks their blood, then opens the head and eats the brain; after this, he frequently leaves them and goes in search of fresh prey. The colour of his skin changes according to the season or the climate; the winter furs are more beautiful than those of summer. These furs are valuable for their softness and warmth: numbers are annually imported from North America, and the north of Europe and Asia; the farther north and east they are taken, the whiter they are, and the more distinct the spots.

XII. *F. ONCA*, *AMERICAN TIGER*, the *JAGUAR* of Buffon, is of a bright tawny colour; the top of the back marked with long stripes of black; the sides with rows of eye like annular spots, open in the middle, which is of the ground colour of the hair: the thighs and legs are marked with full spots of black, the breast and belly whitish; the tail is half the length of the body. This species, which grows to the size of a wolf, and even larger, inhabits the hottest parts of South America, from the isthmus of Darien to

Buenos Ayres. It is fierce, and destructive to man and beast. Like the tiger, it plunges its head into the body of its prey, and sucks out the blood before it devours it. It makes a great noise in the night, like the howling of a hungry dog; and is very cowardly. It is easily put to flight, either by the shepherds' dogs, or by a lighted torch, being very fearful of fire. It lies in ambush near the sides of rivers; and there is sometimes seen a singular combat between this animal and the crocodile. When the jaguar comes to drink, the crocodile, ready to surprise any animal that approaches, raises its head out of the water: upon which the former instantly strikes its claws into the eyes of this dreadful reptile, the only penetrable part, who immediately dives under the water, pulling his enemy along with it, where they commonly both perish.

XIII. *F. PARDALIS*, the *MEXICAN PANTHER*, or *OCELOT* of Buffon, has its head, back, upper part of the rump, and tail, of a bright tawny; a black stripe extending along the top of the back, from head to tail; and from the nostrils to the corners of the eyes, there also runs a stripe of black; the sides are whitish, marked lengthways with long stripes of black, hollow and tawny in the middle, in which are sprinkled some small black spots; the legs are whitish, varied with small black spots; and the tail is also varied with small spots near its base, and larger near the end, which is black. It is above four times the size of a large cat, and strongly made. It inhabits Mexico, California, the neighbourhood of Carthagen, and Brasil.

XIV. *F. PARDUS*, the *PANTHER*, is about the size of a large dog, and has a great resemblance to a domestic cat. The tongue is rough, and remarkably red; the teeth are strong and sharp; the skin is exceedingly beautiful, being of a yellow or bright tawny colour, variegated with roundish black spots, and the hair is short. Each spot is composed of four or five small spots, with a single spot in the centre. He has a cruel and ferocious aspect; his motions are brisk and lively; his cry resembles the growl of an enraged dog, but is more strong and rough. The panther inhabits Africa, from Barbary to the remotest parts of Guinea. The species is next in size to the tiger; next to it in cruelty, and in its general enmity to the animal creation: it is to Africa what the former is to Asia, with this alleviation, that it prefers the flesh of brutes to that of mankind; but when pressed with hunger, attacks every living creature without distinction.

XV. *F. SERVAL*, the *SERVAL*, has the upper part of the body of a dusky brown, interspersed with round black spots; the belly and the orbits of the eyes are white. This animal, which is very fierce and untameable, inhabits the woods in the mountainous parts of India and Thibet; where it lives in trees, and breeds in them. It scarcely ever descends on the ground; but leaps with great agility from tree to tree.

XVI. *F. TIGRIS*, the *TIGER*, according to some authors, is larger, and, according to others, somewhat less, than the lion. M. de la Landemagon assures us, that he has seen a tiger in the East Indies fifteen feet long, including undoubtedly the length of the tail, which, supposing it to be four feet, makes the body of the tiger about eleven feet in length. The skeleton preserved in the late royal academy at Paris, indicates that the animal was about seven feet long from the point of the muzzle to the origin of the tail; but then it must be considered that he was caught young, and lived all his days in confinement. The head of the tiger is large and roundish; and the ears are short, and at a great distance from each other. The form of the body has a great resemblance to that of the panther. The skin is of a darkish yellow colour, striped with long black streaks; the hair is short, excepting on the sides of the head, where it is about four inches long. The point of the tail is black, and the rest of it is interspersed with black rings. His legs and claws resemble those of a lion, only the legs are much shorter in proportion to the size of the animal. The tiger is more ferocious and savage than the lion. Although gorged with carnage, his thirst for blood is not appeased; he seizes and tears in pieces a new prey with equal fury and rapacity, the very moment after devouring a former one; he lays waste the country he inhabits; he neither dreads the aspect nor the weapons of men; slaughters whole troops of domestic animals; and attacks young elephants, rhinoceroses, &c. and sometimes even braves the lion himself. The tiger seems to have no other instinct, but a constant thirst after blood, a blind fury which knows no bounds or distinction, and which often stimulates him to devour his own young, and to

tear

tear the mother in pieces for endeavouring to defend them. He lies in wait on the banks of rivers, &c. where the heat of the climate obliges other animals to repair for drink. Here he seizes his prey, or rather multiplies his massacres; for he no sooner kills one animal than he flies with equal fury upon the next, plunges his head into their bodies, and drinks their blood. However, when he kills a large animal, as a horse or buffalo, he sometimes does not tear out the entrails on the spot, but, to prevent any interruption, drags off the whole carcass to the wood, with incredible swiftness. This is a sufficient specimen of the strength of this rapacious animal. Neither force, restraint, nor violence, can tame the tiger. He is equally irritated with good as with bad treatment: he tears the hand which nourishes him with equal fury, as that which administers blows: he roars and is enraged at the sight of every living creature. Almost every natural historian agrees in this horrible character of him. There is a sort of cruelty in his devastations, unknown to the generous lion; as well as a cowardliness in his sudden retreat on any disappointment. "I was informed (says Mr. Pennant) by very good authority, that in the beginning of this century, some gentlemen and ladies, being on a party of pleasure, under a shade of trees, on the banks of a river in Bengal, observed a tiger preparing for its fatal spring: one of the ladies, with amazing presence of mind, laid hold of an umbrella, and furlled it full in the animal's face, which instantly retired, and gave the company an opportunity of removing from so terrible a neighbour.

XVII. F. UNCIA, the OUNCE, is less than the panther; the tail is longer; the hair is likewise longer, and of a whitish grey colour, marked with irregular black spots. The ounce is easily tamed; and is employed in hunting in several parts of Asia, where dogs are very scarce. He has not the delicate scent of a dog; does not trace other animals by the smell: neither can he run them down in a fair chase; but lies in wait for their approach, and then darts upon them unawares. He leaps so nimbly, that he easily clears a ditch or a wall several feet high; besides, he often climbs trees, waits till some animal passes, and instantly leaps upon them. This method of catching their prey, is practised by the panther and leopard, as well as by the ounce. The ounce inhabits Barbary, Persia, Hyrcania, and China. It is under as much command as a setting-dog; returns at the least call, and jumps up behind its master. This animal is supposed to be the *Παυδαλις*; *μυωταρος*, or lesser panther of Oppian, and the panther of Pliny.

FELIU DE QUIXOLO, a port of Spain in Catalonia, on the sea-coast, 21 miles S. of Gerona.

FELIX, Str. an island in the Pacific Ocean, N. N. W. of Juan Fernandez.

FELL, DR. JOHN, a very learned English divine who entered a student at Christ church at Oxford in 1636. In 1648, he was ejected by the parliamentary visitors, being then in orders; and from that time to the restoration lived at Oxford a retired and studious life. He was installed canon of Christ church, in July 1660; and dean in 1661; in which places he did great services to the college, and reformed several abuses. He was consecrated bishop of Oxford in 1675; and had leave to hold his deanry in commendam, that he might continue his services to the college and university. He published several works, and died in 1686.

FELLA, CAPE, a cape of Naples, on the W. coast of Calabria Citra.

FELLEN, a town of Livonia, S. E. of Revel. Lon. 24. 5. E. Lat. 58. 22. N.

FELLEIN, a town of France, in the department of Creuse, and late province of Marche, 21 miles S. S. E. of Gueret.

FELLOWSHIP, or COMPANY, in arithmetic, is when two or more join their stocks, and trade together, dividing their gain, or loss, proportionably. See ARITHMETIC.

FELO DE SE, in law, one who is felon of himself; i. e. being of sound memory, and of the age of discretion, or 14 years, kills himself. A felo de se forfeits all chattels real and personal, which he has in his own right; and also all such chattels real whereof he is possessed, either jointly with his wife, or in her right; and also all bonds and other personal things in action, belonging solely to himself; and also all personal things in action, and entire chattels in possession, to which he was entitled jointly with another, on any account, except that of merchandize; but it is said that he shall forfeit a moiety only of such joint chattels as may be severed, and nothing at all of what he was possessed of as executor or administrator. Stamford. P. C. 183, 189. Plow. 243, 262. 3 Inst. 55.

FELONY, a crime denounced capital by the law. Felony (says Judge Blackstone,) in the general acceptation of the law, comprises every species of crime, which occasions at common law the forfeiture of lands or goods. This most frequently happens in those crimes for which a capital punishment either is or was to be inflicted: for those felonies that are called clergyable, or to which the benefit of clergy extends, were anciently punished with death in all lay, or unlearned, offenders; though now, by the statute law, that punishment is for the first offence universally remitted. Treason itself, says Sir Edward Coke, was anciently comprised under the name of felony; and in confirmation of this we may observe, that the statute of treasons, 25 Edw. III. c. 2, speaking of some dubious crimes, directs a reference to parliament; that it may there be judged, "whether they be treason or other felony." All treasons, therefore, strictly speaking, are felonies; though all felonies are not treason. And all offences, now capital, are in some degree or other felony: but this is likewise the case with some other offences which are not punished with death; as suicide, where the party is already dead; homicide by chance-medley, or in self-defence; and petit larceny, or pilfering; all which are (strictly speaking) felonies, as they subject the committers of them to forfeitures. So that, upon the whole, the only adequate definition of felony seems to be, an offence which occasions a total forfeiture of either lands or goods, or both, at the common law; and to which capital or other punishment may be superadded, according to the degree of guilt. To explain this farther: the word felony, or felonía, is of undoubted feudal original, being frequently to be met with in the book of feuds, &c. but the derivation of it has much puzzled the juridical lexicographers, Prataeus, Calvinus, and the rest: some deriving it from the Greek, *φύλος*, an impostor or deceiver; others from the Latin, *fallo*, *fefelli*, to countenance whence they would have it called felonía. Sir Edward Coke has given us a still stranger etymology; that it is crimen animo felleo perpetratum, "with a bitter or a gallish inclination." But all of them agree in the description; that it is such a crime as works a forfeiture of all the offender's lands or goods. And this gives a great probability to Sir Henry Spelman's Teutonic or German derivation of it: in which language indeed, as the word is clearly of feudal original, we ought rather to look for its signification, than among the Greeks and Romans. Felon then, according to him, is derived from two northern words; *fee*, which signifies the fief, feud, or beneficiary estate; and *lon*, which signifies price or value. Felony is therefore the same as pretium feudi, the consideration for which a man gives up his fief; as we say in common speech, such an act is as much as your life, or estate, is worth. In this sense it will clearly signify the feudal forfeiture, or act by which an estate is forfeited, or escheats, to the lord. To confirm this, we may observe, that it is in this sense, of forfeiture to the lord, that the feudal writers constantly use it. Felony may be without inflicting capital punishment as in the cases instanced of self-murder, excusable homicide, petit larceny; and it is possible that capital punishments may be inflicted, and yet the offence be no felony; as in case of heresy by the common law, which, though capital, never worked any forfeiture of lands or goods, an inseparable incident to felony. And of the same nature was the punishment of standing mute, without pleading to an indictment; which at the common law was capital, but without any forfeiture, therefore such standing mute was no felony. In short, the true criterion of felony is forfeiture: for, as Sir Edward Coke justly observes, in all felonies which are punishable with death, the offender loses all his lands in fee simple, and also his goods and chattels; in such as are not punishable, his goods and chattels only. The idea of felony is indeed so generally connected with that of capital punishment, that we find it hard to separate them; and to this usage the interpretations of the law do now conform. And therefore, if a statute makes any new offence felony, the law implies that it shall be punished with death, viz. by hanging as well as with forfeiture: unless the offender prays the benefit of clergy; which all felons are entitled once to have, unless the same is expressly taken away by statute. Felonies by statute are very numerous; they are set forth in alphabetical order in the Table of the 4to. edition of the Statutes.

FELT, a kind of stuff, which derives its consistence merely from being fulled or wrought with lees and size, without being either spun or woven. The mechanism of felting is equally simple and curious; though its theory is little understood, even by professional

professional hatters. As the surface of hair and wool is by no means smooth, but formed either of plates resembling the scales of fish, or of zones placed over each other, as we find in the structure of horns, it follows that hair or wool, when promiscuously entangled, cannot be easily disengaged, on account of its rough sides, which may be readily perceived, by drawing a hair between the fingers against the root-end. Thus, each inequality of surface accommodates itself to that of another hair, and forms at length a natural texture. Felt is made either of wool alone, or of a mixture of that article with camel's or other hair, and is used principally in the manufacturing of hats.

FELTRI, a town of Austria, capital of the Feltrin, 38 miles N. of Padua. Lon. 11. 55. E. Lat. 46. 3. N.

FELTRIA, in ancient geography, a town on the borders of Rætia towards Italy; now called Feltri.

FELTRIN, or **FELTRINO**, a mountainous district of Maritime Austria, in the Trevisan, at the foot of the Alps, 28 miles long and 10 broad.

FELUCCAS, [*felleu*, Fr. *felkon*, Arab.] small open boats with six oars; they are common in the Mediterranean, and have this peculiarity, that the helm may be applied either in the head or stern, as occasion requires.

FEMEREN, or **FEMERN**, a fertile island of Denmark, in the Baltic, three miles from the coast of Holstein; containing the town of Burg, and several villages. Lon. 11. 5. E. Lat. 54. 30. N.

FEMINEUS FLOS, a female flower. Linnaeus thus denominates a flower which is furnished with the pistillum, or female organ of generation, but wants the stamina or male organ. Female flowers may be produced apart from the male, either on the same root, or on distinct plants. The birch and mulberry are examples of the first case; willow and poplar of the second. See **BOTANY**.

FEMININE, in grammar, one of the genders of nouns. See **GENDER**. The feminine gender is that which denotes the noun or name to belong to a female.

FEMME COVERTE, in law, a married woman. See **COVERTURE**.

FEMME SOLE, an unmarried woman, whose debts, contracted before marriage, become those of her husband after it. A femme sole merchant, is where a woman, in London, uses a trade alone, without her husband, on which account she shall be charged without him.

FEMOE, a small island of Denmark between Zealand and Laland. Lon. 11. 32. E. Lat. 55. 1. N.

FEMORIS Os, the thigh bone. See **ANATOMY**.

FEMUR, the thigh. See **ANATOMY**.

FEN, a place overflowed with water, or abounding with bogs; the term is also applied to such boggy lands as are naturally disposed to produce coarse vegetables from the retention of water. In many parts of the kingdom since the introduction of a laudable spirit of improvement in agriculture, much valuable land has been redeemed both in England and Ireland from bogs and fens. Several statutes have been made for the draining of fens, chiefly in Kent, Cambridgeshire, Bedfordshire, and Lincolnshire; and by an act, 11 Geo. II. commissioners shall be appointed for the effectual draining and preserving of the fens in the isle of Ely, who are authorised to make drains, dams, and proper works thereon; and they may charge the landholders therein with a yearly acre-tax, and, in default of payment, sell the defender's lands. The fens in Lincolnshire and elsewhere in England, bring many advantages to the inhabitants. Fowls and fish are very plentiful in them. The pikes and eels are large and easily caught, but they are usually coarse. Ducks, mallards, and teals, are in such plenty as is scarce to be conceived. They are taken by decoys in prodigious flocks at a time, and sent to London market twice a week during the season.

FENCE, in gardening and husbandry, a wall, ditch, bank, or other inclosure, made round gardens, fields, woods, &c. In hot climates, where they have no occasion for walls to ripen their fruit, their gardens lie open, where they can have a water fence, and prospects; or else they are bounded with groves, which are much more pleasing to the sight than dead walls; but, in cold countries, we are obliged to have walls to shelter and ripen our fruit, although they take away much from the pleasant prospect of the garden. Brick walls are accounted the best and warmest for fruit; and these being built pannelwise, with pillars at equal dis-

tances, save a great deal of expence, as they can be built thinner than if they were made plain without the pannels; and, besides, these pannels, make the walls look the handsomer. Stone walls, however, on account of their durability, are to be preferred to brick, especially those of square hewn stones. Those that are made of rough stones, though they are very dry and warm, yet, by their unevenness, are inconvenient to nail up trees to, unless pieces of timber be laid in them here and there for that purpose. But, in large gardens, it is better to have the prospect open to the pleasure garden; which should be surrounded with a fosse, that from the garden the adjacent country may be viewed. Where the fosses are made round a garden situated in a park, they are extremely proper; because hereby the prospect of the park will be obtained in the garden, which renders those gardens much more agreeable than those that are confined. In places where there are no good prospects to be obtained from a garden, it is common to make the inclosure of park-paling; which, if well performed, will last many years, and has a much better appearance than a wall: and this pale may be hid from the sight within, by plantations of shrubs and evergreens; or there may be a quick hedge planted within the pale, which may be trained up, so as to be an excellent fence by the time the pales begin to decay. Fences round parks are generally of paling; which, if well made of winter fallen oak, will last many years. But a principal thing to be observed, is not to make them too heavy, else their own weight will cause them to decay: therefore the pales should be cleft thin; and the rails should be cut triangular, to prevent the wet lodging upon them; and the posts should be good, and not placed too far asunder. One of these pales will thus last upwards of forty years. Dr. Anderson, in his "Essays on Agriculture, &c." observes, that, "The fences that are most universally employed, are either stone dikes or hedges. Dikes, if well built, as effectually preserve a field from the intrusion of domestic animals, as any other kind of fence whatever; but they afford little warmth or shelter to the fields: whereas hedges, if good, answer both these purposes equally well. But the most material distinction between dikes and hedges is, that dikes are in their highest degree of perfection as soon as they are reared, and from that moment begin to tend towards decay; so that the person who builds this kind of fence immediately receives the full benefit thereof: whereas hedges, being at first weak and tender, stand in need of attention and care, and do not become a fence for several years after they are planted; and, as they continue to increase in strength, and gradually acquire a higher and higher degree of perfection, it is long before they begin to fall towards decay; so that they are, in general, infinitely more durable than dikes, although they are longer in becoming of use to the person who plants them. Which of these two kinds of fences may, upon the whole, be most eligible, must, in general, be determined by the circumstances and views of the possessor of the ground to be inclosed. Various kinds of plants have been recommended for constructing the common fences, of which we shall point out the principal: 1. The White-Thorn is the most proper for fences, as it grows quickly, is very durable, and makes a very handsome appearance. It thrives on any soil, where a ditch and a new bank are prepared for its reception, unless the soil consist entirely of sand or gravel: it will nevertheless grow even in such situations, if the planting be succeeded by heavy rains. 2. Black-Thorn is another excellent shrub for a fence: it is, however, much inferior to the white-thorn, as its growth is not so certain; and, where it thrives, its roots spread, and are apt to run in too much upon the land. For dead hedges and mending open places, the bushes of this plant are superior even to the white-thorn; they are likewise less liable to be cropped by cattle. 3. The Holly, which is indeed preferable to either of the plants above-mentioned; for, though its growth is slower, and more uncertain, yet where it succeeds, it amply compensates for the delay and expence incurred, by its thickness, height, and strength. The best mode of making a fence with these trees is, to plant them with the quick or white-thorn, in the proportion of one of the former to four of the latter. Both will flourish; and, as the hollies increase in size, the white-thorns may be pulled up: so that when the trees have attained their full growth, they will require the whole of the space occupied by the thorns, and will make a most durable fence. If any vacancies should intervene, they may be easily closed, by bending down, and covering the lower branches with earth: thus, they will shoot forth.

forth in the ensuing year, and form a barrier impenetrable to cattle. Beside these, alder, and even elder, make, in certain situations, excellent fences. If sticks or truncheons of the latter, from ten to twelve feet in length, be set in a sloping direction each way, so as to form a kind of chequer-work, they will grow speedily, and continue for several years. This plant is excellently adapted to watery places, as its lowest roots are continually spreading, and thus prevent the banks on which they stand, from being undermined, or washed away by the current. The last tree which we shall mention is the Horn-Beam. It is chiefly used in Germany for the purpose of fencing lands; and is propagated from sets or slips, which are planted on a parapet of earth, with a ditch on each side, in such a direction that every two plants may intersect each other. The bark is then scraped off the place where they meet, and which is covered with bands of straw: in consequence of this operation, the two plants become conjoined, and put forth horizontal slanting shoots, forming a kind of palisade; which, if lopped annually, will render every part of the fence equally impenetrable to men and cattle.

FENCE-MONTH, the month wherein deer begin to fawn, during which it is unlawful to hunt in the forest. It commences 15 days before midsummer, and ends 15 days after it. This month, by ancient foresters, is called defence-month.

FENCING, the art of making a proper use of the sword, either for attacking an enemy, or defending one's self. This art is acquired by practising with foils, called in Latin *rudes*: whence fencing is also denominated *gladiatura rudaria*. It is one of the exercises learnt in the academies. Pyrrard assures us, that the art of fencing is so highly esteemed in the East Indies, that none but princes and noblemen are allowed to teach it. They wear a badge or cognizance on their right arms, called in their language *esaru*; which is put on with great ceremony, like the badges of our orders of knighthood, by the kings themselves. Fencing is divided into two parts, simple and compound.

1. **FENCING, COMPOUND**, includes all the possible arts and inventions to deceive the enemy, and make him leave that part, we have a design on, bare and unguarded, upon finding we cannot come at it by force, nor by the agility of the simple play. The principal means hereof are, on the offensive side, feints, appeals, clashings, and entanglings of swords, half thrusts, &c.; and, on the defensive, to push in parrying. Of these a detail would be here useless, as they are only to be understood and acquired from personal instructions conjoined with practice.

2. **FENCING, SIMPLE**, is performed directly and nimbly, on the same line; and is either offensive or defensive. The principal object of the first, is whatever may be attempted, in pushing or making passes, from this or that point, to the most uncovered part of the enemy. The second consists in parrying and repelling the thrusts aimed by the enemy.

FEN-CRICKET. See **GRYLLUS**.

FENELON, FRANCIS DE SALIGNAC DE LA MOTTE, was of an ancient and illustrious family, and born at the castle of Fene-Jon in Perigord, in 1651. In 1689, he was appointed tutor to the dukes of Burgundy and Anjou; and, in 1695 was consecrated Archbishop of Cambray. After this, a storm rose against him, that obliged him to leave the court for ever, occasioned by his work entitled, "An Explication of the Maxims of the Saints concerning the Interior Life;" in which he seemed to favour the extravagant notions of Madam Guyon, and the principles of Quietism. A controversy on this occasion was for some time carried on between him and M. Bossuet, bishop of Meaux; which terminated in an appeal to the pope, who condemned the book, March 12th, 1699. Some allege that there was more of court policy than religious zeal in this affair; but be this as it may, the archbishop submitted patiently, and retiring to his diocese, performed the duties of his station, and led a most exemplary life. The work that gained him the greatest reputation, and which will render his memory immortal, is his "Adventures of Telemachus;" the style of which is natural, the fictions well contrived, the moral sublime, and the political maxims tending all to the happiness of mankind. Hence it is thought, as the printing of this work was stopped at Paris, that the prelate's heresy was rather in politics than religion; and though his disgrace was prior to this work, he had, while he was tutor to the young princes, taught them the same principles asserted and exemplified in Telemachus.

Fenelon died in 1715; and a collection of all his religious works was afterwards printed at Rotterdam, under the care of the Marquis Fenelon his grand nephew, when ambassador to the States-General.

FENERI, the capital of Chiampa.

FENESTRELLE, a town of Piedmont, in the Vaudois, 18 miles W. of Turin.

FENNEL, in botany. See **ANETHUM**.

FENNEL FLOWER. See **NIGELLA**.

FENUGREEK. See **TRIGONELLA**.

FEOD, or **FEUD**, is defined to be a right which a vassal hath in lands or some immovable thing of his lord's, to use the same, and take the profits thereof hereditarily, rendering unto the lord such feudal duties and services as belong to military tenure, &c. and the property of the soil always remaining to the lord. Pontoppidan says, that *odh* in the northern languages is the same word with *proprietas*, and all with *totum* in the Latin: hence, *odhall* signifies right; and hence we may conjecture, that the udal right in Finland is derived. By transposing these two syllables, we form the word *allodh*; whence we have the etymology of the *allodium* or absolute property claimed by the holders of fiefs or feuds; and combining *odh*, signifying property, with the word *fee*, signifying, a conditional stipend or reward, we have the word *feodh*, signifying, a property given by way of stipend or reward upon a certain condition." See **FEODAL SYSTEM**.

FEODAL SYSTEM, the constitution of Fiefs or Feuds. About 12 centuries ago, this system was so universally received in Europe, that Sir Henry Spelman calls it "the law of nations in our western world." Hence it deserves our attention in a particular manner; a knowledge of the different feuds being indispensably requisite for a proper understanding either of the civil government of our own country, or the laws by which its landed property is regulated. The military policy of the Celtic or northern nations, known by the names of Goths, Vandals, Franks, Huns, and Lombards, furnished the original constitution or system of feuds. These people pouring out in vast multitudes from the same officina gentium, or store-house of nations, over-ran all the European countries on the declension of the Roman empire. They brought the feudal system along with them from the countries out of which they emigrated; and, supposing it to be the most proper method of securing their new conquests, they introduced it into their more southerly colonies. According to this system, the victorious general allotted considerable tracts of land to his principal officers; while they, in like manner divided their possessions among the inferior officers, and the common soldiers who were thought to be the most deserving. Allotments of this kind were named *feoda*, fiefs, fees, or feuds, from a combination of words, in the language of these barbarians, signifying a reward or stipend bestowed on certain conditions. The condition upon which these rewards were given was, that the possessors should faithfully serve the person from whom they were received, both at home and abroad, in the military way. To this they engaged themselves by a *juramentum fidelitatis*, or oath of fealty, in the event of a breach of which, either by not performing the service agreed upon, or by deserting their lord in time of battle, &c. the lands were to return to their original possessor. The possessors of feudal allotments thus became interested in the defence of them; and not only the receivers, but those who gave them, were equally and mutually bound to defend their possessions, none of them being able to pretend any right but that of conquest. For this purpose, government and subordination were absolutely necessary; it being impossible to conduct any system of defence where every thing was tumultuous and irregular. Every person, therefore, who was a feudatory, *i. e.* who had received lands, was bound to do every thing in his power to defend the lord of his fee; while, on the other hand, the latter was no less subordinate to his immediate superior; and so up to the prince himself. In like manner a reciprocal bond of defence existed down from the prince to the lowest feudists. Such were the foundations on which the feudal system was properly established: and the natural consequence was, a military subjection throughout the whole community. The prince could always collect an army of feudatories ready to defend not only the kingdom in general, but the particular possessions of each person; and the propriety of this constitution was soon apparent in the strength which these newly erected kingdoms acquired,

ed, and the valour with which their conquests were defended. Besides these feudal grants, however, which were held only on the terms of military service above mentioned, there were others called allodial, which were given upon more enlarged principles. To these every freeman had a title; and could not only claim his territory as well as the rest, but dispose of it at his pleasure; and this freedom was denominated allodality. These allodials, however, were not exempted from military service. A part of their freedom consisted in liberty to go to the wars; for this, in the barbarous times we speak of, was the only way to acquire any degree of renown. Only the slaves were destined to follow the arts of peace; while every free person was not only at liberty to defend his country, but under an obligation to do it in case of any urgent necessity. Thus there was a feudal and a national militia. The free people only were allowed to possess property; the feudal vassals constituted the army, properly so called; while the national militia was composed of the allodial proprietors. This allodality, however, was not confined to landed property, but included likewise moveable estates or money; so that proprietors of the latter kind were obliged also in times of danger to bear arms and appear in the field. Between the feudal and allodial proprietors, however, there was this farther difference, that the latter had no concern with any private quarrels which might take place among the lords themselves; so that they were never obliged to appear in the field unless when called forth by the sovereign against the enemies of the nation at large. This circumstance we might suppose to be an advantage, but it ultimately operated otherwise; becoming the means of changing the allodial right into a feudal tenure. For some time the holders of fiefs had an eminent advantage over the allodial proprietors. This was owing to the imperfection of government in those days: so that the nobles had it in their power to revenge their own quarrels, while the weak were equally exposed to the insults of both parties. The lord and his vassals therefore were always formidable; but the allodial proprietors had scarce any means of defending themselves. The reasons of this were, 1st, that the law did not allow them to commit any hostilities; and 2dly, they were too distant and unconnected to form any proper league for mutual defence; and hence proceeded the necessity of converting allodial property into feudal tenure. This was indeed owing in a great measure to the absurdity and violence of the times, by which gifts of property, burthened with service, and which might return to the person who granted them, were rendered superior in value to the absolute and unconditional possession of a subject. Other considerations likewise contributed to produce the same effect. As in those dark ages no right existed but what had its origin in conquest, it thence followed, that the greatest conqueror was the most honourable person. The king, in whom the whole exploits of the community centred, as being their head, was the most honourable person; all others derived from him that portion of honour which they enjoyed, and which was most nicely adjusted in proportion as they approached him. Allodial proprietors therefore having no pretensions of this kind, were treated with contempt as a kind of poltroons. From this disagreeable situation they wished to free themselves; by converting their allodial property into feudal tenures; while the princes, supposing it their interest to extend those tenures as much as possible, discouraged the allodial possessions. As the feudists supported the importance of the nation and dignity of the monarch, it was not thought proper to allow the allodial proprietors any greater compensations than what were given to vassals in similar cases. Thus they were exposed to continual mortifications in the courts of justice; they were neglected by the king; denied sufficient protection from the laws; exposed not only to continual insults, but to have their property on all occasions destroyed by the great; so that they were without resource except from the feudal tenures, and were obliged even to solicit the privileges, which were bestowed in other cases on vassals. In these unhappy circumstances, they were glad to yield up their lands to any superior whom they thought most agreeable, and to receive them back from him as a feudal gift. Thus the landed property was every where changed into feudal tenures, and fiefs became universal. See FEOD, FIEF, and TENURE. For some time the feudal system was not only useful in itself, but honourable in its principles; but this continued no longer than while the importers of it into Europe adhered to their original simple and noble maxims. During that period, the

lord exercised his bounty to the vassal, which the latter repaid by acts of gratitude: so that the intercourse betwixt them was of the most affectionate kind; and this gave rise to what are called the Feodal Incidents. The expectants of fiefs were educated in the hall of the superior, while the tenures were precarious, or only for life: and even when they became hereditary, the lord took care of the son and estate of his deceased vassal; not only protecting his person, but taking charge of his education, and directing the management of his affairs. He took pleasure in observing his approach to maturity; and when he came of age, never failed to deliver to him the lands, with the care of which had he been entrusted, and which he had been careful to improve. This was called the incident of wardship. The incident of relief was founded upon the gratitude of the vassal; who, upon entering on his fief, brought a present to his lord, as an acknowledgment of his care of him during the early part of his life, and in order to conciliate his future regard. The incident of marriage proceeded also upon the principle of gratitude on the part of the vassal. The latter, conscious of the favours he had received, did not choose to ally himself with a family inimical to his chief: while the superior himself, ambitious to aggrandise and augment the importance of his family, sought the most advantageous match for his vassal. Sometimes the superior himself was reduced in his circumstances by war or other accidents: but from whatever cause his distress proceeded, even though it had arisen from his own extravagance or prodigality, or when only destitute of means to support his ambition or grandeur, his vassals were bound to support and relieve him according to their circumstances; and this was called the incident of aid. The incident of escheat took place on the part of the vassal, when, through cowardice, treachery, or any remarkable misbehaviour, he rendered himself unworthy of his fief. In that case, the taking of it from him, and giving it to one more worthy, was called an escheat. While the lords and vassals thus vied with one another in mutual acts of friendship and benevolence, universal happiness, liberty, and activity, were diffused through the society. The vassals behaved courteously towards the retainers, who were immediately below them; while they again were courted by the lords as constituting their importance and strength; the lords, lastly, giving a like importance and dignity to the sovereign himself. Thus a regular, powerful, and compact system of government took place; an unanimity and attention pervaded the various departments of state; so that while the subjects were free, the nation at large was formidable. During this happy state of affairs, the members of the national assembly in every country in Europe appeared there in arms, whether they came personally, or by their representatives. Such particularly was the case under the Anglo-Saxon government; and the happiness they at that time enjoyed made the oppression and tyranny of the Normans appear the more intolerable. In process of time, the state of society began to suffer a remarkable alteration. The high and disinterested notions, from which the happiness above mentioned, took its origin, declined; the romantic ideas of chivalry ceased; and much more interested notions of property came in their stead. The separation of the interest of the lords from their vassals was the first step towards the destruction of the feudal system. Thus the incidents, which had hitherto promoted their happiness, now did the very reverse. Property being looked upon as a distinction superior to personal merit, introduced the most mercenary views. In consequence of these, the infant ward, the care of whom was wont to be considered as a sacred and honorary trust, was now only looked upon as a mean of procuring emolument to the superior. The latter regarded the profits of his vassals as so many diminutions of his own wealth. Instead of taking care to improve the state of his ward as formerly, he impoverished it; not only neglecting the education of the heir, but offering insults to himself; inasmuch that the relations of the unfortunate vassal were often obliged to ransom from the avaricious superior both his person and effects. By merchandise of this kind the coffers of princes were filled, and wardships let out to strangers, who might exercise their rapacity with greater freedom. When the vassal at last attained the years of maturity, he came to the possession of his lands without any of that joy and festivity which usually took place on the occasion. He received an inheritance wasted and impoverished, while new grievances daily presented, to augment the horrors of his situation. All the incidents, which formerly were so many expressions of gratitude

gratitude on the part of the vassal, were now changed into taxes exacted at the pleasure of the lord. Before the vassal was invested in his land, the superior exacted from him a certain sum or gift, to be measured only by his own rapacity; and in case of delay or inability to pay this demand, the superior continued in possession of the estate. Such scandalous oppression could not but produce the greatest discontent and clamour. Applications were made to the law without success; nor were even the laws regarded which were fabricated on purpose for their relief. The incident of marriage now proved a source of the most dreadful oppression. The lord assumed a right of marrying his vassal to whom he pleased; and he not only exerted this right himself, but would sell it to a stranger, or allow the vassal to buy it himself; while the penalty annexed to a marriage without the consent of the superior involved no less punishment than the loss of the estate itself, or some such grievous infliction as for a crime of the first magnitude. The case was still worse with a female ward; whose beauty and accomplishments became a source of gain to the superior, or were sacrificed to please his whim or caprice; so that her relations were frequently obliged to buy from him the privilege of marrying her to the person she or they thought most proper. In like manner the aid, which was formerly a voluntary gift from the vassal in cases of distress happening to his lord, now became an unavoidable tax. An aid formerly was demanded when the superior's eldest daughter was married, when his eldest son was knighted, or when he himself was taken prisoner in battle. These were the only legal causes of making a demand of this kind; but in the subsequent times of degeneracy, the most frivolous pretences were very frequently made use of by the prince to oppress the lords, and by the lords to oppress their vassals; demanding subsidies at pleasure, which their inferiors were always obliged to comply with. Lastly, the escheat, which in former times took place only in cases of cowardice, treachery, or some other heinous crime, was now inflicted on the most trifling occasions. If the vassal happened to be too long in attending the court of his superior to take the oath of fealty; if he committed any action which could in the least be construed an infringement of the oath; if he neglected to give his lord warning of any misfortune which he might suppose was about to befall him; revealed anything concerning him; made love to his sister or daughter, &c. or even if he should grant a tenure of land to another person in form different from that in which he held his own; all these, nay others still more ridiculous, were judged sufficient reasons for the superior to seize on the estate of the vassal, and involve him and his family in ruin. Notwithstanding these oppressions, however, the vassal was still obliged to submit to his lord; to own him as his superior; and even, in appearance, to pay him the same respect as formerly, when unanimity and cordial affection subsisted between them. Still he was obliged to perform the same military service; because failure in that respect would have subjected him to forfeiture of lands according to the original agreement. A vast difference, however, now took place in the valour and activity which inspired the army. The vassals, forced into the field with desponding hearts, were indifferent as to the success of the cause in which they were engaged, and frequently obstructed instead of forwarding the operations of the field. Hence the sovereign found himself embarrassed; and, though nominally at the head of a martial and powerful people, was frequently unable to effect any thing by reason of the mutual hatred and dissension which every where prevailed. Thus the feudal states of Europe became unnaturally weak: a remedy was necessary; and it is remarkable, that the same remedy was applied all over the continent. This was, the making fiefs hereditary, which till now had only been granted for a long term of years; and, in return, burdening the lands with a certain number of soldiers, which were not to be refused upon any pretence whatever. Hence was derived the tenure of knight-service. A certain portion of land, burthened with the service of one soldier or knight, was called a knight's fee; and thus an estate, furnishing any number of soldiers, was said to contain as many knight's fees; so that now the manors, baronies, &c. became powerful according to the number of soldiers they were bound to furnish. In the grants from the crown, the nobility were obliged to furnish a certain number for the service of the sovereign; and in those from the nobility to their vassals, the like service was required. Even the commons who had grants from the crown furnished a certain proportion of

knights. The force of the nation was called into action by grants in capite, or from the sovereign and nobility. A numerous and powerful army was instantly assembled, and at once ready for action. Of this army the king was the general, the nobility the officers, and the vassals soldiers; the whole being exactly arranged, and capable of entering upon any expedition without the least delay. Thus a remedy was found in some measure for the weakness of the feudal sovereigns: but though the knights tenure could accomplish this, it could not bring back the former affection and cordiality, which had subsisted between the various ranks of people. On the contrary, by uniting them more firmly to one another by legal ties, it rendered matters rather worse. The oppression originating from the operation of the feudal incidents, still continued with unremitting violence. The grants of knights tenure were attended with the same oaths of homage and fealty; the same incidents of relief, wardship, marriage, aid, and escheat, with the feudal tenures. The princes promised to abate somewhat of their rigour in demanding the feudal perquisites, but did not keep their word. Laws were occasionally promulgated, and for some time had an effect; but palliatives soon became ineffectual, and a new state of weakness began to commence. The two remarkable eras in the feudal history are, the time before the invention of knight-service. (See KNIGHT), and that during which it continued. Fiefs were in a state of fluctuation from the destruction of the Roman empire till the ninth century; but they were rendered perpetual in France about A. D. 877, and were generally become so in every country in Europe about the beginning of the tenth. Du Cange, *voce Militia*, gives us an example of a knight-fee in A. D. 880. By the year 987, when Hugh Capet was raised to the throne of France, knight-service was become general all over Europe, and was introduced into England after having made its appearance in other countries. Dr. Stuart informs us, that it appears from the records of Malcom IV. in 1153, that knight service was known in Scotland, and that it was a novelty at that time. He thinks it even probable, that it was known in the time of David I. In England, however, there have been several doubts and inquiries among the learned concerning the introduction of the feudal laws. Many are of opinion, that they were introduced by William the Conqueror; and, consequently, that they were entirely unknown to the Anglo-Saxons: but others think, that they existed among the latter in the same form under which they were continued by the Normans. Dr. Stuart is of opinion, that the Saxons who settled in England could not be strangers to fiefs. He supposes the conformity of manners, which undoubtedly prevailed between the Saxons and other Barbarians, a sufficient proof that the hereditary grant of land, as well as the fluctuating state of feudal tenures which preceded it, were known to the former. Collateral proofs are derived from the spirit and tenure of the Anglo-Saxon laws, but especially from the grants of hereditary estates on condition of military service. The condition of the fiefs under the Anglo-Saxons was very different from what it was afterwards. In their times we find no mention made of those oppressions of which so much notice has already been taken; and this may easily be accounted for from the alteration of the feudal spirit in different ages. During the time that a warm and generous affection subsisted between the feudal superiors and vassals, the incidents were marks of generosity on the one part, and gratitude on the other; but as soon as a variance had taken place, by reason of the interested disposition which the introduction of luxury produced, the same incidents became sources of the most flagrant oppression. This was remarkably the case in the time of William the Conqueror; and, during the reign of king John, matters were come to such a crisis, that the people every where complained loudly, and demanded the restoration of the laws of Edward the Confessor. "What these laws of Edward the Confessor were (says Mr. Hume,) which the English every reign during a century and an half desired so passionately to have restored, is much disputed by antiquarians; and our ignorance of them seems one of the greatest defects of the English history." Dr. Stuart has offered an explanation, in a conjecture, that "by the laws or customs of the confessor, that condition of felicity was expressed which had been enjoyed during the fortunate state of the feudal association. The cordiality, equality, and independence, which then prevailed among all ranks in society, continued to be remembered in less prosperous times, and occasioned an ardent desire for the revival of those laws and usages which were the sources of so much happiness

happiness." Besides the great distinction between the state of fiefs under the Anglo-Saxons and under the Normans, they were no less distinguished by the introduction of knight-service. Hitherto the refinement of the English had been obstructed by the invasion of the Danes, and the insular situation of the kingdom; but after the Norman conquest the fiefs were made perpetual. Still, however, the knight-fee and knight-service were altogether unknown. William, the sixth duke of Normandy, was well acquainted with every thing relating to fiefs; for that duchy had experienced all the variety incidental to them from the time of its being granted to Rollo by Charles the Simple A. D. 912, to 1066, when William conquered England. On this event, a number of forfeitures took place among those who had followed the fortune of Harold II. Their estates were to be disposed of at the pleasure of the conqueror; and it was natural to suppose that he would follow the method practised in his own country. Hence the origin of knight-service in England. A grant of land, to any person whatever, was estimated at a certain number of knights fees; and each of these required the service of a knight. The grants of lands were even renewed to the old tenants under this tenure; so that by degrees the whole military people in the kingdom acquiesced in it. To accomplish this, Domesday Book is supposed to have been compiled, which contained an exact account of all the landed property of the kingdom. Hence it is to be concluded, not that William introduced fiefs into England, as some have imagined, but that he brought them to their ultimate state of perfection by the introduction of knight-service. This is evident from the laws enacted during his reign. In these it is not only mentioned that knight-service was enacted, but it was done expressly with the consent of the common council of the nation; which at that time was equivalent to an act of parliament. The invention of knight-service proved generally agreeable; for as only a few of the Anglo-Saxon fiefs were hereditary, the advancement of the rest to perpetuity, under the tenure of knight-service, must have been accounted an acquisition of some importance; as not only augmenting the grandeur and dignity of the sovereign, but securing the independence of the subject, and improving his property. In the happy state of the feudal association, there was indeed no necessity for the knight's fee; but when the discordance and oppression so often mentioned began to take place, it became then necessary to point out particularly every duty of the vassal, as well as of the lord; and this was fully done by the invention of knight-service. The nobles possessed duchies, baronies, and earldoms; which extensive possessions were divided into as many fees, each of them to furnish a knight for the service of the king, or of the superior: so that every feudal state could command a numerous army and militia to support and defend it in case of any emergency. The knights were also bound to assemble in complete armour whenever the superior thought proper to call, and to hold themselves in readiness whenever the king or superior found it convenient to take the field; so that thus the militia might be marched at the shortest notice to defend or support the honour of the nation. The knights were usually armed with a helmet, sword, lance, and shield; and each was obliged to keep a horse. This last requisite was owing to the contempt into which the infantry had fallen, through the prevalence of tournaments and luxuries of various kinds, though it was by means of the infantry that the barbarians had originally distinguished themselves in their wars with the Romans, and become able to cope with these celebrated warriors. All proprietors of fees or tenants by knight service fought on foot: the cavalry were distinguished by the name of battle; and the success of every encounter was supposed to depend on them alone. They only were completely armed; the infantry, being furnished by the villages under the jurisdiction of the barons, had at first only bows and slings; though afterwards they were found worthy of much greater attention. While the feudal association remained in perfection, the superior could at any time command the military service of his vassals; but in the subsequent degeneracy this service could neither be depended upon when wanted, nor was it of the same advantage when obtained as formerly. The invention of knight-service tended in a great degree to remedy this inconvenience. Those who were possessed of knights fees were now obliged to remain 40 days in the field at their own expense; and this without exception, from the great crown vassals to the smallest feudatories; but if longer service was required, the prince was obliged to pay his troops. In those times, however,

when the fate of nations was frequently decided by a single battle, a continuance in the field for 40 days was sufficient for ordinary occasions. Thus matters seemed once more to be restored nearly to their former state. It was now, as much as ever, the interest of the nation to act with unanimity in its defence, not only against foreign enemies, but against the tyranny of the prince over his subjects, or of one part of the subjects over the other. New inconveniences, however, soon began to take place, owing to the gradual improvements in life and the refinement of manners. From the first institution of military service, a fine had been accepted instead of actual appearance in the field. In the times of barbarity, however, when men accounted rapine and bloodshed their only glory, there were but few who made an offer of this compensation; but as wealth and luxury increased, and the manners of the people became softer, a general unwillingness of following the army into the field became also prevalent. A new tenure, called *escuage*, was therefore introduced; by which the vassal was only obliged to pay his superior a sum of money annually instead of attending him into the field. See *ESCUAGE*, and *KNIGHT-SERVICE*. Hence originated taxes and their misapplication; for as the king was lord paramount of the whole kingdom, it thence happened, that the whole *escuage* money collected throughout the nation centered in him. The princes then, instead of recruiting their armies, frequently filled their coffers with the money, or dissipated it otherwise, hiring mercenaries to defend their territories when threatened with danger. These being composed of the dregs of the people, and disbanded at the end of every campaign, filled all Europe with a disorderly banditti, who frequently proved very dangerous to society. To avoid such inconveniences, standing armies were introduced, and taxations began to be raised in every European kingdom. New inconveniences however arose. The sovereigns in most of these kingdoms, having acquired the right of taxation, as well as the command of the military power, became completely despotic: but in England the sovereign was deprived of this right by *Magna Charta*, which was extorted from him, so that, though allowed to command his armies, he could only pay them by the voluntary contributions of the people, or their submitting to such taxations as were virtually imposed by themselves. The author of *A View of Society in Europe*, has traced the remote sources of the feudal laws in an elegant and spirited manner. (Book I. Chap. II. Sect. I.) Tacitus informs us, that the individuals of each of the German nations cultivated by turns a track of land proportionable to their number, for the use of the whole; after which each individual received such an allotment of the cultivated track as his dignity required. These nations had not altered their political principles at the time they overran the Roman empire; and hence the provinces of it were then divided after the same manner. The most considerable allotment was bestowed on the king, as the most dignified person in the community, and this allotment was styled his domain; while the shares of citizens and warriors, which were likewise in proportion to the merit or dignity of each, constituted what was called *allodiality*. But as it often happened that all the land was not exhausted by these partitions, what remained was considered as the property of the community, and in the barbaric codes was called the lands of the *fisc*. In such German nations as had thus obtained a settlement, it was necessary that there should be a more close connection betwixt the sovereign and the chiefs, as well as between the chiefs and people, than in others. This was effected by means of the lands of the *fisc*; for of these the sovereign took possession, dealing them out to the chiefs under the burthen of appearing in arms whenever he should please to call; while the chiefs in like manner dealt out lands to those called their retainers, who were also obliged to supply them with military assistance in cases of necessity. Hence a political system was founded, which had a prodigious effect on society in all those countries where it prevailed. The intention and tendency of this system was to render the nation independent both at home and abroad; for while the people were all armed in their common defence, individuals were also properly guarded against the attacks of despotism. The power of the chiefs, who formed a regular nobility, was a counterpoise to that of the sovereign; while the number of the retainers and vassals, constituting the greatness and power of the nobility, was a proper barrier against aristocratical oppression; for a chief who oppressed his vassals evidently acted against his own interest.

FEOFFMENT, in law, [from *feoffare*, to give one a feud,] is.

still directed and governed by the feudal rules; insomuch that the principal rule relating to the extent and effect of the feudal grant, *tenor est qui legem dat feudo*, is the maxim of the law with relation to feoffments, *modus legem dat donationi*. And therefore, as in pure feudal donations, the lord, from whom the feud moved, must expressly limit and declare the continuance or quantity of estate which he meant to confer, *ne quis plus donasse præsumatur, quam in donatione expresserit*; so, if one grants by feoffment lands or tenements to another, and limits or expresses no estate, the grantee (due ceremonies of law being performed) hath barely an estate for life. For, as the personal abilities of the feoffee were originally presumed to be the immediate or principal inducements to the feoffment, the feoffee's estate ought to be confined to his person and subsist only for his life; unless the feoffer, by express provision in the creation and constitution of the estate, hath given it a longer continuance. These express provisions are indeed generally made; for this was for ages the only conveyance, whereby an estate was created in fee simple, by giving the land to the feoffee, to hold to him and his heirs for ever; though it serves equally well to convey any other estate of freehold. But by the mere words of the deed the feoffment is by no means perfected: a very material ceremony remains to be performed, called livery of seizing; without which the feoffee has but a mere estate at will. See SEISIN.

FEOFFOR, and **FEOFFEE**. Feoffor is he who infeoffs or makes a feoffment to another of lands or tenements in fee simple; and feoffee is the person infeoffed, or to whom the feoffment is made. See FEOFFMENT.

FER DE FOURCHETTE, in heraldry, a cross having at each end a forked iron, like that formerly used by soldiers to rest their muskets on.

FER DE MOULIN, **MILRIND**, or **INKE DE MOULIN**, in heraldry, is a bearing supposed to represent the iron ink, or ink of a mill, which sustains the moving wheel.

FERABAD, or **FERABAT**, a town of Persia, in the province of Mezanderan, 12 miles from the Caspian sea, seated among the mountains which bound its S. coast.

FERABAD, or **FERABAT**, a town of Persia, one mile and a half from Ispahan, extending nearly three miles along the banks of Zenderoad.

FERÆ, in natural history, an order of quadrupeds, of which the distinguishing characters are, fore-teeth conic, usually six in each jaw; tusks longer; grinders with conic projections; feet with claws; claws subulate; food carcasses and preying on other animals: this order comprehends the following genera:

Canis,	Phoca,
Didelphis,	Sorex,
Erinaceus,	Talpa,
Felis,	Viverra,
Mustela,	Ursus,

which see.

FERÆ NATURÆ. Animals of a wild nature are those in which a man has not an absolute but only a qualified and limited property which sometimes subsists, and at other times does not subsist. And this qualified property is obtained either by the art and industry of man, or the impotence of the animals themselves, or by special privilege. A qualified property may subsist in animals *feræ naturæ*, by the art and industry of man, either by his reclaiming and making them tame, or by so confining them that they cannot escape and use their natural liberty; such as deer in a park, hares or conies in an enclosed warren, doves in a dovehouse, pheasants or partridges in a mew, hawks that are fed and commanded by the owner, and fish in a private pond or in trunks. These are no longer the property of a man than while they continue in his keeping or actual possession; but if at any time they regain their natural liberty, his property instantly ceases, unless they have *animus revertendi*, which is only to be known by their usual custom of returning. A man may have a qualified property in animals *feræ naturæ*, by special privilege; that is, he may have the privilege of hunting, taking, and killing them, in exclusion of other persons: under which head may be considered all those animals which come under the denomination of game. Here a man may have a transient property in these animals, so long as they continue within his liberty, and may restrain any strangers from taking them therein; but the instant they depart into another liberty, this qualified property ceases. 2 Black. 391. Larceny cannot be committed

of things *feræ naturæ*, while at their natural liberty; but if they are made fit for food, and reduced to tameness, and known by the taker to be so, it may be larceny to take them. 1 Haw. 94. See GAME.

FERALIA, in antiquity, a festival observed among the Romans on Feb. 21, or, according to Ovid, on the 17th Feb. in honour of the manes of their deceased friends and relations. Varro derives the word from *inferi*, the shades, or from *fero*, to carry; on account of a repast carried to the sepulchres of such as the last offices were that day rendered to. Festus derives it from *ferio*, on account of the victims sacrificed. Vossius observes, that the Romans called death *fera*, cruel, and that the word *feralia* might arise thence.

FERCALA, or **FORCULA**, a town of Africa, in Biledulgerid, 50 miles W. of Segilmessa. Lon. 4. 30. W. Lat. 31. 40. N.

FERDINAND V. king of Spain, who married Isabella of Castile, whereby that kingdom was united to the Spanish crown. This illustrious pair laid the foundation of the glory and power of Spain. The conquest of Granada, and the discovery of America by Christopher Columbus, make their reign a celebrated era in history. He died in 1516, aged 63.

FERDINAND NARONKA, an island of South America, on the coast of Brasil. Lon. 32. 43. W. Lat. 3. 56. S.

FERE, a town of France, in the department of Aisne, and late province of Picardy, famous for its powder-mill and school of artillery. It is seated at the conflux of the Serre and Oise, 75 miles N.E. of Paris.

FERENTARI, in Roman antiquity, were auxiliary troops, lightly armed; their weapons being a sword, bow, arrows, and a sling.

FERENTINO, or **FIORENTINO** (the ancient Ferentinum), a city of Italy, in the Campania of Rome, 44 miles S. E. of Rome.

FERENTINUM, in ancient geography, a town of the Hernici in Latium, which the Romans, after subduing that nation, allowed to be governed by its own laws: now called Ferentino.

FERETRIUS, a surname of Jupiter, from *ferendo*, because he had assisted the Romans, or *feriendo*, because he had conquered their enemies under Romulus. He had a temple at Rome, built by Romulus, to which the spolia opima were always carried.

FERETRUM, among the Romans, the bier used in carrying out the bodies of the dead, which duty was performed by the nearest male relations of the deceased: thus sons carried out their parents, brothers their sisters, &c.

FERGUSON, JAMES, an eminent experimental philosopher and mechanic, born in Scotland, of poor parents. At the earliest age his extraordinary genius began to exert itself. He first learned to read by overhearing his father teach his elder brother: and he had made this acquisition before any one suspected it. He soon discovered a peculiar genius for mechanics, on seeing his father use a lever. He pursued this study a considerable length, even whilst very young; and made a watch in wood-work, from having once seen one. As he had no instructor, nor any help from books, every thing he learned had all the merit of an original discovery; and such he believed it to be. As soon as his age would permit, he went to service; in which he met with hardships, which rendered his constitution feeble through life. Whilst he was servant to a farmer (whose goodness he acknowledges in the modest and humble account of himself, which he prefixed to his last publication), he frequently contemplated the stars; and began the study of astronomy, by laying down, from his own observations only, a celestial globe. His kind master, observing these marks of his ingenuity, procured him the countenance and assistance of his superiors. By their help and instructions, he went on gaining farther knowledge, and was sent to Edinburgh. There he began to take portraits; an employment by which he supported himself and family for several years, both in Scotland and England, whilst he was pursuing more serious studies. In 1743 he came to London, where he published some astronomical tables and calculations, and gave lectures in experimental philosophy, which he repeated with success throughout the kingdom. In 1754 he published a brief description of the solar system, with an astronomical account of the year of our Saviour's Crucifixion, 8vo.; also an Idea of the Material Universe, deduced from a Survey of the Solar System. But his greatest work is his "Astronomy explained upon Sir Isaac Newton's Principles, and made easy to those who have

have not studied Mathematics." It first appeared in 1756, 4to. and has been several times reprinted in 8vo. On the accession of the present king, to whom he had read lectures, Mr. Ferguson obtained a pension of fifty pounds a year. In 1763 he was elected a fellow of the Royal Society, without paying the admission fee, or the annual subscriptions: the same year appeared his *Astronomical Tables and Precepts*, 8vo. In 1767 he published *Tables and Tracts relative to several Arts and Sciences*, 8vo. Besides these works he was the author of *Select Mechanical Exercises*; the *Young Gentleman and Lady's Astronomy*; an *Easy Introduction to Astronomy*; an *Introduction to Electricity*; the *Art of Drawing in Perspective made easy*; and several tracts of papers in the *Philosophical Transactions*. He was a man of the clearest judgement, and the most unwearied application to study; benevolent, meek, and innocent in his manners as a child: humble, courteous, and communicative; instead of pedantry, philosophy seemed to produce in him only diffidence and urbanity,—a love for mankind and for his Creator. He died in 1776, aged 66. His friends had generally considered him as possessing very little wealth, however he left behind about the sum of six thousand pounds.

FERIÆ, in Roman antiquity, holidays, or days upon which they abstain from work. Proclamation was generally made by the herald, by command of the *Rex Sacrorum*, or *Flamines*, that all should abstain from business; and whoever transgressed the order was severely fined.—The *feriæ* were of two kinds, public and private.

i. **FERIÆ PRIVATE**, the **PRIVATE FERIÆ**, were holidays observed by particular persons or families on account of birth-days, funerals, &c. These belonged to, and were one division of, the *dies festi*. See **FESTI**.

ii. **FERIÆ PUBLICÆ**, the **PUBLIC FERIÆ**, were of four kinds, viz.

1. **FERIÆ CONCEPTIVÆ** were moveable feasts, the days for the celebration of which were fixed by the magistrates or priests; of this sort were the *Feriæ Latinæ*, *Paganalia*, *Compitalia*, &c. which happened every year, but the days for keeping them were left to the discretion of the magistrates or priests. Of these the

FERIÆ LATINÆ were feasts at which a white bull was sacrificed, and the Latin and Roman towns provided each a set quantity of meat, wine, and fruits; and during the celebration, the Romans and Latins swore eternal friendship to each other, taking home a piece of the victim to every town. The festival was instituted by *Tarquinius II.* when he overcame the *Tuscans*, and made a league with the *Latins*, proposing to build a common temple to *Jupiter Latiæ*, at which both nations might meet and offer sacrifices for their common safety. At first the solemnity lasted but one day, but it was at different times extended to ten. It was held on the *Alban mount*, and celebrated with chariot races at the *capitol*, where the victor was treated with a large draught of wormwood drink.

2. **FERIÆ IMPERATIVÆ** were fixed and instituted by the mere command of consuls, praetors, or dictators, upon the gaining of some victory or other fortunate event.

3. **FERIÆ NUNDINÆ**. See **NUNDINÆ**.

4. **FERIÆ STATIVÆ** were kept as public feasts by the whole city upon certain moveable days appointed in their calendar;—such were the *Compitalia*, *Carmentalia*, *Lupercalia*, &c. See **AGONALIA**, **CARMENTALIA**, &c.

FERIÆ, in the *Romish breviary*, is applied to the days of the week; thus Monday is the *feria secunda*, Tuesday the *feria tertia*. The occasion of this was, that the first Christians used to keep the Easter-week holy. They have also extraordinary *feriæ*, viz. the three last days of passion-week, the two following Easter-days, and the second *feria* of rogation.

FERINA, the ancient city of *Thala* in *Africa*, taken and destroyed by *Metellus* in the war with *Jugurtha*. It was visited by *Mr. Bruce* in his late travels through *Africa*, who expected to have found many magnificent ruins in the place, but was disappointed. The only remarkable objects he met with were the baths, which are excessively warm.

FERMANAGH, a county of *Ireland*, in the province of *Ulster*; bounded by *Cavan* on the S. *Tyrone* on the N. and N.E. by *Tyrconnel* on the N.W. *Leitrim* on the S.W. and *Monaghan* on the W. It is 36 miles long and 24 broad. A great part of it is taken up with bogs, and the great lake, called *Lough Earne*.

FERMENT, in chemistry, any body which being applied to another, produces fermentation. Ferments are either matters already in the act of fermentation, or that soon run into this act. Of the first kind are the flowers of wine, yeast, fermenting beer, or fermenting wine, &c. and of the second are the new expressed vegetable juices of summer fruit. Among distillers ferments are all those bodies, which, when added to the liquor, only correct some fault therein, and by removing some obstacle to fermentation, forward it by secondary means; as also such as, being added in time of fermentation, make the liquor yield a larger proportion of spirit, and give it a finer flavour.

FERMENTATION, a sensible internal motion of the constituent particles of a moist, fluid, mixed, or compound body; by the continuance of which motion these particles are gradually removed from their former situation or combination, and again, after some visible separation is made, joined together in a different order and arrangement; so that a new compound is formed, having qualities very sensibly different from those of the original fluid. Fermentation, properly so called, is confined to the vegetable and animal kingdoms; for the effervescences between the acids and alkalies, however much they may resemble the fermentation of vinous liquors, are nevertheless exceedingly different. It is divided into three kinds; or rather, there are three different stages of it, viz. the vinous, the acetous, and the putrefactive. Of the first, vegetables alone are susceptible: the flesh of young animals is in some slight degree susceptible of the second. The fact related by *M. Grosier*, respecting the lamb, wine, and mutton spirit of the Chinese, seem to shew that animal substances are also capable of the vinous fermentation; unless we suppose that the flesh of these animals had been previously mixed with rice or some other vegetable substance. But animal substances are particularly susceptible of the third, which vegetables do not so easily fall into without previously undergoing the first and second. The produce of the first stage is wine, or some other vinous liquor; of the second, vinegar; and of the third, ammonia. See **BARM**, **BREWING**, **CHEMISTRY**, **VINEGAR**, &c. Fermentation is one of the most obscure processes in nature and no attempt has been made to solve it with any degree of probability. All that we know with regard to it is, that the liquor, however clear and transparent at first, no sooner begins to ferment than it becomes turbid; deposits a sediment, emits a great quantity of fixed air, and throws up a scum to the top, acquiring at the same time some degree of heat. The heat of the vinous stage, however, is but moderate; seldom or never exceeding that of the human body. The heat of the acetous is considerably greater; and that of the putrefactive is the greatest of all, insomuch that putrefying substances, when heaped together in great quantities, will sometimes break forth into actual flame. The spontaneous decomposition of bodies is retarded by extreme cold, by the sudden drying of the parts, or by preservation in closed vessels. The two first circumstances necessarily retard the chemical effects by depriving the parts of that fluidity which is almost indispensably necessary in chemical processes. It will easily be understood that the third condition will retard the spontaneous decomposition of bodies; when it is considered that the atmosphere itself is the solvent, or at least the receptacle of many of the component parts of bodies, with which it is disposed to unite. In well-closed vessels the parts of organized bodies, which are disposed to fly off in the elastic state, are prevented from escaping; and such parts as might form new combinations, by absorbing either the contents or the component parts of the atmosphere, are prevented for want of a free communication. The three conditions for the accomplishment of fermentation are, therefore, fluidity or moisture, moderate heat, or a due temperature, and the access of the air; the fermentation will likewise be modified according to the various component parts of bodies. In the vinous fermentation, the vegetable matter being held in solution by a considerable quantity of water, and a small quantity of yeast being added, the fluid becomes turbid and frothy; oxygen is absorbed, bubbles of carbonic acid gas are disengaged, which rise to the surface and break. The disengagement becomes more and more abundant; matcillage is separated, part of which subsides to the bottom; and part being expanded into froth by the elastic fluid forms yeast. During the course of several days, these effects gradually come to their height, and diminish again very slowly; and thus we obtain wine, brandy, cyder, beer, &c. from grapes, apples, pears, and other

other fruit, from every species of corn, as well as from saccharine and mealy roots. Their productions, however, so far differ from each other, that wine contains a greater proportion of spirituous, and less of mucilaginous particles, than beer; and that distilled spirits are deprived of all earthy and viscous ingredients. But, as all fermentable bodies, beside the inflammable spirit, possess a portion of acid and saline particles, which are not disengaged during the first, or vinous stage of fermentation, another separation of constituent parts takes place, immediately after the former is effected, without any farther discharge of air-bubbles, or intestine commotion of the fluid; though a volatile elastic vapour is observed to escape: thus, the spirituous parts, unless they have been previously drawn off by distillation, are communicated to the atmosphere, and this stage is termed the acetous fermentation; because its productions are the different sorts of vinegar obtained from wine, beer, fruit, corn, &c. Although, in most of the fermentable substances, these two stages naturally exceed each other; yet, by improper treatment, the acetous fermentation sometimes appears before the vinous can possibly commence, especially where the process is mismanaged by too great a heat; or, in those bodies which possess little or no inflammable matter in their elements. On the contrary, such vegetables as originally contain a sufficient proportion of aerial and fiery constituents, will easily ferment, by the simple means of warmth and water. But, if those elementary ingredients be in a manner deprived of their activity, by too many crude and viscid particles being combined with them, it will then be necessary to make certain additions, partly natural, and partly artificial, in order to dispose them more readily to ferment. These means, or additions, are such as have either already undergone fermentation: or are easily disposed to ferment: of the former kind are yeast and leaven; of the latter, honey, sugar, especially in a state of molasses, and other sweet substances, which, however, but slowly promote fermentation; nay, if they be previously diluted or dissolved in too hot water, and in that state added to the fermentable materials, they will entirely check that process. There are, besides, other means of promoting it; for instance, the dried leaves of the vine in a state of powder; cream of tartar, especially after it has been repeatedly moistened with strong vinegar, and afterwards dried; the crumb of bread prepared in a similar manner, and reduced to powder, &c. If fluidity, warmth, and fresh air, forward the fermentative process, the contrary of these, namely, dryness, cold, and exclusion of air, inevitably tend to prevent it. There are, however, cases in which it may become necessary to impede its progress; and we may then safely resort to the means above alluded to. But a certain degree of heat, such as we have before stated, appears to be indispensably necessary to conduct that process with success: an undue continuance, or the least increase of heat, proves detrimental, while an appropriate temperature, in a remarkable degree promotes fermentation. These different points of heat should be accurately noted and settled by the thermometer, or other certain methods; though, for common, or all economical purposes, they may be limited to what is in general termed a tepid and a fervid heat: the former is the bane of all vinous fermentation; the latter, or imperceptible warmth, is the great promoter of it. And if, notwithstanding a due attention to a proper temperature and all other circumstances, the liquor will not work of itself, it should then be assisted by such substances as are called ferments, and of which we have already given some account. In the Memoirs of the Philosophical Society at Manchester, Mr. Henry states the result of some experiments, in which he produced a fermentation both in bread and wort, and even in punch and whey. Conjecturing, therefore, yeast to be simply a quantity of fixed air detained among the mucilaginous parts of the fermenting liquor, he boiled some wheaten flour and water to the consistence of a thin jelly, which he put in the middle of Dr. Nooth's machine for communicating fixed air to water. A considerable portion of gas was absorbed; and the next day the mass was in a state of fermentation. The third day it bore so great a resemblance to yeast, that an experiment was made on some paste for bread; for which purpose it answered tolerably well, after being baked four or five hours. Mr. Henry made another experiment with some wort only; part of which was impregnated with air in the same manner as the flour and water, and when poured into the remainder, a brisk fermentation ensued in 24 hours; a strong head of yeast began to collect on the sur-

face, which on the third day was fit for tuning. In the course of the experiment, good bread was made with the yeast taken off the surface. The dispute which has arisen concerning Mr. Henry's mode of producing fermentation, may be easily decided by a comparative trial. Let two gallons of wort be put into a separate vessel; and kept in a moderate heat for a certain time: let also two other gallons be impregnated, either wholly or in part, according to Mr. Henry's method, be put into a similar vessel, and deposited in the same place. If the fermentation commence in the liquor impregnated with fixed air sooner than in the other, the air may be rationally conjectured to induce such fermentation. At all events, Mr. Henry's experiments, with respect to bread, are certainly decisive, and those relative to liquors may thus be easily ascertained; an object of the utmost importance to the public.

FERMENTED LIQUORS, are those obtained by the process described in the preceding article. See also **BEER**, **BREWING**, **CYDER**, **WINE**, &c. All liquors which have undergone the vinous fermentation, are considered as great antidotes to putrefaction: hence the total abstinence from them is assigned as one of the chief causes why the Turks are more liable to the plague, and other contagious diseases, than those nations among whom beer or wine is the common beverage. It has farther been remarked, and perhaps with justice, that since the custom of brewing and distilling liquors has prevailed in Europe, many of those cutaneous as well as putrid diseases, with which our forefathers were afflicted, have been less severe, and less frequent than they occurred in former ages. On the other hand, it is certain that all fermented liquors contain a considerable portion of air, which appears to combine the spirituous with the viscous parts, and which must necessarily be disengaged, before they are carried through the different organs of secretion. The development and discharge of these aerial particles, however, is not effected without considerable efforts: hence it may be safely asserted, that fermented liquors are less conducive to a sound and vigorous digestion of food than plain water. Yet, with respect to their influence on the human mind, it cannot be denied that such liquors in general have the effect of enlivening and exhilarating the spirits, especially of those who are naturally deficient in mental energy, or possess a weak and debilitated frame. Some writers, however, are of opinion, that they also have a strong tendency to corrupt the morals of mankind; an effect which they evidently produce, even in temperate climates, when taken to excess.

FERMO, a city of Italy, in the marquisate of Ancona, on the coast of the Adriatic, 17 miles S. E. of Macerata. Lon. 13. 50. E. Lat. 43. 6. N.

FERMOSA, or **BENIN**, a river of Africa, which runs into the Atlantic, near Loubo, on the coast of Benin.

FERN, in botany, **FILIX**. See **FILICES**. Fern is very common in dry and barren places. It is one of the worst weeds for land, and very hard to destroy where it has a deep soil to root in. In some grounds, the roots are found to the depth of eight feet. One of the most effectual ways to destroy it is often mowing the grass; and, if the field is ploughed up, plentiful dunging is good; but the most certain remedy is urine. However, fern, cut while the sap is in it, and left to rot upon the ground, is a very good manure. In some places of the north, the inhabitants mow it green, burn it, and make the ashes up into balls with water; which, when dried in the sun, they use to wash linens with, and find to be nearly as good as soap for that purpose.

FERNANDO DA NORONHA, a mountainous, but fertile island in the Atlantic, three miles long, near the coast of Brasil. Lon. 32. 33. W. Lat. 3. 56. S.

FERNANDO PO, or **FERNAND PAO**, an island of Africa, in the Atlantic, near the coast of Benin, 60 miles in circuit. It is fertile in rice, manioc, sugar-canes, fruits, and tobacco. Lon. 10. 45. E. Lat. 3. 20. N.

FERNEL, or **FERNELIUS**, **JOHN**, physician to Henry II. of France; was born in Picardy, about the end of the 15th century. Being sent to Paris to study rhetoric and philosophy, he applied himself in a most intense manner. All other pleasure was insipid to him. He cared neither for play, walking, entertainments, nor even for conversation. He read Cicero, Plato, and Aristotle. The reading of Cicero procured him this advantage, that the lectures he afterwards read on philosophical subjects were as eloquent as those of the other masters were barbarous. He also applied

applied himself earnestly to the mathematics. This continual study drew upon him a long fit of sickness, which obliged him to leave Paris. On his recovery, he returned and studied physic, and at the same time taught philosophy in the college of St. Barbara. After taking the degree of M. D. he improved himself in the mathematics; as far as the business of his profession would allow him. Henry II. dauphin, offered him the place of first physician to him; but Fernel preferring his studies to the hurry of a court, declined the employment. When Henry came to the throne, he renewed his offers, which Fernel still declined, but was at last prevailed on to accept of the office. He died in 1558, leaving behind him several works, as, *De Venæ Sectione*, a treatise on Physiology, *De abditis Rerum Causis*, seven books of Pathology, a book on Remedies, &c. which have been repeatedly printed, with his life prefixed, written by William Plantius, his disciple.

FERNS, a town of Ireland, in Wexford, 15 miles N. of Wexford.

FEROE ISLANDS. See **FERRO**.

FEROL, a sea-port of Peru, with a good harbour, 70 miles S. E. of Truxillo.

FERONIA, in ancient geography, a town of Italy, with a wood, sacred to the goddess Feronia.

FERONIA, the goddess of woods and orchards, so named from the town, where was a wood and temple consecrated to her.

FERONIA, in botany, a genus of the decandria monogynia class and order. Calyx five-parted; petals five; berry globular, covered with a hard, rough, woody shell, one-celled; seeds numerous. One species; viz. *F. elephantum*, elephant apple-tree, found in the East Indies.

FERRANDINA, or **FERRENDINA**, a town of Naples, 25 miles S. W. of Matera.

FERRARA, an ancient and large city of Italy, capital of the duchy of Ferrara, 24 miles N. E. of Bologna, and 38 N. W. of Ravenna.

FERRARA, or the **FERRARESE**, a duchy and province of Italy, in the late pope's territory, bounded on the N. by the state of Venice, on the W. by the duchies of Mantua and Mirandola, on the S. by the Bolognese and Romagna, of which it was formerly a part, and on the E. by the Adriatic. It is 50 miles long, and 43 broad along the coast; but grows gradually narrower towards the Mantuan. It is almost surrounded by the branches of the Po.

FERRARIA, in botany, a genus of the gynandria trigynia class and order. Natural order Ensata. One-styled; spathes one-flowered; petals six, waved and curled; stigmas cowed; capsule three-celled, inferior. There are two species, natives of the Cape of Good Hope.

FERREOLA, in botany, a genus of the diœcia hexandria class and order. Calyx one-leafed, three-cleft; corolla one-petaled, three-cleft; male, filaments six, inserted into a semi-globose receptacle; female, germ oval; berry round, smooth, two-seeded. There is but one species; viz. *F. buxifolia*.

FERRET, in zoology. See **MUSTELA**.

FERRET ISLAND, a small island on the E. coast of Labrador, Lon. 55. 40. W. Lat. 53. 40. N.

FERRETS, among glass-makers, the iron with which the workmen try the melted metal, to see if it be fit to work. The word is also used for those irons which make the rings at the mouth of the bottles.

FERRO, or **HIERRO**, the most westerly of the Canary Islands, near the African coast. The first meridian was formerly reckoned in most maps from its western extremity; but now, the geographers of almost every kingdom make their respective capitals the first meridian, as we do London. It affords very little water, except what is supplied in a very surprising manner by a tree which grows in it. Lon. 17. 46. W. Lat. 27. 47. N.

FERRO, **FARO**, **FARRO**, or **FEROE ISLANDS**, a cluster of islands in the Northern ocean, between 5° and 8° Lon. W. and between 61° and 63° Lat. N. They belong to Denmark. There are 17 which are habitable; each of which is a lofty mountain arising out of the waves, divided from the others, by deep and rapid currents.

FERROL, a sea-port town of Spain, in the province of Galicia, 21 miles N. E. of Corunna, Lon. 8. 46. W. Lat. 43. 28. N.

FERRUGINOUS, any thing partaking of iron, or that contains particles of that metal. See **IRON**. It is particularly applied to certain mineral springs, whose waters are impregnated with the particles of iron, generally termed chalybeates.

FERRUGO, **RUST**. See **IRON** and **RUST**.

FERRUM, **IRON**. See **IRON**.

FERRY is a liberty by prescription, or by the king's grant, to have a boat for passage, on a frith or river, for carrying passengers, horses, &c. over it for a reasonable toll.

FERTILITY, that quality which denominates a thing fruitful or prolific. Nothing can produce fertility in either sex, but what promotes perfect health; and therefore, all means and medicines, all nostrums and specifics to procure fertility, different from those which procure good blood and spirits, are errant quackery. To increase the fertility of vegetables, says Lord Bacon, we must not only increase the vigour of the earth and of the plant, but also preserve what would otherwise be lost: whence he infers, that there is much saved by setting, in comparison of sowing. Evelyn's *Sylva*, the *Philosophical Transactions*, the *French Memoirs*, and the works of the latest and best writers on Agriculture, may be consulted on this subject.

FERULA, [from *ferire*, Lat. to strike,] a little wooden pallet or slice, reputed the schoolmaster's sceptre, wherewith he chastises his pupils by striking them on the palm of the hand.

FERULA has also been used to denote the prelate's crosier and staff.

FERULA, in the eastern empire, was the emperor's sceptre, as is seen on divers medals; it consists of a long stem, or shank, and a flat square head. The use of the ferula is very ancient among the Greeks, who used to call their princes *ναβηκοφοροι*, *q. d.* "ferula-bearers."

FERULA, in the ancient eastern church, signified a place separated from the church; wherein the penitents, or the catechumens of the second order, called *auscultantes*, *αυσκουταντοι*, were kept as not being allowed to enter the church; whence the name of the place, the persons therein being under penance or discipline: sub *ferula* erant ecclesiæ.

FERULA, **FENNEL-GIANT**, in botany, a genus of the digynia order, and pentandria class of plants; natural order, Umbellata. Fruit oval, compressed, plane, with three striæ on each side. There are nine species; all herbaceous perennials, rising from three to ten or twelve feet high, with yellow flowers. The drug assafetida is obtained from a species of ferula, though not peculiarly; being also produced by some other plants. See Plate LXV.

FESCAN, or **FESCHAMP**, a town of France, in the department of Lower Seine, 28 miles N. W. of Rouen.

FESCENNIA, or **FESCENNIUM**, in ancient geography, a town of Etruria, above Falerii, near the Tiber, where the Fescennine verses were first invented: now called Galese.

FESCENNINE VERSES, in antiquity, were a kind of satirical verses, full of wanton and obscene expressions, sung or rehearsed by the company, with many indecent gestures and dances, at the solemnization of a marriage among the Romans. (Hor. ep. i. lib. v. 145.) The word is borrowed, according to Macrobius, from *fascinum*, a charm; the people supposing songs proper to drive away witches, or prevent their effect; but its more probable origin is from Fescennia.

FESCHAMP. See **FESCAN**.

FESCUE, [*veese*, Dutch; *festu*, Fr.] a small wire by which those who teach to read point out the letters.

FESSE, in heraldry. The fesse, so called of the Latin word *fascia*, a band or girdle, possessing the third part of the escutcheon over the middle: it is one of the nine honourable ordinaries, consisting of a line drawn directly across the shield, from side to side, and containing the third part of it, between the honour-point and the nombril. See **HERALDRY**.

FESSE, **PARTY PER**, implies a parting across the middle of the shield, from side to side, through the fesse point.

FESSE POINT, is the exact centre of the escutcheon. See **POINT** and **HERALDRY**.

FESSE WAYS, or **IN FESSE**, denotes any thing borne after the manner of a fesse; that is, in a rank across the middle of the shield.

FESTENBERG, a town of Silesia, in the principality of Oels, 14 miles N. W. of Wurtemberg.

FESTI DIES, in Roman antiquity, certain days in the year, devoted to the honour of the gods.

FESTINO, in logic, the third mood of the second figure of the syllogism, the first proportion whereof is an universal negative, the second a particular affirmative, and the third a particular negative; as in the following example:

FES No bad man can be happy.

TI Some rich men are bad men.

NO Ergo, some rich men are not happy.

FESTOON, [*feston*, French,] an ornament of carved work in the form of a wreath or garland of flowers, or leaves twisted together, thickest at the middle and suspended by the two extremes, where it hangs down perpendicularly.

FESTOONS are now chiefly used in friezes, and other vacant places which want to be filled up and adorned; being done in imitation of the long clusters of flowers, which the ancients placed on the doors of their temples and houses on festival occasions.

FESTUCA, or **FESCUE**, in botany, a genus of the digynia order, and triandria class of plants; natural order, Gramina. Calyx bivalved; spicula or partial spike oblong, roundish; glumes acuminate. There are 26 species; of which, the

F. FLUITANS, **FLOATING FESCUE**, so called from its growing in wet ditches and ponds, is remarkable for the uses made of its seeds, which are small, but very sweet and nourishing. They are collected in several parts of Germany and Poland, under the name of manna seeds; and are used at the tables of the great, in soups and gruels, on account of their nutritious quality and grateful flavour. When ground to meal, they make bread very little inferior to that in common use. The bran, separated in preparing the meal, is given to horses that have worms. Geese are also very fond of these seeds. Mr. Lightfoot recommends this as a proper grass to be sown in wet meadows.

FETE, a French word, signifying a feast, festival, or holiday, half adopted into the English language, but which, with many others, it stands in no need of.

FETHARD, a borough of Ireland, in Tipperary, 8 miles S. E. of Cashel, and 86 S. S. W. of Dublin.

FETHARD, a town of Wexford, on the coast, 81 miles S. of Dublin. Lon. 6. 42. W. Lat. 52. 10. N.

FETLOCK, in the manege, a tuft of hair growing behind the pastern joint of many horses; for those of a low size have scarce any such tuft.

FETU, or **AFFETU**, a small kingdom of Africa, on the Gold Coast, E. of Commendo. It is naturally fertile, abounding in corn, fruits, trees, palm wine, oil, and cattle. The Dutch have a fort in it.

FETUS. See **FÆTUS**.

FEU, the tenure by which lands are held. See **FEE**, **FEE-FARM**, **FEU-HOLDING**, and **TENURE**.

FEUD, in our ancient customs, is used for a capital quarrel or enmity, not to be satisfied but with the death of the enemy; and thence usually called deadly feud. Feud, called also feida, and faida, in the original German signifies *guerram*, i. e. war. Lambert writes it *feeth*, and says, "it signifies *capitales inimicitias*, implacable hatred." In Scotland and the north of England, feud is particularly used for a combination of kindred, to revenge the death of any of their blood, against the killer and all his race, or any other great enemy.

FEUD, [*Feoda*,] in law, the same with Fief, or Fee. See **FEOD** and **FEODAL SYSTEM**.

FEUDAL, or **FEODAL**. See **FEODAL**.

FEUDATORY. See **FEODAL** and **TENURE**.

FEUDERSDORF, a town of Upper Saxony, in Brandenburg, 7 miles W. N. W. of Storkow.

FEU-DUTY, in Scots law, the annual rent or duty which a vassal, by the tenure of his right, becomes bound to pay to his superior.

FEVER. See **MEDICINE**. The ancients deified the diseases as well as the passions and affections of men. Virgil places them in the entrance into hell, *Æn. vi. 273*.

FEVER, in farriery. See **FARRIERY**.

FEVERFEW, in botany. See **MATRICARIA**.

FEVERFEW, **BASTARD**. See **PARTHENIUM**.

FEVERSHAM, or **FAVERSHAM**, a town of England in

Kent, seated on a branch of the Thames, 9 miles W. of Canterbury, and 47 E. of London.

FEU-HOLDING, in Scots law, that particular tenure by which a vassal is bound to pay an annual rent or feu-duty to his superior.

FEVILLEA, in botany, a genus of the pentandria order, and dicæcia class of plants; natural order, Cucurbitaceæ. Male, calyx five-cleft; corolla five-cleft; stamens five; nectary five converging filaments: female, calyx five-cleft; styles three; pome hard, three-celled, corticose. There are two species.

FEVRE, **JAMES LE**, or **JACOBUS FABER**, as he stiled himself in his Latin works, "was, says Bayle, a very little man, but a great genius, and of much learning." He was born in Picardy, and was one of those who began to expel barbarism from the university of Paris. Being suspected of Lutheranism, he retired to Meaux, and afterwards to Blois, Guienne, and Navarre, in which kingdom he enjoyed the protection and favour of Queen Margaret. Like his friend Erasmus, though he disapproved of the errors of the church of Rome, yet as he also censured some things in the conduct of the reformers, he never outwardly left it, which is said to have given him great remorse before his death. He published translations, notes, and commentaries, on Paul's epistles in 1512, and on other parts of the New Testament in 1522.

FEVRE, **TANEGUI LE**, an excellent scholar in the Greek and Roman learning, born at Caen in Normandy, in 1615. Cardinal Richelieu gave him a pension of 2000 livres to inspect all the works published at Louvre, and designed to have made him principal of a college he was about to erect at Richelieu. But the cardinal's death cut off his hopes; and Cardinal Mazarine having no great relish for learning, his pension was ill paid. Some time after, the Marquis de Franciere, governor of Langres, took him along with him to his government, where he embraced the Protestant religion; after which he was invited to Saumur, where he was chosen Greek professor. He there taught with extraordinary reputation. Young men were sent to him from all the provinces in the kingdom, and even from foreign countries, while divines and professors themselves gloried in attending his lectures. He was preparing to go to Heidelberg, whither he was invited by the Prince Palatine, when he died, aged 57. He wrote Notes on Anacreon, Lucretius, Longinus, Phædrus, Justin, Terence, Virgil, Horace, Elian, Eutropius, Aurelius Victor, Dionysius, &c. A short account of the lives of the Greek poets. Two volumes of letters; and many other works. He left a son, and two daughters, one of whom was the celebrated Madame Dacier. In his Latin works he assumed the name of Tanaquil Faber.

FEURS, an ancient town of France, in the department of Rhone and Loire, and late province of Forez; seated on the Loire, 25 miles S. W. of Lyons.

FEZ, a country of Africa, in Barbary, formerly a very extensive kingdom, but now united to the empire of Morocco. It is bounded on the E. by Algiers, on the S. by Morocco and Tasilt, on the W. by the Atlantic, and on the N. by the Mediterranean and the Straits of Gibraltar. It is divided into nine provinces. The climate is temperate, and the soil, though badly cultivated, is fertile; producing corn, lemons, oranges, figs, olives, citrons, dates, almonds, raisins, sugar-canes, cotton, and flax. The country abounds with honey, wax, salt, gums, &c. as well as with variety of wild and domestic animals. The lions are reckoned the most daring in all Africa, and the horses are the finest in Barbary. Camels, ostriches, goats, sheep, hares, &c. are numerous. The chief exports are skins, furs, wool, Morocco leather, gold dust, ostrich feathers, and the productions mentioned above; the imports, arms, ammunition, steel, iron, brass, quick-silver, spiceries, cochineal, vermilion, alum, opium, tartar, English woollen cloths, silks, muslins, calicoes, fustians, damasks, brocades, velvets, linens, paper, combs, watches, looking-glasses, and earthenwares. Though Fez is the capital, Salée is the chief port for the pirates.

FEZ, the capital of the above kingdom, is described as a very large place, surrounded with high walls, within which there are hills and valleys, only the middle being level and flat. The river, which runs through the city, is divided into two streams, from which canals are cut into every part of the town; so that the mosques, colleges, palaces, and the houses of great men, are amply supplied with water. It contains about 80,000 inhabitants; and is seated

on the Cebu, 200 miles N. N. E. of Morocco, and 160 S. of Gibraltar. Lon. 5. 5. W. Lat. 34. 4. N.

FEZZAN, a country of Africa, forming a small circular domain in the vast wilderness, bounded on the N. by Tripoli; on the E. by the deserts which divide it from Egypt; on the S. by Bornou; and on the W. by the deserts of Zaara; lying between 25° and 30° Lat. N. It is an extensive plain, surrounded by mountains, except on the W. Here, as in Upper Egypt, rain is hardly known; but the springs are so abundant, and there is such an ample store of subterranean waters supplied from the neighbouring heights, that few regions exhibit a richer vegetation.

FIANONA, a borough and castle of Maritime Austria, in the province of Istria, and district of Albona. It is four miles from Albona, and 19 E. of Rovigno.

FIASONE, or **MONTE FLASONE**, a town of Italy, on a mountain, 12 miles N. W. of Viterbo.

FIAT, [Lat. *i. e.* let it be done,] in law, a short warrant signed by a judge, for making out and allowing certain processes.

FIBRARIE, a class of fossils. See **ASBESTOS**.

FIBRE, [*fibre*, Fr. *fibra*, Lat.] in anatomy, a perfectly simple body, or at least as simple as any thing in the human structure; being fine and slender like a thread, and serving to form other parts. Some are hard, as the bony fibres; others soft, as those which form all the other parts. The fibres are divided, according to their situation, into straight, oblique, transverse, annular, and spiral; being found arranged in all these directions in different parts of the body. See **ANATOMY**.

FIBRE is also used to denote the slender filaments which compose other bodies, whether animal, vegetable, or mineral; but more especially the capillary roots of plants.

FIBRIN, is that substance which constitutes the fibrous part of the muscles of animals. If a quantity of blood, newly drawn from an animal, be allowed to remain at rest for some time, a thick red clot gradually forms in it, and subsides. Separate this clot from the rest of the blood, put it into a linen cloth, and wash it repeatedly in water till it ceases to give out any colour or taste to the liquid; the substance which remains after this process is denominated fibrin. It has been long known to physicians under the name of the fibrous part of the blood, but has not till lately been accurately described. It may be procured also from the muscles of animals. The properties of fibrin are the following: 1. It is tasteless, of a white colour, fibrous, elastic, and resembles gluten. 2. It is insoluble in water and in alcohol. 3. It is not dissolved by alkalies. 4. But acids dissolve it without difficulty. 5. With nitric acid it gives out much azotic gas. 6. When distilled it yields much carbonate of ammonia and oil. 7. It soon putrefies; when kept moist, becomes green, but does not acquire any resemblance to cheese. See **GLUTEN**.

FIBROLETE, a mineral, of the topaz family, first observed by Bournon, in the matrix of the imperfect corundum. Colour white or dirty grey; specific gravity 3,214; texture fibrous; cross fracture compact; internal lustre glossy; infusible by the blow-pipe. Usually in shapeless fragments. It is composed of

58,25 alumina

38,00 silica.

3,75 a trace of iron, and loss.

100,00

FIBROUS ROOT. See **BOTANY**.

FIBULA, [Lat.] the outer and less bone of the leg, much smaller than the tibia: it lies on the outside of the leg; and its upper end, which is not so high as the knee, receives the lateral knob of the upper end of the tibia into a small sinus, which it has in its inner side. Its lower end is received into the small sinus of the tibia, and then it extends into a large process, which forms the outer ankle. See **ANATOMY**.

FIBULA, in antiquity, was a sort of button, buckle, or clasp, used by the Greeks and Romans for keeping close or tying up some part of their cloaths. They were of various forms, and often adorned with precious stones. Men and women wore them in their hair and at their shoes.

FIBULA, in surgery, an instrument used among the ancients for closing wounds.

FICARI, a town and river of the French empire, in the island and department of Corsica. It is 12 miles W. of Bonifacio.

FICHERULOLO, or **FICHERUOLO**, a town of Italy, in the Ferrarese, on the Po. It is 13 miles W. N. W. of Ferrara.

FICHTELBERG, a mountain, or rather a ridge of mountains, in Franconia, extending nearly from Bareuth to Eger in Bohemia, 16 miles in length from E. to W. and as much in breadth from N. to S.

FICOIDES, a name given to several distinct plants, as the mysembranthemum, musca, and opuntia. See **MYSEMBRANTHEMUM**, &c.

FICTION. See **ALLEGORY**, **FABLE**, **POETRY**, &c.

FICTION OF LAW, is allowed of in several cases; but it must be framed according to the rules of law; and there ought to be equity and possibility in every legal fiction. Fictions were invented to avoid inconvenience; and it is a maxim invariably observed, that no fiction shall extend to work an injury; its proper operation being to prevent a mischief, or remedy an inconvenience, that might result from the general rule of law. 3 Black. 434.

FICUS, the **FIG-TREE**: a genus of the triëcia order, and polygamia class of plants; natural order Scabridæ. Receptacle common, turbinate, fleshy, connivent; inclosing the florets either in the same or in a distinct one. Male calyx tripartite; no corolla; three stamina: female calyx quinquepartite; no corolla; pistil one: seed one. There are 56 species, of which the following are the most remarkable.

1. **FICUS CARICA**, the **COMMON FIG-TREE**, with an upright stem branching 15 or 20 feet high, and garnished with large palmated or hand-shaped leaves. Of this there are many varieties; as, 1. The common fig-tree, with large, oblong, dark purplish blue fruit, which ripens in August either on standards or walls, and of which it carries a great quantity. 2. The brown or chestnut fig; a large, globular, chestnut-coloured fruit, having a purplish delicious pulp, ripening in July and August. 3. The Black Ischia fig; a middle-sized, shortish, flat-crowned, blackish fruit, having a bright pulp; ripening in the middle of August. 4. The green Ischia fig; a large, oblong, globular headed, greenish fruit, slightly stained by the pulp to a reddish brown colour; ripens in the end of August. 5. The brown Ischia fig; a small, pyramidal, brownish yellow fruit, having a purplish very rich pulp; ripening in August and September. 6. The Malta fig: a small flat-topped brown fruit, ripening in the middle of August or beginning of September. 7. The round brown Naples fig; a globular, middle-sized, light brown fruit, and brownish pulp; ripe in the end of August. 8. The long, brown, Naples fig; a long dark brown fruit, having a reddish pulp; ripe in September. 9. The great blue fig; a large blue fruit, having a fine red pulp. 10. The black Genoa fig; a large, pear-shaped, black-coloured fruit, with a bright red pulp; ripe in August. The carica is frequently cultivated in this country, and is the only species which does not require to be kept in a stove. It may be propagated either by suckers arising from roots by layers, or by cuttings. The suckers are to be taken off as low down as possible; trim off any ragged part at bottom, leaving the tops entire, especially if for standards; and plant them in nursery lines at two or three feet distance, or they may at once be planted where they are to remain; observing, that if they are designed for walls or espaliers, they may be headed to six or eight inches in March, the more effectually to force out lateral shoots near the bottom; but, if intended for standards, they must not be topped, but trained with a stem, not less than 15 or 18 inches for dwarf standards, a yard for half-standards, and four, five, or six feet for full standards. Then they must be suffered to branch out to form a head; observing, that, whether against walls, espaliers, or standards, the branches or shoots must never be shortened unless to procure a necessary supply of wood: for the fruit is always produced on the upper parts of the young shoots; and if these are cut off, no fruit can be expected. The best season for propagating these trees by layers is in autumn; but it may be also done any time from October to March or April. Choose the young pliable lower shoots from the fruitful branches: lay them in the usual way, covering the body of the layers three or four inches deep in the ground, keeping the top entire, and as upright as possible; and they will be rooted and fit to separate from the parent in autumn; when they may be planted either in the nursery, or where they are to remain. The time for propagating by cuttings is either at the fall of the leaf, or in March: choose well ripened shoots of the preceding summer: short, and of robust growth, from about 12 to 15 inches long;

long; having an inch or two of the two years wood at their base, the tops left entire; and plant them six or eight inches deep, in a bed or border of good earth, in rows two feet asunder. When planted in autumn, it will be eligible to protect their tops in time of hard frost, the first winter, with any kind of long loose litter. The caprifrication of the fig-tree, which for many ages was so enigmatical, is particularly worthy of attention, not only as a singular phenomenon in itself, but as it furnishes one of the most convincing proofs of the reality of the sexes of plants. The flowers of the fig-tree are situated within a pulpy receptacle, which we call the fig. Of these receptacles, in the wild fig-tree, some, as the caprificus, have male flowers only; and others, as the erinosyce, have male and female, both distinct, though placed in the same receptacle; but in the cultivated fig, these contain only female flowers; which are fecundated by means of a kind of gnat bred in the fruit of the wild fig-trees, which pierces that of the cultivated, to deposit its eggs within; at the same time diffusing within the receptacle the farina of the male flowers. Without this operation the fruit may ripen, but no effective seeds are produced. Hence the garden fig can only be propagated by layers and cuttings, in those countries where the wild fig is not known. The process of thus ripening the fruit, in the oriental countries, is not left to nature, but is managed with great art, and different degrees of dexterity, so as to reward the skilful husbandman with a much larger increase of fruit than would otherwise be produced. A tree of the same size, which, in the S. of France, where caprifrication is not practised, may produce about 25 pounds of fruit, will, by that art, in the Grecian islands, bring ten times that quantity.

2. *Ficus Caprificus*, the wild fig-tree, has male flowers only; the farina of which is used to impregnate the female flowers of the common fig-tree.

3. *Ficus Erinosyce*, another species of wild fig-tree which has male and female flowers distinct.

4. *Ficus Religiosa*, the BANIAN TREE, or INDIAN FIG, is a native of several parts of the East-Indies. It hath a woody stem, branching to a great height and vast extent, with heart-shaped entire leaves ending in acute points. Of this tree Milton has given a description equally beautiful and just, in his *Par. Lost. B. ix. l. 1100*.

FID, [*fitta*, Italian,] a pointed iron with which seamen untwist their cords.

FIDS or **FIDDS**, are likewise used at sea to splice or fasten ropes together. There are also fids of wood, made tapering in one end, but much larger than the iron ones. The pin in the heel of the topmast, which bears it upon the chess-tree, is likewise called a fidd.

FIDA, a kingdom of Africa. See **WHIDAH**.

FIDD-HAMMER, a hammer the handle of which is a fidd, or made tapering into that form.

FIDDLE. See **VIOLIN**.

FIDEI COMMISSUM, in Roman antiquity, an estate left in trust with any person, for the use of another.

FIDE-JUSSOR, in the civil law, is a surety, or one that obliges himself in the same contract with a principal, for the greater security of the creditor or stipulator.

FIDES, **FAITH** or **FIDELITY**, one of the virtues deified by the Romans, had a temple near the Capitol, founded by Numa Pompilius; but no animals were offered, or blood spilt, in her sacrifices. During the performance of her rites, her priests appeared in white vestments, with their heads and hands covered with linen, to shew that fidelity ought to be sacred.

FIDIUS, in Pagan worship, a god who presided over alliances and promises. This deity, whom the Romans borrowed from the Sabines, was also called Sanctus, Semon, and Semi pater.

FIDRIE, an island of Scotland, in the Frith of Forth.

FIECHTACH, a town of Germany in Bavaria; six miles N. of Retz.

FIEF. See **FEE**, **FEOD**, and **FEODAL SYSTEM**. It has been an object of enquiry among the learned, in what nation of barbarians fiefs had their origin. It is probable, that they took place in the different nations of Europe, nearly about the same time, on the same principles, and were continued by similarity of manners, conquests, &c. so that we cannot ascribe the prevalence of them to imitation. In France, we find fiefs mentioned as early as the age of Childebert I. They were introduced into Italy by the

Lombards; among whom the customs and laws relating to fiefs seem very early to have made rapid advances. Giannone Hist. of Naples, b. iv. They were introduced into Spain before the invasion of the Moors, A. D. 710.

FIELD, in agriculture, a piece of ground used for tillage or pasture.

FIELD, in heraldry, is the whole surface of the shield, or, continent, so called, because it contains those achievements anciently acquired in the field of battle. It is the ground on which the colours, bearing, metals, furs, charges, &c. are represented. Among the modern heralds, field is less frequently used in blazoning than shield or escutcheon. See **SHIELD** and **HERALDRY**.

FIELD, RICHARD, D. D. an eminent divine of the church of England, born at Hempstead in Hertfordshire, in 1561, and admitted at Magdalen college, Oxford, in 1577. In 1598 he was appointed chaplain to Q. Elizabeth, and on the accession of K. James I. was made chaplain to that monarch. In 1604, he was appointed canon of Windsor, and in 1609 dean of Gloucester. He was much esteemed by K. James, who, in his usual punning way, stiled him "a Field for God to dwell in;"—an expression improved by Fuller, who in quoting one of his works, stiled him "a Field which the Lord had blessed." He died Nov. 21, 1616, just when James was intending to appoint him bishop of Oxford. He wrote Five Books on the Church, and several other tracts on religion.

FIELD BOOK, in surveying, that wherein the angles, stations, distances, &c. are set down.

FIELD COLOURS, in war, are small flags of about a foot and a half square, which are carried along with the quarter-master general, for marking out the ground for the squadrons and battalions.

FIELDFARE, in ornithology. See **TURDUS**.

FIELD MARSHAL, a commander of an army in the field, an office now disused in the British armies, though still of high rank in other European armies. Lord Trawley, appointed in 1763, was the last British Field Marshal.

FIELDPIECE, small cannon used in battles, but not in sieges; they are from three to 12 pounds.

FIELD STAFF, a weapon carried by the gunners, about the length of a halbert, with a spear at the end; having on each side ears screwed on, like the cock of a match-lock, where the gunners screw in lighted matches when they are upon command; and then the field-staffs are said to be armed.

FIELD WORKS, in fortification, are those thrown up by an army in besieging a fortress, or by the besieged to defend the place. Such are the fortifications of camps, highways, &c.

FIELEWEER, an island of Norway, on the W. coast, 22 miles long, and four broad.

FIERENZO, St. a sea-port town of France, in the island and department of Corsica.

FIERENZUOLO, a town of Italy, in Parma, on the Larda; 12 miles S. E. of Placentia.

FIERI FACIES, in law, a judicial writ, that lies at all times within the year and day, for him that has recovered in an action of debt or damages, to the sheriff, to command him to levy the debt, or the damages of his goods, against whom the recovery was had.

FIESOLA, **FIESOLI**, or **FIEZOLI**, a town of Italy, in Tuscany, between Florence and Pratolino, anciently called Falsulæ, 3 miles N. E. of Florence.

FIFE, or **FIFESHIRE**, a county of Scotland, bounded on the W. by Clackmannan, N. by Perthshire, E. by the German ocean, and S. by the Frith of Forth. It is above 32 miles long, and from seven to 17 broad; but along the coast, from Crail to Culross, it extends about 40 miles in length. The face of the country is various. Towards the W. it is mountainous, having the Lomond hills rising to a great height; to the E. it is flat, well cultivated, and produces grain of all kinds in great plenty.

FIFE, in music, a wind instrument consisting of a small pipe.

FIFE-RAILS, in a ship, are those placed on banisters, on each side of the top of the poop, and so along with hauncers or falls. They reach down to the quarter-deck, and to the stair of the gang-way.

FIFTEENTH, an ancient tribute or tax laid upon cities, boroughs, &c. through all England, and so termed because it amounted

amounted to a fifteenth part of what each city or town had been valued at; or it was a fifteenth of every man's personal estate according to a reasonable valuation. In Doomsday book, there are certain mentioned for levying this tribute yearly; but since, any such tax cannot be levied out by parliament.

FIFTH, in music, one of the harmonical intervals or concords. See **INTERVAL**. The fifth is the second in order of the concords, the ratio of the chord that affords it is 3 : 2. See **CHORD** and **CONCORD**. It is called fifth, as containing five terms or sounds between its extremes, and four degrees, so that in the natural scale of music, it comes in the fifth place or order from the fundamental. The ancients called this fifth diapente. The imperfect and defective fifth called by the ancients semi-diapente is less than the fifth by a less semitone.

FIG, or **FIG-TREE**. See **FIGUS**. Figs are a considerable article in the materia medica, chiefly employed in emollient cataplasms and pectoral decoctions. The best are those which come from Turkey.

FIGARUOLO, an island of Maritime Austria, on the coast of Istria.

FIGEAC, a town of France, in the department of Lot, 27 miles E. of Cahors.

FIG-GNAT, in entomology. See **CULEX**.

FIGHIG, a town of Africa, in Biledulgerid, S. of Atlas, 240 miles E. S. E. of Mequinez. Lon. 1. 5. W. Lat. 32. 20. N.

FIG-TREE BAY, a bay on the N. E. coast of Jamaica.

FIG-TREE BAY, a bay on the S. W. coast of St. Kitts.

FIGUEIRO DOS VINHOS, a town of Portugal, in Estremadura, 20 miles N. of Thomar.

FIGUERA, **FIGUERAS**, or **St. FERNANDO DE FIGUERAS**, a strong town of Spain in Catalonia, which was esteemed impregnable, till the 27th Nov. 1794, when it was taken by the French, though garrisoned with 9107 men, and defended by 171 pieces of cannon. The military chest, 200,000lb. of powder, and a vast quantity of provisions, fell into the hands of the republicans. During the siege, the generals on both sides were killed; viz. citizen Dugommier on the 17th and Count de La Union on the 20th. It lies 10 miles W. of Rosas. Lon. 2. 46. E. Lat. 42. 18. N.

FIGURABILITY, [from *figurabile*,] the quality of being capable of a certain and stable form.

FIGURAL, **FIGURATE**, or **FIGURATIVE**, a term applied to whatever is expressed by obscure resemblances. The word is chiefly applied to the types and mysteries of the Mosaic law; as also to any expression which is not taken in its primary and literal sense.

FIGURAL, or **FIGURATE NUMBERS**, are such as do or may represent some geometrical figure in relation to which they are always considered, as triangular numbers, pentagonal numbers, pyramidal numbers, &c.

FIGURATE NUMBERS, are distinguished into orders according to their place in the scale of their generation, being all produced one from another, viz. by adding continually the terms of any one, the successive sums are the terms of the next order, beginning from the first order, which is that of equal units 1, 1, 1, &c.; then the 2d order consists of the successive sums of those of the first order, forming the arithmetical progression 1, 2, 3, 4, &c.; those of the 3d order the successive sums of those of the 2d, and are the triangular numbers 1, 3, 6, 10, 15, &c.; those of the 4th order are the successive sums of those of the 3d, and are the pyramidal numbers 1, 4, 10, 20, 35, &c.: and so on, as below.

Order.	Name.	Numbers.
1.	Equals.....	1, 1, 1, 1, 1, &c.
2.	Arithmetical.....	1, 2, 3, 4, 5, &c.
3.	Triangulars.....	1, 3, 6, 10, 15, &c.
4.	Pyramidals.....	1, 4, 10, 20, 35, &c.
5.	2d Pyramidals.....	1, 5, 15, 35, 70, &c.
6.	3d Pyramidals.....	1, 6, 21, 56, 126, &c.
7.	4th Pyramidals.....	1, 7, 28, 84, 210, &c.

The above are all considered as different sorts of triangular numbers, being formed from an arithmetical progression, whose common difference is 1. If n be put for the number of terms in a

series of any order, and from the expression $\frac{n}{1} \times \frac{n+1}{2} \times \frac{n+2}{3} \times \frac{n+3}{4} \times \frac{n+4}{5}$ &c. a number of factors be taken

equal to the number which denotes the order, there will be had the sum of n terms of that order, or, which is the same thing, the n th term of the succeeding order; thus if n be equal to 5, $\frac{5}{1} =$

$5, \frac{5}{1} \times \frac{5+1}{2} = 15, \frac{5}{1} \times \frac{5+1}{2} \times \frac{5+2}{3} = 35$, &c. which

are the sums of 5 terms of the 1, 2, 3, &c. orders, or the 5th term of the 2, 3, 4, &c. orders as in the above table. If the common difference of the generating arithmetical series be 2, the successive sums will be the series of square numbers; if it be 3, the series will be pentagonal numbers, or pentagons; if it be 4, the series will be hexagonal numbers, or hexagons, and so on. Thus:

Arithmetical.	1st. Sums or Polygons.	2d. Sums, or 2d Polygons.
1, 2, 3, 4,	Tri. 1, 3, 6, 10,	1, 4, 10, 20,
1, 3, 5, 7,	Sqrs. 1, 4, 9, 16,	1, 5, 14, 30,
1, 4, 7, 10,	Pent. 1, 5, 12, 22,	1, 6, 18, 40,
1, 5, 9, 13,	Hex. 1, 6, 15, 28,	1, 7, 22, 50, &c.

And the reason of the names triangles, squares, pentagons, hexagons, &c. is, that those numbers may be placed in the form of these regular figures or polygons.

FIGURE, in physics, expresses the surface or terminating extremities of any body; and considered as a property of body affecting our senses, is defined a quality which may be perceived by two of the outward senses. Thus a table is known to be square by the sight and by the touch.

FIGURES, in arithmetic, are certain characters whereby we denote any number which may be expressed by any combination of the nine digits, &c. See **ARITHMETIC**.

FIGURE, in architecture and sculpture, signifies the representation of things made in solid matter, as statues, &c.

FIGURE, in astrology, a description of the disposition of the heavens at a certain hour, in which the places of the planets and stars are marked in a figure of twelve triangles, called houses.

FIGURE, in conic sections, according to Apollonius, is the rectangle made under the latus rectum and transversum in the hyperbola and ellipsis.

FIGURE OF THE DIAMETER; the rectangle under any diameter, and its proper parameter is, in the ellipsis and hyperbola, called the figure of that diameter.

FIGURE, in fortification, the plan of any fortified place, or the interior polygon, which, when the sides and angles are equal, is called a regular, and when unequal, an irregular figure.

FIGURE, in geometry; the superficies included between one or more lines, is denominated either rectilinear, curvilinear, or mixed, according as the extremities are bounded by right lines, curve lines, or both.

FIGURE, in grammar, a deviation from the natural rules of etymology, syntax, and prosody, either for brevity, elegance, or harmony.

FIGURE, in dancing, denotes the several steps which the dancer makes in order and cadence, considered as they mark certain figures on the floor.

FIGURE, in designing and painting, denotes the lines and colours which form the representation of any animal, but more particularly of a human personage. See **PAINTING**, and **DRAWING**.

FIGURE, in logic, denotes a certain order and disposition of the middle term in any syllogism. Figures are fourfold. 1. When the middle term is the subject of the major proposition, and the predicate

predicate of the minor, we have what is called the first figure. 2. When the middle term is the predicate of both the premises, the syllogism is said to be in the second figure. If the middle term is the subject of the two premises, the syllogism is in the third figure; and lastly, by making it the predicate of the major, and subject of the minor, we obtain syllogisms in the fourth figure. Each of these figures has a determinate number of moods, including all the possible ways in which propositions differing in quantity or quality can be combined, according to any disposition of the middle term, in order to arrive at a just conclusion. See LOGIC.

FIGURE, in manufactures, is applied to the various designs represented or wrought on velvets, damasks, taffeties, sattins, and other stuffs and cloths. The most usual figures for such designs are flowers, imitated from the life; or grotesques, and compartments of pure fancy. Representations of men, beasts, birds, and landscapes, have only been introduced since the taste for the Chinese stuffs, particularly those called *sures*, began to prevail. The woof forms the figures; and the warp only serves for the ground.

FIGURE, in rhetoric and poetry, is a manner of speaking different from the ordinary and plain way, and more emphatical; expressing a passion, or containing a beauty. See ALLEGORY, APOSTROPHE, COMPARISON, HYPERBOLE, METAPHOR, ORATORY, PERSONIFICATION, POETRY, &c.

FIGURE IN WHICH THE INSTRUMENT IS CONCEIVED TO BE THE AGENT. When we survey a number of connected objects, that which makes the greatest figure employs chiefly our attention; and the emotion it raises, if lively, prompts us even to exceed nature in the conceptions we form of it. Examples:

For Neleus' son Alcides' rage had slain.
A broken neck the force of Pirus threw.

In these instances, the rage of Hercules and the force of Pirus, being the capital circumstances, are so far exalted as to be conceived the agents that produce the effects. In the first of the following instances hunger being the chief circumstance in the description, is itself imagined to be the patient.

Whose hunger has not tasted food these three days.
JANE SHORE.

—As when the force
Of subterranean wind transports a hill. PAR. LOST.

—As when the potent rod
Of Amram's son, in Egypt's evil day
Wav'd round the coast, upcall'd a pithy cloud
Of locusts. PAR. LOST.

FIGURE, IN WHICH THE PROPERTIES OF ONE OBJECT ARE EXTENDED TO ANOTHER. This figure is not dignified with a proper name, because it has been overlooked by writers. Giddy brink, jovial wine, daring wound, are examples of this figure. Here are adjectives that cannot be made to signify any quality of the substantives to which they are joined: a brink, for example, cannot be termed giddy in a sense, either proper or figurative, that can signify any of its qualities or attributes. When we examine attentively the expression, we discover, that a brink is termed giddy from producing that effect in those who stand on it: in the same manner, a wound is said to be daring, not with respect to itself, but with respect to the boldness of the person who inflicts it; and wine is said to be jovial, as inspiring mirth and jollity. Figures are highly serviceable to clear difficult truths, to make a style pleasant and pathetic, and to awaken and fix attention. But as, in order to obtain these ends, they are to be used with prudence and caution, the following directions ought to be observed. 1. Let the discourse always be founded on nature and sense, supported with strong reason and proof, and then add the ornaments and heightenings of figures; for a man of clear understanding will despise the flourish of figures without sense, and pomp of words that wants truth and substance of things. 2. Be sparing in the use of figures. A passion described in a multitude of words, and carried on to a disproportionate length, fails of the end proposed, and tires instead of pleasing. 3. Figures must not be over adorned, nor affectedly laboured, and ranged into new and scrupulous periods; for by affectation and shew of art, the orator betrays and exposes himself, and it is apparent, that he is

rather ambitious to set off his parts and wit, than to express his sincere concern and passion. This figure can never have any grace, but where the relations are of the most intimate kind.

FIGURES, in theology, mysteries represented under certain types or actions in the Old Testament. Thus manna is held a figure or type of the Lord's supper; and the death of Abel, a figure of the sufferings of Christ. See TYPE.

FIGURES, in the pagan mythology, and antiquities, signify the emblems, enigmas, fables, symbols, and hieroglyphics, of the ancients.

FIGURED, marked with figures. The term is chiefly applied to stuffs, whereon the figures of flowers, and the like, are either wrought or stamped.

FIGURED, in music, is applied either to simple notes or to harmony; to simple notes, as in these words figured bass, to express a bass whose notes carrying chords are subdivided into many other notes of less value; to harmony, when, by supposition and in a diatonic procedure, other notes than those which form the chord are employed. See MUSIC.

FIGWORT. See SCHROPHULARIA.

FILACCIANO, a town of Italy in the patrimony of St. Peter, nine miles S. of Citta Castellana.

FILACER, [*filarius*, low Lat. *filum*,] an officer in the Common Pleas, so called because he files those writs whereon he makes process.

FILAGO, in botany, a genus of the polygamia superflua order, and syngenesia class of plants; natural order, Compositæ. Receptacle naked; no pappus; calyx imbricated; female florets placed among the scales of the calyx. It has seven species.

FILAMENT, in anatomy and natural history, is used in the same sense with fibre. See FIBRE.

FILAMENTS, VEGETABLE, are substances of great use in the arts and manufactures; furnishing thread, cloth, cordage, &c. For these purposes the filamentous parts of the Cannabis and Linum, or Hemp and Flax, are employed. See these articles, and COTTON. But different vegetables have been employed in different countries for the same uses. Putrefaction destroys the pulpy or fleshy matter, and leaves the tough filaments entire. By curiously putrefying the leaf of a plant in water, we may obtain the fine flexible fibres, which constituted the basis of the ribs and minute veins, and which now form as it were a skeleton of the leaf. Alkaline lixiviation, in some degree, produce similar effects to putrefaction. Sieur de Flacourt, in his history of Madagascar, relates, that different kinds of cloth are prepared in that island from the filaments of the bark of certain trees boiled in strong lie; that some of these cloths are very fine, and approach to the softness of silk, but in durability come short of cotton: that others are coarser and stronger, and last thrice as long as cotton; and that of these the sails and cordage of his vessel were made. The Sieur adds, that the stalks of nettles are used for similar purposes in France. And Sir Hans Sloane relates in a letter to Mr. Ray, that he has been informed by several, that muslin and calicoes, and most of the Indian linens, are made of nettles. In some Swedish provinces, a strong kind of cloth is prepared from hop stalks; and in the "Transactions of the Swedish Academy for 1750," there is an account of an experiment made on them. Of the stalks, gathered in autumn, about as many were taken, as equalled in bulk a quantity of flax that would have produced a pound after preparation. The stalks were put into water, and kept there covered during the winter. In March they were taken out, dried in a stove, and dressed as flax. The prepared filaments weighed nearly a pound, and proved fine, soft, and white: they were spun and woven into six ells of fine strong cloth. The author, Mr. Shisler, observes, that hop stalks take much longer time to rot than flax; and that, if not fully rooted, the woody part will not separate, and the cloth will neither prove white nor fine. The filaments of bean stalks have been found to furnish an excellent substitute for hemp. Hemp, flax, and all other vegetable filaments, and thread or cloth prepared from them, differ remarkably from wool, hair, silk, and other animal productions, not only in the principles into which they are resolvable by fire, but likewise in some of their more interesting properties, particularly in their disposition to imbibe colouring matters; sundry liquors, which give a beautiful and durable dye to animal substances, giving no stain at all to vegetables. See DYEING.

FILAMENTS,

FILAMENTS, among botanists, is particularly used for the stamina. See **BOTANY**.

FILANDERS, in entomology and falconry, are worms as small as thread, and about an inch long, that lie wrapt up in a thin skin or net, near the reins of an hawk, apart from either gut or gorge. This malady is known by the hawk's poverty; by her ruffling her tail; by straining the fist, or perch, with her pounces; and, lastly, by croaking in the night, when the filanders prick her. The disease proceeds from bad food; and must be remedied early, to prevent its spreading over the whole body, and destroying the bird.

FILANDERS, in falconry, are also the name of another disease in hawks, &c. consisting of filaments or strings of blood coagulated; and occasioned by a violent rupture of some vein, by which the blood extravasating, hardens into these figures, and incommodates the reins, hips, &c.

FILARIA, in natural history, a genus of the vermes intestinalis class and order. Body round, filiform, equal, and quite smooth; mouth dilated, with a roundish concave lip. There are about 18 species, divided into four sections: viz. A. infesting the mammalia; B. infesting birds; C. infesting insects in their perfect state; D. infesting the larvæ of insects. F. medinensis is found both in the East and West Indies, and is frequent in the morning dew, from which it enters the naked feet of the slaves, and creates the most troublesome itching, frequently accompanied with inflammation and fever.

FILBERT, the fruit of the corylus, or hazel. See **CORYLUS**.

FILE, in law, a record of the court; and the filing of a process of a court makes a record of it. An original writ may be filed after judgement given in the cause, issued forth before; declarations, &c. are to be filed, and affidavits must be filed, some before they are read in court, some immediately after. Before filing a record removed by certiorari, the justices of B. R. may refuse to receive it, if it appears to be for delay, &c.; and remanded back for the expedition of justice; but if the certiorari be once filed, the proceedings below cannot be revived. An indictment, &c. cannot be amended after it is filed.

FILE, in the art of war, is the depth of the battalion or squadron. The files of a battalion of foot are generally three deep; as are sometimes those of a squadron of horse. The files must be straight and parallel one to another.

FILE, a tool employed by smiths and others, for the purpose of smoothing, polishing, or cutting metals. This instrument is of iron, or forged steel, cut in little furrows, with chisels, and a mallet, in a certain direction, and of a certain depth, according to the grain or touch required. After cutting the file, it must be tempered with a composition of chimney soot, very hard and dry, diluted, and wrought up with urine, vinegar, and salt; the whole being reduced to the consistence of mustard. Tempering the files consists in rubbing them over with this composition, and covering them in loam; after which they are put into a charcoal fire, and taken out by the time they have acquired a cherry-colour, which is known by a small rod of the same steel put in along with them. Being taken out of the fire, they are thrown into cold spring-water, and when cold, they are cleaned with charcoal and a rag, and being clean and dry, are kept from rust by laying them up in wheat bran. Iron files require more heating than steel ones. Files are of different forms, sizes, cuts, and degrees of fineness, in proportion to the various uses and occasions for which they are designed; such are the common square, flat, triangular, or round files; the rough-toothed files, which are intended to cut more speedily than any other; and the fine-toothed file, which cuts more slowly, and is appropriated to finer workmanship. The best and most durable instruments of this description are manufactured at Sheffield.

FILIAL PIETY, the affectionate attachment of children to their parents; including in it love, reverence, obedience, and relief. These are duties prompted equally by nature and by gratitude, independent of the injunctions of religion. For where shall we find the person who has received from any one benefits so great or so many, as children from their parents? And it has been justly observed, that those who are undutiful to their parents, seldom prove good to any other religion.

FILICES, [from *filum*, a thread, *quasi filatim incisa*,] **FERNS**; one of the seven tribes or families of the vegetable kingdom. See

BOTANY. They constitute the first order in the class cryptogamia. In Tournefort's Method they are the sixteenth class; and in Ray's the fourth, under the name of Capillares. Haller denominates them Epiphyllasperma, that is, plants that bear their seed on the back of the leaf: others term them Acaules, because they have properly no stem. These plants in figure approach the more perfect vegetables, being furnished, like them, with roots and leaves. The roots creep, and extend themselves horizontally under the earth, throwing out a number of very slender fibres on all sides. The stem in these plants is not to be distinguished from the common foot-stalk, or rather middle rib of the leaves; so that in strict propriety the greater number of ferns may be said to be Acaules, that is, to want the stem altogether: in plants of the second section, however, the middle rib, or a stalk proceeding from the root, overtops the leaves, and forms a stem upon which the flowers are supported. The leaves are winged, or hand-shaped, in all the genera, except in adder's-tongue, pepper-grass, and some species of spleen-wort. The flowers in the greater number of genera are fastened on the back of the leaves; in some they are supported on a stem, which rises above the leaves.

FILICES also constitute a class or order of plants in the natural method. See **BOTANY**.

FILIGRANE, **FILIGREE**, or **FILLAGREE WORK**, [from *filum*, Lat. a thread, and *granum*, a grain,] a kind of enrichment on gold or silver, wrought delicately, in manner of small threads or grains, or both intermixed. In Latin it is called "filatim elaboratum opus, argenteum, aureum." There is no manufacture in any part of the world that has been more admired and celebrated, than the fine gold and silver filigree of Sumatra. And what renders it a matter of greater curiosity is the coarseness of the tools employed in the workmanship, and which, in the hands of an European, would not be thought sufficiently perfect for the most ordinary purposes.

FILING, one of the principal operations in smithery, &c. succeeding to forging. The coarser cut files are always to be succeeded by finer; and in all the kinds the rule is, to lean heavy on the file in thrusting it forward, because the teeth of the file are made to cut forwards. But in drawing the file back again for a second stroke, it is to be lightly lifted just above the work, because it cuts not coming back. See **FILE**.

FILLAGREE WORK. See **FILIGRANE**.

FILLET, or **FILET**, in architecture, a little square member, ornament, or moulding, used in divers places, and upon divers occasions, but generally as a crowning over a greater moulding. See **ARCHITECTURE**. It is the same with what the French call reglet, bande, and bandelette; and the Italians lista or listella.

FILLET, in heraldry, a kind of orle or bordure, containing only a third or fourth part of the breadth of the common bordure. It is supposed to be withdrawn inwards, and is of a different colour from the field. It runs quite round, near the edge, as a lace over a cloak. Fillet is also used for an ordinary drawn like the bar from the sinister point of the chief across the shield, in manner of a scarf; though it is sometimes likewise seen in the situation of a bend, fesse, cross, &c. According to Guillim, the fillet is a fourth part of the chief, and is placed in the chief point of the escutcheon.

FILLET, among painters, gilders, &c. a little reglet of leaf gold, drawn over certain mouldings; or on the edge of frames, pannels, &c. painted white by way of enrichment.

FILLETs, in the manege, are the loins of a horse, which begin at the place where the hinder part of the saddle rests.

FILTER, or **FILTRE**, [*filtrum*, Latin,] in chemistry, &c. a piece of woollen cloth, linen, paper, or other matter, some of which are in form of hollow inverted cones, used to filtrate or strain liquors through. The filtre has the same use and effect with regard to liquids that the sieve or searce has in dry matters. See **FILTRATION**.

FILTER, or **FILTRE**, [from *φιλεω*, of *φιλει*, I love,] is also a charm, supposed to have a virtue of inspiring love. The Greeks, when their love was without success, used several arts to procure the affections of the beloved. The Thessalian women were famous for their skill in this and other magical practices. The means whereby it was affected were of divers sorts; it was sometimes done by potions called *φιλεα*, which are often mentioned both by Greek and Latin authors. Juvenal says,

Ille

Hic magicus affert cantus, hic Thessalia vendit
 Philtra, quibus valeant mentem vexare mariti.

FILTRATION, in chemistry, as well as in domestic economy, is the process of straining or filtering liquors by means of woollen cloth, cotton, linen, paper, or other materials. It deserves to be previously remarked, that in every attempt at purifying fluids in the manner here alluded to, we can divest them only of those foreign ingredients which are mixed with them, and not of such as they hold in solution. The former may be separated from them, by proper filtration; but the latter must be disengaged, either by precipitation or distillation. Although the utility of filtration is thus limited to the noxious particles mixed with liquid bodies, such as foul water, yet it is sufficiently important to deserve some attention. The common filters are of two sorts; namely, simple pieces of paper, or cloth, through which the fluid is passed; or similar materials twisted up in the same manner as skeins or wicks; they are first wetted, then squeezed, and one end put into the vessel, which contains the liquor to be filtered; the other end is to be suspended beneath the surface of the liquor, the purest parts of which drop gradually out of the vessel, leaving behind the coarser particles. These filters, however, are not calculated for domestic use: hence different machines have been invented for the purpose of purifying turbid water. But among these various contrivances, few appear to possess the advantage of simplicity, combined with that of affording an ample supply of a fluid so essentially necessary to the preservation of health. A patent has lately been granted to Mr. James Peacock, of Finsbury-square, for a filtering machine, which is stated to be superior to any hitherto invented. It completely accomplishes the purpose of filtration, by causing the turbid fluid to ascend through a medium of fine gravel, by progressive degrees of fineness, by which means the foulest water or other fluid becomes perfectly freed from all (mixed) impurities, without any noxious mineral quality, which pumice or other common filtering stones are suspected to communicate. Should, from continual use, its operation become in any degree impeded, it may be completely cleansed with the greatest facility in the short space of one minute: an advantage possessed by none of the common machines that operate, by descent. Beside these useful properties, Mr. Peacock's filtering machine does not occupy more room than a large drip-stone with its apparatus, and yields a constant and pure stream of more than 300 gallons in 24 hours. A specimen of this machine is deposited for inspection at Guildhall, London. We shall here recommend a very simple and effectual machine for purifying water. It is on the plan of the celebrated filtering machine, erected at Paris, by means of which the foul water of the river Seine is so completely purified, as to be divested of all its laxative properties; its construction is also simple and easy. When we reflect on the method which nature pursues in the filtration of water, we find that such waters as descend from hills, though passing through sand and rocks, are seldom perfectly pure; but that those are the most limpid, which by ascending, ooze out on the side of a mountain. The cause of this difference appears to be owing to the circumstance, that if the water only descends through sand, the finest and most weighty foreign particles gradually penetrate through the sandy strata; on the contrary, when it is forced to rise through sand, all such ponderous ingredients settle at the bottom; because, from their greater specific gravity, they cannot ascend to the top. The lighter particles of fluids, consequently, in both cases remain in the upper strata of the earth or sand. From these considerations, Professor Parrot, jun. of Paris, was induced to give his filtering machine the form represented in fig. 1, Plate LXX. The principal part of the machinery consists of a square vessel, bent in the form of an inverted syphon. The curve may be circular, elliptic, or in any other direction. This vessel is filled with fine, pure sand, till nearly the height of the dotted line *x, y*, which denotes the ascent of the water to D, whence it flows into the receiver. The part marked A, B, should always project above this line, according to the size of the filtering machine. To A, B, there is attached a woollen bag, which is open at the top, and the lower part of which touches the sand. It serves the purpose of collecting the coarsest impurities, and thus preserves the sand for a longer time from becoming foul. The bag, therefore, may occasionally be removed, and rinsed in clean water. It is evident, that the water flows at A through the bag into the filtre, and rises at the place marked

D, which is considerably lower than the former. It affords a very agreeable sight to observe the most limpid fluid penetrating the uppermost stratum of sand, perfectly similar to that oozing from the purest natural spring. Professor Parrot remarks that he procured a filtering machine made of block-tin, for ascertaining by experiments the purity and quality of water, that may thus be obtained in a given time. It consisted of the following dimensions: the small diameter B, E, was eight Paris inches; the large of the whole machine, eleven inches; consequently the thickness of the vessel A, B, was one inch and a half; the breadth of it, two inches and seven-eighths. The perpendicular height of the lower side, from C, its basis, to the rim D, whence the water issues, was four inches and one-twelfth—the opposite height of the mouth A, B, eight inches and three-fourths; and the height of the sand on the side marked D, was three inches and one-sixth. Although, in experiments of this nature, much depends on the relative size and purity of the sand, which necessarily afford different results, yet Professor Parrot has, after repeated trials, deduced the following conclusions, which appear to be well-founded. 1. That the difference of the niveau, or water-level, has an essential influence on the quantity of the purified water thus obtained; 2. That a prolongation of the stratum of sand does not considerably diminish the product of the filtre, but remarkably contributes to the purity of the fluid. 3. That if the water be forced to pass through the sand with increased velocity, it will be less pure than by allowing it a proper time for its passage; and, 4. That a machine of the dimensions above described, will furnish about three quarts of water in an hour, or eighteen gallons in twenty-four hours. This quantity, however, being too large in proportion to the size of the machine, it is advisable, either to lessen the difference of the water-fall; or, which is still better, to prolong the stratum of sand, in order to reduce the filtration of the water to half the quantity above stated, and to obtain it in greater purity. Thus, a filtering apparatus eighteen inches long from A to D, two inches thick, and four broad, would afford every hour six pints of very pure water. If, therefore, so small a machine, containing a very moderate stratum of sand, and requiring only a difference of two or three inches in the height of the water, furnishes a clear and pure fluid, it follows that an apparatus on a larger scale, provided with a bed of sand from five to six feet long, and admitting of a difference from twelve to eighteen inches in the fall of the water, might be usefully employed in public wells, hydraulic machines, and even in camps, for the supply of an army. In the construction of large filtering machines, Professor Parrot justly observes, that they should not be extended in the direction A, C, D, to a greater length than is absolutely necessary; as, in this case, they will not require any considerable difference in the fall and rise of the water: on the other hand, their breadth and thickness may be accordingly increased. Thus, the diameter of such a machine would still more resemble that of a syphon, as is represented in fig. 2. This form might also be adopted for smaller machines, especially such as are designed for travellers, two of whom might be amply provided with pure water, and in a very short time, by a vessel of the following dimensions: from P to Q, eight inches long; from P to R, twelve inches high; and the whole four inches in breadth. If the form last delineated be employed on an extensive scale, there should be a trap door in the lowermost part marked R, so constructed that it may fit exactly, and admit no passage to the water: this aperture would serve only for the removal of the sand, when it is rendered foul by long use. In the smaller machines, intended for travelling, such a door is unnecessary, as they may be easily emptied of their contents through either of the orifices P, or Q. Instead of this addition to the latter, the upper room, (which in fig. 1, is circumscribed with the letters B, F, E), might serve as a reservoir of pure water, that could either be decanted, or drawn off by means of a cock applied to the centre of the machine, marked F. We think, however, this latter arrangement, which is proposed by M. Parrot, in many respects objectionable, and therefore advise the reader to make use of the more simplified construction. Hence we shall only add, that every filtering machine ought to be provided with a cloth cover, to prevent the dust from rising with the water, without impeding its filtration. The great advantages of filtering machines in the different processes of dyeing, baking, brewing, distilling, and all the domestic arts, is exceedingly evident. As no particle of real nutriment

nutriment can be assimilated to the human fluids, without being previously macerated and reduced by water (whether this fluid be introduced into the stomach, in the form of beer, wine, spirits, tea, &c.) it will be easily understood that impure water cannot fail to produce, however slowly, many dangerous, and often incurable diseases—the source of which is seldom suspected. See WATER.

FIMBRIÆ, or **FRINGES**, a name formerly given to the extremities or borders of the *tubæ Fallopianæ*; the word signifying a fringed border, which that part resembles.

FIMBRIATED, in heraldry, an ordinary with a narrow border, or hem of another tincture.

FIN, [*pinna*,] in natural history, a well known part of fishes, consisting of a membrane supported by rays, or little bony or cartilaginous ossicles. The number, situation, figure, and size, of fins, are different in different fishes. They are found from one to ten, or more; with respect to situation, they stand either on the back only, the belly only, or on both. The office of the fins has commonly been supposed to be analogous to that of wings and feathers in fowls; and to assist the fish in swimming; but later naturalists say this is a mistake. The tail is the great instrument of swimming: the fins only serve to keep the fish upright, and prevent vacillation or wavering. See **ICHTHYOLOGY**.

FINAL CAUSE is the end for which any thing is done. The final cause is the first thing in the intention of a person who does a thing; and the last in the execution. See **CAUSE**.

FINAL LETTERS, among the Hebrew grammarians, five letters so called, because they have a different figure at the end of words from what they have in any other situation.

FINALE, in geography, a sea-port town of Italy, 31 miles S. W. of Genoa.

FINALE, a marquisate of Italy, surrounded by the dominions of Genoa. It is fertile and populous.

FINALE, a town of Italy. It is 18 miles N. N. E. of Modena.

FINANCES, [from *finantz*, Germ. *z. e.* scraping, or usury; or *financia*, low Lat. pecuniary payment,] in the late French policy, denoted the revenues of the king and state: much the same with the treasury or exchequer of the English, and the *fiscus* of the Romans. In general the term is applied to the monies borrowed by government for the purpose of defraying extraordinary expences, and interest of this money is paid out of the amount of the taxes, or by taxes levied for this purpose.

FINCH, in ornithology. See **FRINGILLA**.

FINE, in metallurgy, pure and without mixture, is chiefly used in speaking of gold and silver.

FINE, [*fin*, Cimbr.] a mulct; a pecuniary punishment. The killing of an Irishman was not punished by our law as manslaughter, which is felony and capital; but by a fine or pecuniary punishment, called an *ericke*.—Davies on Ireland.

FINE, in law, has divers applications: as, 1. A formal conveyance of lands or tenements, or of any thing inheritable, being in *esse temporis finis*, in order to cut off all controversies: a final agreement between persons, concerning any lands or rents, &c. of which any suit or writ is depending between them in any court. 3. A sum of money paid for entering lands or tenements let by lease: and, 4. a pecuniary mulct for an offence committed against the king and his laws, or against the lord of the manor.

FINES FOR ALIENATION, in feudal law, one of the attendants or consequences of tenure by vassalship. Knight service, was that of fines due to the lord for every alienation, whenever the tenant had occasion to make his land over to another. This depended on the nature of the feudal connection; it not being reasonable nor allowed, that a feudatory should transfer his lord's gift to another, and substitute a new tenant to do the service in his own stead, without the consent of the lord: and, as the feudal obligation was considered as reciprocal, the lord also could not alienate his seignory without the consent of his tenant, which consent of his was called an *atornment*. This restraint upon the lord soon wore away; that upon the tenant continued longer. For, when every thing came in process of time to be bought and sold, the lords would not grant a licence to their tenants to aliene, without a fine being paid; apprehending that, if it was reasonable for the heir to pay a fine or relief on the renovation of paternal estate, it was much more reasonable that a stranger should make the same acknowledgement on his admission to a newly-purchased feud. In

England, these fines seem only to have been exacted from the king's tenants in capite, who were never able to aliene without a licence: but as to common persons, they were at liberty, by *magna charta*, and the statute of *quia emptores* (if not earlier), to aliene the whole of their estate, to be holden of the same lord as they themselves held it of before. But the king's tenants in capite, not being included under the general words of these statutes, could not aliene without a licence; for if they did, it was in ancient strictness an absolute forfeiture of the land; though some have imagined otherwise. But this severity was mitigated by stat. 1 Edw. III. c. 12, which ordained, that in such case the lands should not be forfeited, but a reasonable fine be paid to the king. Upon which statute it was settled, that one-third of the yearly value should be paid for a licence of alienation; but, if the tenant presumed to aliene without a licence, a full year's value should be paid. These fines were at last totally taken away by stat. 12 Car. II. c. 24.

FINES FOR WRITS, are paid in divers cases for original writs. Thus for every writ of plea of land, if it be not of right patent, which is for the yearly value of five marks; and all original writs in debt and trespass, where the debt or damage is 40*l.* a fine is due to the king of 6*s.* 8*d.* and more proportionably when any writ is for things of greater value.

FINECHOLARO, a small island of France, near the N. E. coast of Corsica, 7 miles N. of Bastia.

FINE-DRAWING, or **RENTING**. See **RENTING**. It is prohibited to fine-draw pieces of foreign manufacture upon those of our own, as has formerly been practised.

FINERS, or **REFINERS OF GOLD AND SILVER**, persons who purify and part those metals from coarser ones by fire and acids. They are also called *parters* in our old law-books, and sometimes *departers*.

FINERY, or **FINARY**, in the iron work, one of the forges at which iron is hammered and fashioned into what they call a bloom or square bar.

FINESSE, [French,] signifies literally the same with the English word fineness; but among us it is chiefly used to denote that kind of subtilty used for the purposes of deception. It is likewise used for that peculiar delicacy perceived in works of the mind, and the nicest and most secret and sublime parts of any science or art.

FINE-STILLING, that branch of the art of distilling, which is employed in distilling the spirit from treacle, or other preparations or recrements of sugar. It is so called by way of distinction from malt-stilling. This operation is the same with that used in making the maltspirit; a wash of the saccharine matter being made with water from treacle, &c. and fermented with yeast. It is usual to add in this case, however, a considerable portion of malt, and sometimes powdered jalap, to the fermenting backs. The malt accelerates the fermentation, and makes the spirit come out the cheaper, and the jalap prevents the rise of any musty head to the surface of the fermenting liquor, so as to leave a greater opportunity for the free access of the air, and thus to shorten the work, by turning the foamy into a hissing fermentation.

FINGAL, king of Morven, in ancient Caledonia. He flourished in the third century; and according to the Irish histories died A. D. 283, although there is some reason from Ossian's Poems for placing his death a few years later. Fingal was descended in all probability from those Celtic tribes who were the first inhabitants of Britain. Tradition, and the poems of Ossian, give him a long line of royal ancestors, such as Combal, Trenmore, Trathal, &c. who had all reigned over the same territory. Whether this territory was bounded by the Caledonian forest, or extended somewhat farther south towards the Roman province, is uncertain; but it doubtless extended over all the north and west Highlands, comprehending the Hebrides, whose petty chiefs were all subject to the king of Morven. His principal place of residence was Selma, which was probably in the neighbourhood of Glenco, supposed to be the Cona of Ossian; though some imagine it to have been in Strath-Conan in Moray. The truth seems to be, that as Fingal and his people lived by hunting, they often shifted their habitation. Hence in all parts of the Highlands we find, in the names of places, buildings, &c. such monuments as justify their several claims for the honour of Fingal's residence. Fingal acquired great fame by his prowess in arms. He made many successful incursions into the Roman province, from whence he

carried away those spoils which his son so often mentions, under the names of the wine of the stranger, and the wax of the stranger. By sea we find him frequently making voyages to Scandinavia, the Orkneys, and Ireland; called by Ossian Lochlin, Innistore, and Ullin.

FINGERS, [*digiti*, Lat.] in anatomy, the extreme part of the hand divided into five members. The names of the fingers, reckoning from the thumb, are, 1. Pollex: 2. Index: 3. Medius: 4. Annularis: 5. Auricularis. In each of these there are three bones, which make three phalanges, the upper of which are much larger than the lower. See **ANATOMY**.

FINING OF LIQUORS. See **CLARIFICATION**.

FINISH, an island on the west coast of Ireland, a mile E. of Minishland.

FINISHING, in architecture, is frequently used for crowning, acroter, &c. raised over a piece of building, to terminate, complete, or finish it.

FINISTERRE, [*Lat. finis terra, i. e. land's end*,] a department of France, bounded on the N.W. and S. by the sea, and on the E. by the departments of the north coasts and Morbihan. It comprehends the west part of the late province of Bretagne.

FINISTERRE, or **FINISTERRA**, a town of Spain in Galicia, near the Cape.

FINISTERRE, CAPE, the most western promontory of Spain and of all Europe. Lon. 9. 12. W. Lat. 42. 52. N.

FINITE, [*finitus*, Lat.] something bounded or limited, in contradistinction to infinite. See **INFINITE**. The schools distinguish finite into two kinds, viz. finite in perfection, and finite in extension. See **PERFECTION** and **EXTENSION**.

FINITE IN PERFECTION, is applied to things which have not all possible perfection, but such only as may be comprehended by the mind. Thus the world, though supposed by the Cartesians infinite in point of extension, is yet finite in point of essence or perfection. In order to arrive at an idea of a thing finite in perfection, we must first conceive the thing as having certain perfections, and then conceive some other perfections which it has not; or some perfections in a greater degree. Thus when I say that there is a finite number, I first conceive a number consisting of three units, then conceive other units beyond these three. I conceive my mind to be finite, by observing certain perfections beyond those I find in my mind.

FINITE IN EXTENSION, is applied to things which have not all possible or conceivable extension. To arrive at an idea of a thing finite in extension, we must first conceive the thing as having a certain extension, and then conceive some other extension which it has not; thus I conceive a room to be finite in extension, by having an idea of extension beyond what is contained therein.

FINITO, in music, a canon or fugue is said to be finito, when it is not perpetual, but when, at some certain place, all the parts join or unite, after having followed one another for a certain time.

FINITOR, in astronomy, the same with horizon, so called because it terminates the sight or prospect. See **HORIZON**.

FINKENSTEIN, a town of Germany, in Carinthia, 16 miles S.W. of Clagenfurt.

FINKENSTEIN, or **HABERSDORF**, a town of Prussia, in Oberland, 75 miles S.S.W. of Königsberg.

FINLAND, or **FINNLAND**, a country of Europe, bounded on the north by Lapland, on the east by Russia, on the south by a gulf to which it gives name, and on the west by the gulf of Bothnia. The land is fertile, but badly cultivated, and thinly inhabited. On a tract of more than eight thousand square leagues, hardly a million of souls are to be found. The pastures are exceedingly good, but the cattle are small. The forests of firs furnish the principal articles of commerce, in wood, charcoal, timber, and planks, which are sent to Stockholm for exportation. Game is abundant of various kinds. The lakes and rivers abound in variety of fish, and pearls are found on the coasts. At the bottom of the morasses earth is dug, from which iron is extracted. There are also some mines of lead. Along the coasts lie a great number of small rocky islands. The inhabitants are in general brave and warlike, but have suffered much from the ravages of war. The corn principally cultivated is rye, barley, and buck wheat; the poorer sort of inhabitants, for want of better food, dry even straw, braise and mix it with some meal to make bread. Finland is divided into seven provinces, Finland Proper, Aaland,

East Bothnia, Tavastia, or Tavastland, Nyland, Savolax, and Kymmenegards Lehn. The religion is Lutheranism.

FINLAND PROPER, a province of Sweden, situated on the southern part of Finland. Abo is the capital.

FINLAND, RUSSIAN. See **CARELIA**, **KEXHOLM**, and **WIBURGH**.

FINMARK, a province of Norway, bounded on the north by the northern ocean, on the east by the northern ocean and the territories of Russia, on the south by Swedish Lapland, and on the west by the northern ocean. It has neither towns nor villages, though the coast is pretty well inhabited. The inhabitants subsist chiefly by fishing, and the best salmon of any in Norway are caught in this province.

FINNI, or **FENNI**, the ancient people of Finningia, "whose ferocity (says Tacitus) was extraordinary, poverty extreme, herbs their food, skins their covering, and the ground their couch: regardless of man and of gods, they attained to a very difficult thing, not to have a single wish to form."

FINNINGIA, or **FENNINGIA**, in ancient geography, the proper reading, for Eningia in Pliny, which he makes an island, but is more truly a peninsula: now called Finland.

FINNIS BAY, a bay of Scotland, on the east coast of the island of Harris.

FINNS, the people of Finland. See **FINNI**.

FINO, a small island in the Baltic, near the east coast of Sweden. Lon. 16. 42. E. Lat. 58. 9. N.

FINOW, a town of Germany, in the late circle of Upper Saxony, and Ucker Mark of Brandenburg, 32 miles N.E. of Berlin.

FIR, or **FIR-TREE**. See **PINUS**.

FIR CLUB MOSS. See **LYCOPODIUM**.

FIRE, in chemistry, that subtle invisible substance by which bodies are expanded or enlarged in bulk, and become hot to the touch; fluids are rarefied into vapour; solid bodies become fluid, and in like manner are at last dissipated, or, if incapable of being carried off in vapour, are at length melted into glass. It is now denominated caloric, or the matter of heat. See **CALORIC**.

FIRE, in theology. See **HELL**. We read of the sacred fire in the first temple of Jerusalem, which came down from heaven: it was kept with the utmost care, and the Jews were forbidden to carry any strange fire into the temple. This fire is one of the five things which the Jews confess were wanting in the second temple.

FIRE, in the Pagan mythology. Fire was the supreme god of the Chaldeans; and the Persian Magi were worshippers of fire.

FIRE, BALLS OF. See **BALLS OF FIRE**, and **ÆROLITHS**.

FIRE, THE EXTINGUISHING OF. Though designed to be subservient to the most useful purposes, fire frequently becomes a scourge to mankind; and, unless it be timely discovered, lays whole streets and towns in ashes. Hence the securing of houses and other buildings against this devouring element, has ever formed an important object of inquiry, while it has exercised the ingenuity of intelligent men; we shall briefly state a few of the most remarkable experiments, together with the result or success which has attended them. Dr. Hales first proposed a plan of covering the floors of houses with earth. The thicker the mould is laid on the floors the greater is the security. He supposes that the depth of an inch will be amply sufficient; though he recommends to lay a deeper coat on the stairs; because fire, in general, ascends by means of stair-cases with the greatest velocity. M. Hartley made several trials in 1775 and 1776, to evince the efficacy of a method which he had invented for restraining the spreading of fire in buildings. For this purpose thin iron plates are well nailed to the tops of the joists, &c. the edges of the sides and ends being lapped over, folded together, and hammered close. Partitions, stairs, and floors, may be defended in the same manner; and plates applied to one side have been found sufficient. The plates are so thin as not to prevent the floor from being nailed on the joists, in the same manner as if this preventive were not used: they are kept from rust by being painted or varnished with oil and turpentine. The expence of this addition, when extending through a whole building, is estimated at about 5 per cent. Mr. Hartley got a patent for this invention, and parliament voted a sum of money towards defraying the expence of his numerous experiments. The same preservative may also be applied to ships, furniture, &c. Lord Mahon has likewise invented a very simple

simple and effectual mode of securing every kind of building against all danger of fire: he divides it into three parts, namely, under-flooring, extra-lathing, and inter-securing. The first part or method is either single or double. In single underflooring, a common strong lath, one quarter of an inch thick, should be nailed against each side of every joist and main timber, supporting the floor which is to be secured. Similar laths are then to be nailed on the whole length of the joists, the ends of which abut against each other. The top of each lath or fillet, ought to be an inch and a half below the top of the joists or timbers, against which they are nailed, so as to form a small ledge on every side. When these fillets are nailed on, they should be laid in a rough plaster, which should be laid on the tops of such fillets, so as to leave no vacant space between them and the joists. Short pieces of common laths are next to be nailed closely together, in a direction contrary to that of the joists; the ends of the former are to rest on the fillets, and to be well bedded in rough plaster, but not fastened with nails. They are next to be coated once with the plaster, which is to be spread over them to the tops of the joists. In double-flooring, the fillets and short pieces of laths are applied in the manner already described; the coat of rough plaster ought, however, in this method, to be somewhat more than half as thick as that in single-flooring. While the rough plaster is laying on, some additional short pieces of laths are to be inserted between the joists upon the first coat, as closely to each other as possible, and in the same direction as the first layer of laths. Over this second layer of short laths, another coat of rough plaster should be spread, which ought to be trowelled level with the tops of the joists. As soon as the plaster-work between the joists is perfectly dry, it should be inspected, in order to ascertain whether there be any small cracks, especially next to the joists. Should any occur, it will be requisite to close them, by washing them over with a brush wetted with mortar-wash, which may be prepared by mixing two measures of quick-lime and one of sand in a pail, and tempering the whole with water till it acquires the consistence of a thick jelly. Previously to laying down the flooring-boards, a small quantity of dry common sand should be strewn over the plaster work, and struck smooth with a hollow rule in the same direction as the joists are laid, so that it may lie rounding between each pair of joists. Particular attention should be paid to the plaster-work and sand, that they be perfectly dry before the boards are laid, lest the latter become infected with the dry-rot. The mode of under-flooring may be successfully applied to a wooden stair-case; but no sand is then to be laid upon the plaster-work. The methods of extra-lathing may be practised on ceiling-joists, sloping-roofs, and wooden partitions. The third method, namely, inter-securing, is similar to that of under-flooring; but no sand is afterwards to be laid over it. Inter-securing is applicable to the same parts of a building as the method of extra-lathing; but it is seldom necessary to be employed. Lord Mahon made several experiments, which shew the utility of this invention; but we can only refer the inquisitive reader to the sixty-eighth volume of the Philosophical Transactions of the Royal Society," for 1778; where he will find a satisfactory account of the manner of preparing the mortar, as well as the result of numerous trials made by the inventor. See also ARCHITECTURE and FIRE-PROOF. The most expeditious way of extinguishing fire is a matter of equal importance, as the security of buildings from that destructive agent. Hence various machines, and chemical preparations, have been invented by ingenious men, in order to promote so useful an object; one of the earliest contrivances was a barrel filled with certain ingredients, first proposed by M. Fughs, a German physician, in the year 1734; and which effectually answered the purpose for which it was designed. A similar invention was introduced into this country by a Mr. Zachary Grey, whose machines were made of wood, and contained only water; they were exhibited before several of the nobility, but it did not meet with encouragement. In the year 1761, Dr. Godfrey produced certain vessels which in every respect succeeded. They are supposed to have been an improvement on Mr. Grey's, were constructed with wood, and filled with a chemical liquor, consisting of water, oil of vitriol, and sal-ammoniac. When thrown into rooms and other places that were purposely set on fire, they burst, and by their explosion completely extinguished the flames: it is to be observed, that they were useless after the roof had fallen in. These contrivances,

however, are evidently more calculated for ships, than to be employed on land; as they would be of great service for suppressing fires in vessels at sea, and might be considered as necessary a part of their cargo as naval stores, or ammunition. In the twenty-third volume of Annals of Agriculture, Mr. William Knox, a merchant of Gothenburg, in Sweden, states that he had made a variety of experiments for extinguishing fire by means of such substances as are cheap and easily procured. He divides them into simple and compound solutions. In the former class, he proposes to add to seventy-five gallons of water nine gallons of the strongest solution of wood-ashes; or six gallons of the finest pulverized pot-ashes; or eight gallons and a half of common salt well dried, and finely beaten; or eight gallons and a half of green vitriol or coppers, thoroughly dried, and finely pulverized; or eleven gallons and a quarter of the strongest herring pickle; or nine gallons alum reduced to powder; or nineteen gallons of clay, perfectly dried, well beaten, and carefully sifted. Among the compound solutions, Mr. Knox recommends to mix seventy-five gallons of water with ten quarts of clay, ten quarts of vitriol, and ten quarts of common salt; or a similar quantity of water, with eighteen quarts of the strongest solution of wood-ashes and eighteen quarts of fine clay reduced to powder; or the same proportion of water, with fifteen quarts of red-ochre, or the residuum of aquafortis, and fifteen quarts of common salt; or, lastly, to mix fifteen quarts of the strongest herring-pickle, and fifteen quarts of red-ochre, with seventy-five gallons of water. All these different solutions, Mr. Knox remarks, are equally efficacious in extinguishing fire; but he prefers the compounds, as being the "surest and most powerful for that purpose." Another of the various inventions for extinguishing fire by chemical means, deserving of notice, is the composition prepared by M. Von Aken, and which consists of the following ingredients:

	<i>lbs.</i>
Burnt alum.....	30
Green vitriol in powder.....	40
Cinabrese, or red-ochre, pulverized.....	20
Potters, or other clay, finely pounded and sifted.....	200
Water.....	630

With 40 measures of this liquor an artificial fire, which would have required the labour of twenty men, and 1500 measures of common water, was extinguished, under the direction of the inventor, by three persons. The price of this compound solution is estimated at one halfpenny per pound.

FIRE, WATER ENGINES FOR EXTINGUISHING. These are either forcing or lifting pumps; and as they are made to move with great velocity, their execution principally depends on the length of their levers, and the force with which they are worked. Various engines have been contrived, from which we have selected the following, as they are the most ingenious, and at the same time calculated to produce the greatest effects. In the year 1785, the silver medal and twenty guineas were conferred by the "Society for the Encouragement of Arts," &c. on Mr. Furst, as a reward for his contrivance to increase the effect of engines in extinguishing fires; of which the following is a short description: from a platform rises an upright pole or mast, of such height as may be judged necessary; a gaff slides upon it in an ascending direction, and along both is conveyed the leather hose from the engine. The branch, or nose-pipe of the engine, projects at the extremity of the gaff; towards which an iron frame is fixed, whence two chains are suspended; and from these hang ropes, which serve to give an horizontal direction to the branch; while other ropes, that run through proper pulleys, and are thus conveyed down the mast, serve likewise to communicate a vertical motion to it. By these means, the branch or nose-pipe of the engine is conducted into the window of any room where the fire more immediately rages; and the effect of the water discharged is applied in the most efficacious manner to the extinguishing of the flames. A patent was granted in January 1790, to Mr. Joseph Braham, of Piccadilly, and to Mr. Thomas Dickenson, of Bedworth Close, in the county of Warwick, for a new improved engine on a rotative principle. The merits of this machine depend on its having two wheels or cylinders of brass, or any other metal; one of which is of a greater, and the other of a smaller diameter, in any proportion required; both are nearly of equal length, but may be increased

or decreased, according to the purpose to which the machine is applied. As soon as the larger wheel is fixed, the smaller one is placed within it, and is fastened on an axis, so as to turn in a rotative direction round its centre; the smaller wheel being thus stationed, may be occasionally fixed, and the larger one moved in the same direction round the smaller one: the former of these, however, is preferable in all cases. At each end of the larger wheel there is a flanch, to which are screwed two plates, or caps inclosing its ends, and into which the extremities of the smaller wheel are inserted, so as to render the junction water-tight: through these caps passes the axis of the inner cylinder, in order to communicate motion from without. Or the inner wheel may be applied so as to give motion, by its external end or ends, to any other engine or machine connected with it. These are the component parts of Messrs. Brahan's and Dickenson's patent engines; for a more particular account of which, we refer the reader to the 2d vol. of the Repertory of Arts and Manufactures, where he will find a minute account of the machinery, and the effects it is calculated to produce. A patent was likewise granted in December 1792, to Mr. Charles Simpkin, of Oxford-street, engine-maker; for his improvements in all kinds of machines for extinguishing fire. This invention consists in exploding or removing the valves both from that part of the cylinder, where the vacuum is made by the piston or fly, and from beneath the air-vessel; and in making use of valves, by the application of certain filtering chambers, with partitions or divisions, to preserve the effect of the valves, during the use of any improper fluid. These filtering chambers are to be placed between the drawing valves, and the strainer in common use, on the suction-pipe. The partitions in the chambers may be of fine wire-work, or of any other substitute, that will act as a first and second filtration in the chamber. The design of this invention is, to render the valves more free of access, and to prevent the necessity of opening any other parts of the engine, except the chambers containing the valves; by which means the effect of the machine is increased, and consequently the fire may be more easily extinguished. To these different contrivances we shall add the American fire engine, of which we have given an accurate engraving. It was invented by Mr. Benjamin Dearborn, who communicated it to the American Academy of Arts and Sciences, from whose Memoirs for 1794, we extract the following description. In fig. 3, Plate LXX, AB, and C D, are the edges of two planks, confined together by four bolts.—*a b*, and *c d*, are two cylindrical barrels, in each of which a piston, with a valve, is fastened to the spear *e*, and is moved up and down alternately by the motion of the arms E E. Beneath each barrel a hole is made through the plank AB, which is covered with a valve. The arms E E, are suspended on the common centre *f*; there are also arms parallel to these on the opposite side; *g g* are the ends of handles which are fastened across the ends of the arms. At *h*, a bolt goes across, from arm to arm, to which the piece *i k*, is affixed, and on which it plays; the lower end of this piece is fastened to the top of the spear *e*.—*G, l, f*, is a standard for the purpose of supporting the arms, to which there is a correspondent one on the opposite side; both are notched into the edges of the planks, where they are secured by a bolt, which passes through them at *l*, and has a nut or fore-lock on the opposite side. H I, H I, are square braces, answering the purpose of ducts, through which the water ascends from the barrels, passing through the plank at *m*. K L, K L, are irons in the form of a staple, in order to confine the braces: the lower ends of these irons meet, and are secured by a bolt passing through them, and M N, *n o*, which is a piece that goes up through a mortice in the centre of the planks. This piece is square from the lower end, till it reaches the top of the braces; whence they become cylindrical to the top, the upper end being perforated sufficiently low down, in order to communicate with the braces. O, P, is an iron ring, that surrounds the tube, and has two shanks which ascend through the head, which screws on the top at *p*, *q*:—*r, s*, is a ferule, nailed round the tube. Fig. 4, is the same engine; the arms and standards being taken off, in order to delineate more clearly the mode of securing the braces; an object which is completely effected by a wedge driven into the mortice *u*: beneath the upper plank *b*, is a hole for admitting a passage to the bolt, which secures the standards. In this figure, a side-view of the head is given, with the pipe in a perpendicular direction. The

machine is confined within a box, set on wheels, as in the common fire-engines. The whole is made of wood, excepting the spears of the pumps, and a few bolts, &c. The advantages of this machine are, that it can be made in any place where common pumps are manufactured; the interior work will not exceed one-fourth of the price of those which are constructed on the usual plan; and that they are incomparably more easy to work, than the common ones; circumstances which strongly recommended the American fire-engine to the attention of the public. The fire-engine is in all cases, a very ineffectual machine, where it cannot supply a very large quantity of water in proportion to the fire to be extinguished. On the breaking out of a fire, all constables are enjoined, by several acts of parliament, to repair to the place; to use every exertion for extinguishing the flames; and to cause the people to work, &c. By the 10 Ann. c. 14, no action shall be commenced against any person in whose house or chamber a fire shall break out accidentally; but, if such fire happen through the negligence of any servant, the latter incurs a penalty of 100*l*. to be distributed among the sufferers; and in default of payment, he is to be imprisoned for 18 months, during which time he is to be kept to hard labour. The wilful setting of fire to any house, out-house, or other building, is felony without benefit of clergy.

FIRE-ARMS are those which are charged with powder and ball; such as musquets, carbines, pistols, cannons, &c. In December 1780, a patent was granted to Mr. John Aitken, of Edinburgh, surgeon, for his invention of a new method of loading fire-arms, of whatever dimensions or forms, with two or more charges of powder and ball, and of discharging them in succession, by fire communicated through correspondent perforations, or touch-holes. This consists in lodging several charges of powder and shot in the fire-arms, whether cylindrical, conical, chambered, or otherwise; the hindmost extremity, or breech, being closed, while the anterior one, or muzzle, is open. The extension of the fire, in a posterior direction from the charge next the muzzle that is first inflamed, is intercepted by intermedia placed between the several charges, which are firmly rammed about or above the shot; and which are formed of any substance that possesses sufficient resistance, is compact, incombustible, and properly shaped. In the smaller fire-arms, namely pistols, musquets, blunderbusses, &c. the patentee chiefly employs leather, or other thick stuffs. In the larger ones, such as cannons, mortars, &c. he makes use of various pastes, as being more commodious, and more easily procured. The charges are ignited through touch-holes by the lock, or match, as occasion may demand, according to the size and condition of the tube.

FIRE-ARROW, in naval artillery, is a small iron dart furnished with springs and bars, together with a match impregnated with sulphur and powder, which is wound about its shaft. It is intended to fire the sails of the enemy, and it is for this purpose discharged from a musquetoon or swivel gun. The match being kindled by the explosion, communicates the flame to the sail against which it is directed, where the arrow is fastened by means of its bars and springs. This weapon is peculiar to hot climates, particularly the West Indies, where the sails being extremely dry by reason of the great heats, they instantly take fire, and of course set fire to the rigging, masts, and vessel.

FIRE-BALL, in artillery, a composition of powder, sulphur, salt-petre, pitch, &c. about the bigness of a hand-grenade, coated over with flax, and primed with the slow composition of a fuze. This is to be thrown into the enemy's works in the night-time, to discover where they are; or to fire houses, galleries, or blinds of the besiegers; but they are then armed with spikes or hooks of iron, that they roll not off, but stick or hang where they are desired to have any effect. See BALL.

FIRE-EATER. A great number of mountebanks have attracted the attention and wonder of the public by eating fire, walking on fire, washing their hands in melted lead, and the like tricks. The most celebrated of these was our countryman Richardson, much talked of abroad. His secret, as related in the Journal des Scavans, of 1680, consisted in a pure spirit of sulphur, wherewith he rubbed his hands, and the parts that were to touch the fire; which burning and cauterizing the epidermis, hardened and enabled the skin to resist the fire. Indeed this is no new thing: Amb. Pare assures us that he had tried it on himself: that after washing the hands in urine, and with an unguentum aureum, one

may safely wash them in melted lead. He adds, that by washing his hands in the juice of onions, he could bear a hot shovel on them while it melted lead.

FIRE-COCKS, are contrivances for admitting water into pipes or reservoirs; churchwardens in London, and within the bills of mortality, are enjoined to fix them at proper distances in streets, together with painted characters on the opposite wall, pointing out such distance. They are also ordered to deposit in every house thus marked, an instrument or key for opening a plug, and likewise a large engine, and an hand-engine, under the penalty of ten pounds.

FIRE-ENGINE. See **STEAM-ENGINE.**

FIRE-ESCAPE, a contrivance for the purpose of rescuing persons in imminent danger from fire. In the Annual Register for 1775, an account is given of a machine for saving persons and effects from the flames. It consists, 1. Of a pole of fir, which may be of any convenient length, being about five inches in diameter at the bottom, and at the top or smallest end, about three inches. At the distance of three feet from the top, is a mortice through the pole, to which a pulley is fixed, that is nearly of the same diameter as that part of the pole. 2. A rope about three-fourths of an inch in diameter, and twice the length of the pole, at one end of which is a spring-hook, to pass through the handle of the basket, when used; it is put through the mortice over the pulley, and drawn tight on each side, nearly to the bottom of the pole, where it is secured till wanted. 3. A basket which ought to be of strong wicker-work, three and a half feet long, two and half feet wide, rounded off at the corners; and four feet deep, rounding every way at the bottom. To the top of the basket is fixed a strong iron curve, or handle, with an eye or ring in the middle: a small cord about the length of the pole, is likewise fastened to one side of the basket, near the top. These being the principal parts, there are also several straps, &c. for securing the poles from sliding; of which the reader will find a minute account in the volume before quoted. This contrivance can be raised, and two or more persons may be taken out of the upper windows of a house, and let down safely in the street, within the space of thirty-five seconds, or in little more than half a minute. We cannot on this occasion, omit to point out the great utility of those fringed ropes which should be fastened to the foot of a bedstead, and extend to a sufficient length, to descend by them, in case of fire, through a window: they are sold by several rope-manufacturers in town, generally at two shillings per yard.

FIRE-PLACE, a contrivance for communicating heat to rooms, and also for answering various purposes of art and manufacture. See **FURNACE** and **STOVE**. In the construction of fire-places for domestic purposes, the chief object is the saving of fuel: with this intention, several ingenious artists have invented different kinds of grates, more or less adapted to that useful end. The fire-places in general use are, 1. The large open ones, which were commonly adopted in former times, and are still retained in the country, and in kitchens: they require a wide funnel, consume a great quantity of fuel, and generally smoke, unless the door, or a window, be left open. 2. The modern fire-places generally adopted in towns, are constructed with low breasts and hearths, narrowed by jambs. These being more contracted than the antiquated chimnies, easily keep the room free from smoke; but the funnel necessarily occasions a considerable draught of air, which rushing in at every crevice, renders the situation of those who are exposed to it very uncomfortable, and even dangerous: for it is unquestionable, that most of the diseases that proceed from colds may be justly attributed to the strong draught of chimnies, by which, in severe weather, persons are scorched before, while they are freezing behind. Such fire-places, therefore, are of little service in heating rooms, as the surrounding air, which is warmed by the direct rays of the fire, does not remain in the apartment, but is continually collected in the chimney, by the current of cold air which surrounds it, and by which it is in a short time carried off. Nor is this the only inconvenience attendant on such improper contrivances; for the greatest part of the fire is lost, in consequence of its being absorbed by the back, jambs, and hearth, which are dark and obscure, and reflect very little, so that the heat flies directly up the chimney. 3. To remedy this inconvenience, an ingenious Frenchman, named Gauger, in the year 1709, proposed seven different constructions of a new kind of chimnies, in which there are hollow cavities, formed by means of iron plates

inserted in the back, jambs, and hearth; through these the heat passes and warms the air in those cavities, which is thus continually communicated to the room. Although many advantages arise from this arrangement, yet the expence necessarily incurred, must ever be an insuperable obstacle to its general adoption. 4. Another kind of fire-place is the Holland iron-stove, which has a flue proceeding from the top, and a small iron door that opens into the apartment. They serve to warm a room, lessen the consumption of fuel, and to produce a constant change of air; but, as the fire is too much confined, it is neither sufficiently cheerful, nor calculated for culinary purposes, and is therefore employed chiefly in work-shops. 5. The German stove consists of five iron plates, which are screwed closely together in such a manner, that the fuel may be put into it from another room, and even from the outside of the house. This stove warms rooms with little fuel, and is not attended with any danger from the irruption of cold air; but it admits of no change or draught of air in the room, and the fire is likewise concealed. Such are the inconveniences attending the fire-places in general use; and, though we by no means wish to depreciate the inventions of Count Rumford, yet we are of opinion that the Pennsylvania fire-place, which was originally contrived by Dr. Franklin, is eminently adapted to domestic purposes, both for its economy in the consumption of fuel, and on account of its efficacious mode of imparting heat. From these considerations, we have been induced to present the reader with some account of this machine, which consists: 1. Of a bottom plate or hearth-piece, as shewn in the figure, with a rising moulding in front, for a fender. See Plate LXX. fig. 5. At the sides are attached two perforated ears, F, G, for receiving two screw-rods; a long air-hole *aa*, through which the outward air passes into the air-box; and three smoke-holes represented by the dark squares in BC, through which the smoke descends and passes away; besides, double ledges for receiving between them the lower edges of the other plates. 2. A back plate without holes, and furnished with a pair of ledges to receive. 3. The two side plates, each of which has a pair of ledges to receive the side-edges of the front plate, with a shoulder on which it rests two pair of ledges to receive the side edges of the two middle plates which form the air-box, and an oblong air-hole near the top, through which the air warmed in the box is discharged into the room, and a wing or bracket as H, and a small hole as R, for the axis of the register to turn in. See fig. 6, which represents one of these plates. 4. An air-box, composed of the two middle plates DE and FG, fig. 7 and 8. The first has five thin ledges or partitions cast on it, the edges of which are received into so many pair of ledges cast in the other: the tops of all the cavities formed by these thin deep ledges are also covered by a ledge of the same form and depth cast with them; so that when the plates are put together, and the joints luted, there is no communication between the air-box and the smoke. In the winding passages of this box, fresh air is warmed as it passes into the room. 5. A front plate, which is arched on the under side, and ornamented with foliages, &c. 6. A top plate, with a pair of ears M, N, fig. 9, answerable to those in the bottom plate, and perforated for the same purpose. It has also a pair of ledges running round the under side to receive the top edges of the front, back, and side plates. The air-box does not reach up to the top plate by $2\frac{1}{2}$ inches. All these plates are of cast iron; and when they are all in their proper places, they are bound firmly together by a pair of slender rods of wrought iron with screws, and the machine appears as in fig. 9. There are also two thin plates of wrought iron, viz, 7. The shutter, which is of such a length and breadth as to close well the opening of the fire-place, and serves to blow up the fire, and to secure it in the night. It is raised or depressed by means of two brass knobs, and slides in a groove left between the foremost ledge of the side plates and the face of the front plate. 8. The register, which is placed between the back plate and air box, and furnished with a key; so that it may be turned on its axis, and made to lie in any position between level and upright. The operation of this machine, and the method of fixing it, may be understood by observing the profile of the chimney and fire-places in fig. 10. M is the mantle piece or breast of the chimney; C the funnel; B the false back, made of brick work in the chimney, four inches or more from the true back, from the top of which a closing is made over to the breast of the chimney, that no air may pass into the chimney except that which goes under the false back, and up behind it; T

the true back of the chimney; E the top of the fire-place; F the front of it; A the place where the fire is made; D the air-box; K the hole in the side plate, through which the warmed air is discharged out of the air-box into the room; H the hollow, formed by removing some bricks from the hearth under the bottom plate filled with fresh air, entering at the passage I, and ascending into the air-box through the air-hole in the bottom plate near G, the partition in the hollow, designed to keep the air and smoke apart; P the passage under the false back, and part of the hearth for the smoke. The arrows shew the course of the smoke. The fire being made at A, the flame and smoke will ascend, strike the top T, and give it a considerable heat; the smoke will turn over the air-box, and descend between it and the back plate to the holes near G in the bottom plate, heating in its passages all the plates of the machine; it will then proceed under and behind the false back, and rise into the chimney. The air of the room contiguous to the several plates, and warmed by them, becomes specifically lighter than the other air in the room, and is obliged to rise; but being prevented by the closure over the fire-place from going up the chimney, is forced out into the room, and rising by the mantle-piece to the ceiling, is again driven down gradually by the steam of newly warmed air that follows: and thus the whole room becomes in a little time equally warmed. The air also, warmed under the bottom plate and in the air-box, rises and comes out of the holes in the side plates, thus warming and continually changing the air of the room. In the closing of the chimney a square opening for a trap door should be left for the sweeper to go up: the door may be made of slate or tin, and so placed, that by turning up against the back of the chimney when open, it closes the vacancy behind the false back, and shoots the soot that falls in sweeping out upon the hearth. It will also be convenient to have a small hole, about five or six inches square, cut near the ceiling through into the funnel, and provided with a shutter; by occasionally opening which, the heated air of the room and smoke of tobacco, &c. may be carried off without incommoding the company. For a further account of the manner of fixing and using this fire-place, see Franklin's Letters and Papers on Philosophical Subjects, p. 284—318, edit. 1769.

FIRE-PLACES, COUNT RUMFORD'S IMPROVEMENTS OF. The ingenious Count Rumford has lately published a valuable Essay on the most beneficial form in which common fire-places may be constructed; so as not only to prevent smoking, but also to improve them in all other respects. See **SMOKING**.

FIRE-POTS, in the military art, small earthen pots, into which is put a charged grenade, and over that powder enough to cover the grenade; then the pot is covered with a piece of parchment, and two pieces of match across lighted: this piece being thrown by a handle of matches where it is designed, it breaks and fires the powder, and burns all that is near it, and likewise fires the powder in the grenade, which ought to have no fuse, that its operations may be the quicker.

FIRE-REEDS, reeds used in fire-ships. They are made up in small bundles of about a foot in circumference, cut even at both ends, and tied together in two places. They are distinguished into two kinds, viz. the long and short; the former of which are four feet, and the latter two feet five inches in length. One part of them are singly dipped, i. e. at one end; the rest are dipped at both ends in a kettle of melted composition. After being immersed about seven or eight inches in this preparation, and then drained, they are sprinkled over with pulverised sulphur upon a tanned hide.

FIRE-SHIP, in the navy, a vessel charged with artificial fire-works, which having the wind of an enemy's ship, grapples her, and sets her on fire.

FIRE-STONE. See **PYRITES**.

FIRE-WORKS, preparations made of gun-powder, sulphur, and other inflammable and combustible ingredients, used on occasion of public rejoicings and other solemnities. The invention of fire-works is by M. Mahudel attributed to the Florentines and people of Sienna; who found out likewise the method of adding decorations to them of statues, with fire issuing from their eyes and mouths. The art of preparing and managing these is called pyrotechny. See **PYROTECHNY**.

FIRING, in the military art, denotes the discharge of the fire-arms; and its object is to do the utmost execution to the enemy.

The present method of firing by platoons is said to have been invented by Gustavus Adolphus; and first used about 1618: the reason for this method is, that a constant fire may be always kept up. There are three different ways of platoon firing: viz. standing, advancing, and retreating. But previous to every kind of firing, each regiment or battalion must be told off in grand divisions, subdivisions, and platoons, exclusively of the grenadiers, which form two subdivisions or four platoons of themselves. In firing standing, either by divisions or platoons, the 1st fire is from the division or platoon on the right; the 2d fire from the left; the 3d from the right again; and so on alternately, till the firing comes to the centre platoon, which is generally called the colour platoon, and does not fire, remaining as a reserve for the colours. Firing advancing is performed in the same manner, with this addition, that before either division or platoon fires, it advances three paces forward. Firing retreating varies from either of the former methods; for before either division or platoon fires, if they are marching from the enemy, it must go to the right about, and after firing, to the left about again, and continue the retreat as slow and orderly as possible. In hedge-firing the men are drawn up two deep, and in that order both ranks are to fire standing. Oblique firing is either to the right and left, or from the right and left to the centre, according to the situation of the object. The Prussians have a particular contrivance for this purpose; if they are to level to the right, the rear ranks of every platoon make two quick but small paces to the left, and the body of each soldier turns one-eighth of a circle, and vice versa. Parapet firing depends on the nature of the parapet over which the men are to fire, and also upon that of the attack made to possess it. This method of firing is sometimes performed by single ranks stepping on the banquette and firing: each man instantly handing his arms to the centre rank of the same file, and taking his back in the room of it; and the centre rank giving it to the rear to load, and forwarding the arms of the rear to the front rank; by which means the front rank men can fire six or seven rounds in a minute with exactness. Parapet firing may also be executed two deep, when the banquette is three feet broad, or in field works, where no banquettes are made. Square firing is performed by a regiment or body of men drawn up in a hollow square, in which case each front is generally divided into four divisions or firings, and the flanks of the square being the weakest part, are covered by four platoons of grenadiers. The first fire is from the right division of each face; the 2d from the left division of each face, &c. and the grenadiers make the last fire. Street-firing is practised in two ways; either by making the division or platoon that has fired to wheel by half rank to the right and left outwards from the centre, and to march in that order by half divisions down the flanks on each side of the column, and to draw up in the rear, and go on with their priming and loading; or, to make the division or platoon, after firing, to face to the right and left outwards from the centre, and one half rank to follow the other; and in that order to march in one centre file down on each side of the column into the rear, and there draw up as before.

FIRING, in farriery. See **FARRIERY**.

FIRING IRON, an instrument used by farriers, resembling the blade of a knife, which being made red-hot is applied to a horse's skin, to discuss tumours, knots, &c. The practice is justly condemned by Osmer. See **FARRIERY**.

FIRKIN, an English measure of capacity for things liquid, being the fourth part of the barrel; it contains eight gallons of ale, soap, or herrings; and nine gallons of beer.

FIRLOT, a dry measure used in Scotland. The oat firlo contains 21½ pints of that country; the wheat firlo contains about 2,211 cubical inches; and the barley firlo, 31 standard pints. Hence it appears that the Scotch wheat firlo exceeds the English bushel by thirty-three cubical inches.

FIRMAMENT, in the ancient astronomy, the eighth heaven or sphere; being that wherein the fixed stars were supposed to be placed. It is called the eighth, with respect to the seven heavens or spheres of the planets which it surrounds. It was supposed to have two motions; a diurnal motion, given it by the primum mobile, from E. to W. about the poles of the ecliptic; and another opposite motion from W. to E.; which last it finishes, according to Tycho, in 25,412 years; according to Ptolemy, in 36,000; and according to Copernicus, in 258,000; in which time

the fixed stars return to the same precise points wherein they were at the beginning. This period is commonly called Plato's year, or the great year. In various places of Scripture firmament is used for the middle region of the air. Many of the ancients allowed, with the moderns, that the firmament is a fluid matter; though they, who gave it the denomination of firmament, must have taken it for a solid one.

FIRMAN, a passport or permit granted by the Great Mogul to foreign vessels, to trade within his territories.

FIRMNESS, in physiology, the consistence of a body, or that state wherein its sensible parts cohere in such a manner, that the motion of one part induces a motion in the rest.

FIRO, a species of *Acarus*. See *ACARUS*.

FIRST-BORN. See *PRIMOGENITURE*. This word is often used in Scripture in a figurative sense for that which is first, most excellent, most distinguished in any thing. Thus it is said of Christ (Col. i. 15,) that he is "the first-born of every creature;" and in the Revelation (i. 5,) he is called "the first-begotten of the dead;" that is, according to the commentators, Begotten of the Father before any creature was produced; and the first who rose from the dead by his own power. "The first-born of the poor," (Isa. xiv. 30,) signifies, The most miserable of all the poor; and in Job (xviii. 13,) "The first-born of death; that is, The most terrible of all deaths.

FIRST-FRUIITS, [*primitiæ*, Lat.] among the Hebrews, were oblations of part of the fruits of the harvest, offered to God as an acknowledgment of his sovereign dominion. The first of these fruits were offered in the name of the whole nation, being either two loaves of bread, or a sheaf of barley which was threshed in the court of the temple. Every private person was obliged to bring his first-fruits to the temple; and these consisted of wheat, barley, grapes, figs, apricots, olives, and dates. There was another sort of first-fruits which were paid to God. When bread was kneaded in a family, a portion of it was set apart, and given to the priest or Levite who dwelt in the place: if there was no priest or Levite there, it was cast into the oven, and consumed by the fire. These offerings made a considerable part of the revenues of the Hebrew priesthood.

FIRST-FRUIITS are frequently mentioned by ancient Christian writers as one part of the church revenue. One of the councils of Carthage enjoined, that they should consist only of grapes and corn; which shews, that this was the practice of the African church.

FIRST-FRUIITS, in the church of England, are the profits of every spiritual benefice for the first year, according to the valuation thereof in the king's books.

FIRUZABAD, a town of Persia, in the province of Faristan, 75 miles S. S. W. of the Schiras.

FISC, or **FISCUS**, [from *φισκος*, Gr. a great basket,] in the civil law, the treasury of a prince or state; or that to which all things due to the public fall. By the civil law, none but a sovereign prince has a right to have a fisc or public treasury.

FISCAL, in the civil law, something relating to the pecuniary interest of the prince or people.

FISCAL, a town of Spain in Arragon, 15 miles N. W. of Ainsa.

FISCHA, a river of Germany, in Austria, which runs into the Danube, at Fischamund.

FISCI ADVOCATI, and **FISCI PROCURATORES**, officers appointed for the management of the fisc.

FISH, in natural history, constitutes a class of animals which have no feet, but always fins; add to this, that their body is either altogether naked, or only covered with scales; and that they are aquatic animals, which live mostly, if not always, in water. See *FISCHES*.

FISH, in a ship, a plank or piece of timber, fastened to a ship's mast or yard, to strengthen it; which is done by nailing it on with iron spikes, and winding ropes hard about them.

FISHES, in heraldry, are the emblems of silence and watchfulness; and are born either upright, imbowd, extended, endorsed respecting each other, surmounting one another, fretted, &c. In blazoning fishes, those born feeding, should be termed devouring; all fishes born upright and having fins, should be blazoned hauriant; and those born transverse the escutcheon, must be termed naiant.

FISHES, BLOWING OF, is a practice similar to that of blowing flesh, poultry, and pigs, and adopted for the same deceitful pur-

poses. The method of blowing fish, especially cod and whittings, is by placing the end of a quill or tobacco-pipe at the vent, and pricking a hole with a pin under the fin which is next the gill; thereby making the fish appear to the eye large and full, which when dressed will be flabby, and little else than skin and bones. But this imposition may be discovered by placing the finger and thumb on each side of the vent, and squeezing it hard; the wind may be perceived to go out, the skin will fall in, and the fish seem lank, and of little value.

FISHES, FEEDING OF. When they are fed in large pools or ponds, either malt boiled, or fresh grains, is the best food; thus carps may be raised and fed like capons; and tenches will feed as well. The care of feeding them is best committed to a gardener or the butler, who should be always at hand. When fed in a stew, any sort of grain boiled, especially peas, and malt coarsely ground, are proper food; also the grains after brewing, while fresh and sweet; but one bushel of malt not brewed, will go as far as two of grains.

FISH, GOLD. See *CYPRINUS*.

FISH, PRESERVING OF, FOR CABINETS. Linnæus's method is, to expose them to the air; and when they acquire such a degree of putrefaction that the skin loses its cohesion to the body of the fish, it may be slid off almost like a glove: the two sides of this skin may then be dried upon paper like a plant, or one of the sides may be filled with plaster of Paris to give the subject a due plumpness. A fish may be prepared, after it has acquired this degree of putrefaction, by making a longitudinal incision on the belly, and carefully dissecting the fleshy part from the skin, which are but slightly attached to it in consequence of the putrescency. The skin is then to be filled with bottom and the antiseptic powder as directed for birds; and, lastly, to be sewed up where the incision was made. See *BIRD*.

FISH, THE RIGHT AND PROPERTY OF. It has been held, that where the lord of the manor has the soil on both sides of the river, it is good evidence that he has the right of fishing; but where the river ebbs and flows, and is an arm of the sea, there it is common to all, and he who claims a privilege to himself must prove it. In the Severn, the soil belongs to the owners of the land, on each side; and the soil of the river Thames is in the king, &c. but the fishing is common to all. 1 Mod. 105. Any person who shall unlawfully break, cut, or destroy, any head or dam of a fish-pond, or wrongfully fish therein, with intent to take or kill fish, shall on conviction at the suit of the king, or of the party, at the assizes or sessions, be imprisoned three months, and pay treble damages, and after the expiration of the three months, shall find sureties for his good behaviour for seven years, or remain in prison till he does. 5 Eliz. c. 21. If any person shall enter into any park or paddock, fenced in and enclosed, or into any garden, orchard, or yard, adjoining or belonging to any dwelling-house, in or through which park or paddock, garden, orchard, or yard, any stream of water shall run, or wherein shall be any river, stream, pond, pool, moat, stew, or other water, and by any means or device whatsoever, shall steal, take, kill, or destroy, any fish bred or kept in it, without the consent of the owner, or shall be aiding therein, or shall receive or buy any such fish, knowing them to be so stolen or taken as aforesaid, and shall be convicted thereof at the assizes, within six calendar months after the offence shall be committed, he shall be transported for seven years. And any offender, surrendering himself to a justice, or being apprehended or in custody for such offence, or on any other account, who shall make confession thereof, and a true discovery on oath of his accomplice or accomplices, so that such accomplice may be apprehended, and shall on trial give evidence, so as to convict such accomplices, shall be discharged of the offence, so by him confessed. And if any person shall take, kill, or destroy, or attempt to take, kill, or destroy, any fish in any river, or stream, pond, pool, or other water, (not in any park or paddock, or in any garden, orchard, or yard, adjoining or belonging to any dwelling-house, but in any other enclosed ground, being private property) he shall, on conviction before one justice, on the oath of one witness, forfeit 5l. to the owner of the fishery of such river, pond, or other water; and such justice, on complaint upon oath, may issue his warrant to bring the person complained of before him; and if he shall be convicted before such justice, or any other of the county or place, he shall immediately

immediately pay the said penalty of 5l. to such justice, for the use of the person, as the same is appointed to be paid unto; and in default thereof, shall be committed by such justice to the house of correction, for any time not exceeding six months, unless the forfeiture shall be sooner paid: or such owner of the fishery may, within six calendar months after the offence, bring an action for the penalty in any of the courts of record at Westminster. 5 G. III. c. 14.

FISH-PONDS, those made for the breeding or feeding of fish. Fish-ponds are no small improvement of watery and boggy lands, many of which are fit for no other use. In the making of a pond, its head should be at the lowest part of the ground, that the trench of the flood-gate or sluice, having a good fall, may not be too long in emptying. The best way of making the head secure, is to drive in two or three rows of stakes above six feet long, at about four feet distance from each other, the whole length of the pond-head, of which the first row should be rammed at least about four feet deep. If the bottom be false, the foundation may be laid with quicklime, which slacking, will make it as hard as a stone. Some lay a layer of lime, and another of earth dug out of the pond, among the piles and stakes; and when these are well covered, drive in others, as they see occasion, ramming in the earth as before, till the pond-head is of the height designed. The dam should be made sloping on each side, leaving a waste to carry off the over-abundance of water in times of floods or rains; and as to the depth of the pond, the deepest part need not exceed six feet, rising gradually in shoals towards the sides, for the fish to sun themselves, and lay their spawn. Gravelly and sandy bottoms, especially the latter, are best for breeding; and a fat soil, with a white fat water, as the washings of hills, commons, streets, sinks, &c. is best for fattening all sorts of fish. For storing a pond, carp is to be preferred for its quick growth, and great increase, as breeding five or six times a-year; but tench for its goodness. The quantity of fish to be supplied obviously depends upon the quantity of water, which should be divided, where it conveniently can, into five ponds. Number five is intended for breeding, and should be double or treble the size of any of the other ponds. Or if this be inconvenient, there may be two for this purpose. This pond may likewise be the most distant from the house. If the breeding-pond should fail to answer this purpose, it will at least serve as a conservatory for fish of small size, to be obtained elsewhere: and indeed, fresh stores in any case will be found desirable. The contents of this pond in carp and tench, or the greatest part, should be taken out annually in September or October, counted in braces, and such as are from five to seven inches long thrown into the pond called No. 4. The contents of No. 4, when grown one year from the length of five or seven inches, must be put into No. 3. The contents of No. 3, having grown one year from No. 4, must be removed into No. 2. And in like manner, the contents of No. 2, after one year, must be removed into No. 1, which is to contain only such fish as are fit for the table. It is obvious that this pond for safety and convenience, should be the nearest to the house. As No. 5 is to be the largest water, so No. 1 is to be the least; the rest of sizes between the two. The shape of No. 1 should be oblong, for the convenience of the net, and the less disturbance of the fish in taking out what are wanted from time to time. A book should be kept of the number and size of each kind in every pond. Carp are fit for the table from three to seven pounds each. Tench from one pound and a half to three pounds each. Perch from three quarters of a pound to one or two pounds, &c. It is supposed that none of the ponds have a strong current of very cold, acrid, innutritious water. One acre of water upon a loam, clay, or marl, or any of these with a mixture of gravel, has been stated to be capable of supporting 2000 pounds weight of fish; the number of fish making that weight being immaterial. Carp and tench breed most freely in ponds, or pits newly made. Tench likewise in almost any ponds, where cattle are admitted. It is evident that perch and pike should not be admitted in any degree in No. 5; but in all the other numbers, besides their own value, they are of important service, provided that they are strictly confined to a size greatly subordinate to that of the carp, or tench. For they destroy not only the accidental spawn of fish which breed, but also several animals, whose food is the same with that of carp and tench, as frogs, newts, &c. Pike above the weight of one or two pounds must

not be admitted even amongst carp of the largest size and weight. With regard to the absolute weight of fish, which any particular pond will support, this can only be determined by observation and experience; as it depends on the different degrees of nutrition in different waters. It is said, that carp and tench in waters which feed well, will before they are aged, double their weight in one year. The third part of an acre in No. 1 would probably be sufficient for the demand of any family. For, upon the calculation above given, it would support near 700 pounds of fish, which might be divided thus. Fifty brace of carp of three pounds each and upwards. Fifty brace of tench of two pounds each and upwards. Fifty brace of perch of one pound each and upwards. That is, three brace of fish, weighing at least twelve pounds, for the use of every week. Allowing one acre for No. 5, one-third of an acre for No. 1, and one acre and two-thirds for the intervening numbers, the whole water would be three acres. Upon this calculation the stock of No. 1 at 8d. per pound, would be worth 23l. 6s. 8d. per annum, and the expence annually of changing the fish from No. 5 to 4, &c. will not exceed 1l. 6s. 8d. So that the value of each acre would be at lowest 7l. 6s. 8d. annually. No. 1 being supposed to be near the house, and at no great distance from the garden, if the fish should not thrive sufficiently, which will be seen by the disproportioned size of the head, and the whiteness or paleness of the scales, they may easily be supplied with more food by loose peas from the garden, the sweeping of the granary, worms saved by the gardener in digging, and the offal of the poultry killed for the kitchen; or by letting down the water about two feet, in the spring or summer, where there is a sufficient supply, and sowing the sides with oats, barley, rye, or wheat, very lightly raked in, and then stopping the sluice again. In ponds already stocked, but not accurately regulated, it would be advisable to begin with that which has the most pike, otherwise with No. 4, or what is intended for No. 4, and throw all the fish under five inches length into No. 5, and the larger, according to their sizes, into the other numbers: and so on with Nos. 3, 2, 1. Store-fish procured elsewhere, if taken in summer, should be moved in the night in clean straw, wetted occasionally after they are packed: except perch and pike, which can only be carried in clean pond or river water. In moving fish from one pond to another, they should be first put into tubs of water already prepared for them, and afterwards carried in buckets without water. In taking pike or perch, great care must be observed to avoid raising mud in the water. In breeding-ponds, all water-fowls, as geese, ducks, &c. should be discouraged; and herons carefully destroyed. If any white fish, as roach, dace, &c. should be found, they are to be taken out; and if there is a spare piece of water for large pike they should be put into it as food for the pike. Eels may be put with advantage into any except the breeding-ponds, in lieu of perch. The most easy way of taking them is by trimmers laid overnight, baited with small fish, not with worms; otherwise they may catch the carp; or a small thief-net may be baited with white fish. Common sewers and drains from the laundry are prejudicial to fish: so are the leaves falling from trees in great quantities. The use of grains should likewise be avoided in large quantities, as having little nutriment whilst they are thus washed with water. It seems better for the use of the table, as well as more humane, to kill fish designed for food by an incision with a sharp-pointed pen-knife, or punctures made with a pin longitudinally into the brain, about half an inch or an inch, according to the size of the fish, above the eyes. As this produces an instantaneous effect, it would probably save the cruel operation of crimping or flaying fish while alive, as in the case of pike and eels. It is obvious, that this method of regulating fish will apply with its full effect in larger spaces of water: it will likewise apply in a considerable degree to smaller pieces, even where the change is but from a pond for the use of cattle to a single canal in a garden. In situations near the great inland manufactures, and near the turnpike roads leading from an easy distance to the metropolis, water may be made by this kind of management, with little trouble or expence, to produce a large annual rent.

FISHER, JOHN, an English prelate, was born at Beverly, in Yorkshire, in 1459, and educated at Cambridge. He became confessor to Margaret, countess of Richmond, mother to Henry VII. who by his advice founded St. John's and Christ's colleges, Cambridge. He was afterwards chosen chancellor of that university.

university, and was a liberal encourager of learning. In 1504 he was made bishop of Rochester, from which he would never remove to a better see. He was a zealous opponent of the Reformation, and of the king's divorce from Queen Catherine. Great efforts were made to bring him to acknowledge the king's supremacy, which proving ineffectual, he was sent to the Tower. While in confinement the pope made him a cardinal, which so enraged the king, that he caused him to be tried for high treason, condemned, and beheaded in 1535. He was a man of considerable learning, strict integrity, and fervent piety. He wrote a commentary on the Penitential Psalms: a Defence of the King's Book against Luther; a Funeral Sermon for the Lady Margaret, &c.

FISHERMEN. There shall be a master, wardens, and assistants of the fishmongers' company in London chosen yearly, at the next court of the lord mayor and aldermen after the 10th of June, who are constituted a court of assistants; and they shall meet once a month at their common hall to regulate abuses in fishery, register the names of fishermen, and mark their botes, &c.

FISHERY, a place where great numbers of fish are caught. The principal fisheries for salmon, herring, mackarel, pilchards, &c. are along the coasts of England, Scotland, and Ireland; for cod, on the banks of Newfoundland; for whales, about Greenland; and for pearls, in the East and West Indies.

FISHERY, FREE, in law, or an exclusive right of fishing in a public river, is a royal franchise; and is considered as such in all countries where the feudal polity has prevailed: though the making of such grants, and by that means appropriating, what it seems unnatural to restrain, the use of running water, was prohibited for the future by Magna Charta; and the rivers that were fenced in King John's time were directed to be laid open, as well as the forests to be disforested. This opening was extended by the second and third charters of Henry III. to those also that were fenced under Richard I.; so that a franchise of free fishery ought now to be as old at least as the reign of Henry II. This differs, as judge Blackstone observes, from a several of piscary, because he that has a several fishery must also be the owner of the soil, which in a free fishery is not requisite. It differs also from a common fishery, in that the free fishery is an exclusive right, the common is not so; and therefore, in a free fishery, a man has a property in the fish before they are caught; in a common piscary, not till afterwards. Some indeed have considered a free fishery not as a royal franchise, but merely as a private grant of a liberty to fish in the several fishery of the grantor. But the considering of such right as originally a flower of prerogative, till restrained by Magna Charta, and derived by royal grant (previous to the reign of Richard I.) to such as now claim it by prescription, may remove some difficulties in respect to this matter with which our law-books are embarrassed.

FISHERY, denotes also the commerce of fish, more particularly the catching of them for sale. Were we to enter into a very minute consideration of the fisheries established in this kingdom, this article would swell beyond its proper bounds; since fisheries, however, if successful, are not only objects of great commercial importance, but also contribute materially to our naval strength, by becoming permanent nurseries for seamen, we shall take notice of some of the most considerable of the British fisheries, and the institutions set on foot for their support. The situation of the British coasts is the most advantageous in the world for catching fish: the Scottish islands, particularly those to the north and west, lie most commodious for carrying on the fishing trade to perfection. Of these advantages the Scots seem indeed to have been abundantly sensible; for their traffic in herrings is even noticed in history so early as the ninth century. The frequent laws which were enacted in the reigns of James III. IV. and V. discover a steady determined zeal for the benefit of the country, and the full restoration of these fisheries which the Dutch had found means to engross. The Scottish fisheries were, however, more particularly indebted to the zealous encouragement of James V. and VI.; the former having planned, and the latter carried into execution, various projects for their extension. The well-meant effort of James VI. were impeded, and at last wholly suspended, by the disputes which prevailed in the kingdom at that period concerning the succession. Nevertheless the plan was resumed by Charles I. who "ordained an association of the three kingdoms, for a general fish-

ing within the seas and coasts of his majesty's said kingdoms; and for the government of the said association, ordained, that there should be a standing committee chosen and nominated by his majesty and his successors from time to time," &c. Several persons of distinction embarked in the design, which the king honoured with his patronage, and encouraged by his bounty. He also ordered Lent to be more strictly observed; prohibited the importation of fish taken by foreigners; and agreed to purchase from the company his naval stores, and the fish for his fleets. Thus the scheme for establishing a fishery in the Hebrides began to assume a favourable aspect; but all the hopes of the adventurers were frustrated by the breaking out of the civil wars, and the very tragical death of their benefactor. In 1661, Charles II. the duke of York, lord Clarendon, and other persons of rank and fortune, resumed the business of the fisheries with greater vigour than any of their predecessors. For this purpose the most salutary laws were enacted by the parliaments of England and Scotland; in virtue of which, all materials used in, or depending upon, the fisheries, were exempted from all duties, excises, or imposts whatever. In England, the company were authorised to set up a lottery and to have a voluntary collection in all parish churches. Houses of entertainment, as taverns, inns, ale-houses, were to take one or more barrels of herrings, at the stated price of 30s. per barrel: also 2s. 6d. per barrel Dutch was to be paid to the company on all imported fish taken by foreigners. Some families were also invited, or permitted, to settle at Sornaway: the herrings cured by the royal English company gave general satisfaction, and, as mentioned above, brought a high price for those days. Every circumstance attending this new establishment seemed the result of a judicious plan and thorough knowledge of the business, when the necessities of the king obliged him to withdraw his subscription of bounty; which gave such umbrage to the parties concerned, that they soon after dissolved. In 1677, a new royal company was established in England, at the head of which were the duke of York, the earl of Derby, &c. Besides all the privileges which former companies had enjoyed, the king granted this new company a perpetuity, with power to purchase lands; and also 20*l.* to be paid them annually out of the customs of the port of London, for every dogger or buss they should build and send out for seven years to come. A stock of 10,980*l.* was immediately advanced, and afterward 1600*l.* more. This small capital was soon exhausted in purchasing and fitting out busses, with other incidental expences. The company made, however, a successful beginning; and one of their busses or doggers actually took and brought home 32,000 cod-fish; other vessels had also a favourable fishery. Such flattering beginnings might have excited fresh subscriptions, when an unforeseen event ruined the whole beyond the possibility of recovery. Most of the busses had been built in Holland, and manned with Dutchmen; on which pretence the French, who were then at war with Holland, seized six out of seven vessels, with their cargoes and fishing-tackle: and the company being now in debt, sold in 1680 the remaining stores, &c. A number of gentlemen and merchants raised a new subscription of 60,000*l.* under the privileges and immunities of the former charter. This attempt also came to nothing, owing to the death of the king, and the troubles of the subsequent reign. Soon after the revolution this business was again resumed upon a more extensive scale; the proposed capital being 300,000*l.* of which 100,000*l.* was to have been raised by the surviving patentees or their successors, and 20,000*l.* by new subscribers. Copies of the letters patent, the constitution of the company, and terms of subscription, were lodged at sundry places in London and Westminster for the perusal of the public, while the subscription was filling. It is probable that king William's partiality to the Dutch fisheries, the succeeding war, or both of these circumstances, frustrated this new attempt; of which we have no further account in the annals of that reign or since. The Scottish parliament had also during the last three reigns, passed various acts for erecting companies and promoting the fisheries; but the intestine commotions of that country, and the great exertions which were made for the Darien establishment, enfeebled all other attempts, whether collectively or by individuals, within that kingdom. In 1749, his late majesty, having, at the opening of the parliament, warmly recommended the improvement of the fisheries, the house of commons appointed a committee to inquire into the state of herring and white fisheries, and to consider of the most probable means of

extending the same. All ranks of men were elevated with an idea of the boundless riches that would flow into the kingdom from this source. A subscription of 500,000*l.* was immediately filled in the city, by a body of men who were incorporated for twenty-one years by the name of The Society of the Free British Fishery. Every encouragement was held out by government, both to the society and to individuals, who might embark in this national business. A bounty of 36*s.* per ton was to be paid annually out of the customs for fourteen years, to the owners of all decked vessels or busses, from twenty to eighty tons burden, which should be built after the commencement of the act, for the use of, and fitted out and employed in, the said fisheries, whether by the society or any other persons. At the same time numerous pamphlets and newspaper-essays came forth; all pretending to elucidate the subject, and to convince the public with what facility the herring-fisheries might be transferred from Dutch to British hands. This proved however, a more arduous task than had been foreseen by superficial speculators. The Dutch were frugal in their expenditures and living; perfect masters of the arts of fishing and curing, which they had carried to the greatest height and perfection. They were in full possession of the European markets; and their fish, whether deserving or otherwise, had the reputation of superior qualities to all others taken in our seas. With such advantages the Dutch not only maintained their ground against this formidable company, but had also the pleasure of seeing the capital gradually sinking, without having procured an adequate return to the adventurers; notwithstanding various aids and efforts of government from time to time in their favour, particularly in 1757, when an advance of 20*s.* per ton was added to the bounty. In 1786 the public attention was again called to the state of the British fisheries, by the suggestions of Mr. Dempster in the house of commons, and by different publications that appeared upon the subject: in consequence of which, the minister suffered a committee to be named, to inquire into this great source of national wealth. To that committee it appeared that the best way of improving the fisheries was, to encourage the inhabitants living nearest to the seat of them to become fishers. And it being found that the north-western coast of the kingdom, though abounding with fish and fine harbours, was utterly destitute of towns, an act was passed for incorporating certain persons therein named, by the style of "The British Society for extending the fisheries, and improving the sea-coasts of this kingdom;" and to enable them to subscribe a joint stock, and therewith to purchase lands, and build thereon free towns, villages, and fishing-stations, in the Highlands, and islands in that part of Great Britain called Scotland, and for other purposes. The Isle of Mull, Loch-Broom, the Isles of Sky and of Canay, have already been marked as proper situations for some of these towns. The progress of such an undertaking from its nature must be slow, but still slower when carried on with a limited capital arising from the subscriptions of a few public-spirited individuals. But it is not to be doubted that it will ultimately tend to the increase of our fisheries, and to the improvement of the Highland part of this kingdom. Its tendency is also to lessen the emigration of a brave and industrious race of inhabitants, too many of whom have already removed with their families to America.

ANCHOVY-FISHERY. The anchovy is caught in the months of May, June, and July, on the coasts of Catalonia, Provence, &c. at which season it constantly repairs up the straits of Gibraltar into the Mediterranean. Collins says they are also found in plenty on the western coasts of England and Wales. The fishing for them is chiefly in the night-time; when a light being put on the stern of their little fishing-vessels, the anchovies flock round, and are caught in the nets. But then it is asserted to have been found by experience, that anchovies taken thus by fire, are neither so good, so firm, nor so proper for keeping, as those that are taken without fire. When the fishery is over, they cut off the heads, take out their gall and guts, and then lay them in barrels, and salt them. The common way of eating anchovies is with oil, vinegar, &c. in order to which they are first boned, and the tails, fins, &c. slipped off. Being put on the fire, they dissolve almost in any liquor. Or they are made into sauce by mincing them with pepper, &c. Some also pickle anchovies in small delft or earthen pots, made on purpose, of two or three pounds weight, more or less, which they cover with plaister to keep them the better. Anchovies should be chosen small, fresh pickled, white on the out-

side and red within. If genuine, they have round backs; for those which are flat or large are often nothing but sardines. Besides these qualities, the pickle, on opening the pots or barrels, should be of a good taste, and not have lost its flavour.

COD-FISHERY. There are two kinds of cod-fish; the one green or white cod; the other dried or cured cod; though it is all the same fish differently prepared; the former being sometimes salted and barrelled, then taken out for use; and the latter having lain for a competent time in salt, and then dried in the sun or smoke. The chief fisheries for green cod are in the bay of Canada, on the great bank of Newfoundland, and on the isle of St. Peter, and the isle of Sable; to which places vessels resort from many parts both of Europe and America. They are from 100 to 150 tons burthen, and will catch between 30,000 and 40,000 cod each. The most essential part of the fishery is, to have a master to know how to cut up the cod, one who is skilled to take off the head properly, and above all a good salter, on which the preserving of them, and consequently the success of the voyage, depend. The best season is from the beginning of February to the end of April; the fish, which in the winter retire to the deepest water, coming then on the banks, and fattening extremely. What are caught from March to June keep well; but those taken in July, August, and September, when it is warm on the banks, are apt to spoil soon. Each fisher takes but one at a time, yet the most expert will take from 350 to 400 in a day; but that is the most, the weight of the fish and the great coldness on the bank fatiguing very much. As soon as the cod are caught, the heads are taken off; they are opened, gutted, and salted; and the salter stows them in the bottom of the hold, head to tail, in beds a fathom or two square; putting layers of salt and fish alternately, but never mixing fish caught on different days. When they have lain thus three or four days to drain off the water, they are placed in another part of the ship, and salted again, where they remain till the vessel is loaded. Sometimes they are cut in thick pieces, and put in barrels for the greater convenience of carriage. The principal fishery for dry cod is, from Cape Rose to the Bay des Exports, along the coast of Placentia, in which compass there are several commodious ports for the fish to be dried in. These, though of the same kind with the fresh cod, are much smaller, and therefore fitter to keep, as the salt penetrates more easily into them. The fishery of both is much alike; only this latter is most expensive, as it takes up more time and employs more hands, and yet scarcely half so much salt is spent in this as in the other. The bait is herring, of which great quantities are taken on the coast of Placentia. When several vessels meet and intend to fish in the same port, he whose shallow first touches ground, becomes entitled to the quality and privileges of admiral: he has the choice of his station, and the refusal of all the wood on the coast at his arrival. As fast as the masters arrive, they unrig all their vessels, leaving nothing but the shrouds to sustain the masts; and in the mean time the mates provide a tent on shore covered with branches of trees, with sails over them, with a scaffold of great trunks of pines, twelve, fifteen, sixteen, and often twenty feet high, commonly from forty to sixty feet long, and about one-third as much in breadth. While the scaffold is preparing, the crew are fishing; and as fast as they catch, they bring their fish ashore, and open and salt them upon moveable benches; but the main salting is performed on the scaffold. When the fish have taken salt, they wash and hang them to drain on rails; when drained, they are laid on a sort of stages, which are small pieces of wood laid across, and covered with branches of trees, having the leaves stripped off for the passage of the air. On these stages they are disposed a fish thick, head against tail, with the back uppermost, and are turned carefully every twenty-four hours. When they begin to dry, they are laid in heaps ten or twelve thick, in order to retain their warmth; and every day the heaps are enlarged, till they become double their first bulk; then two heaps are joined together, which they turn every day as before; lastly, they are salted again, beginning with those first salted; and being laid in huge piles, they remain in that situation till they are carried on board the ships, where they are laid on the branches of trees disposed for that purpose, upon the ballast, and round the ship, with mats to prevent their contracting any moisture. The cod supplies four kinds of commodities, viz. the sounds, the tongues, the roes, and the oil which is extracted from its liver. The first are salted at the fishery, together with the fish, and put

in barrels of from 600 to 700 pounds. The tongues are cured in like manner, and brought in barrels of from 400 to 500 pounds. The roes are also salted in barrels, and serve to cast into the sea to draw fish together, and particularly pilchards. The oil comes in barrels of from 400 to 520 pounds, and is used in dressing leather. In Scotland they catch a small kind of cod on the coast of Buchan, and all along the Murray Frith on both sides; as also in the Frith of Forth, Clyde, &c. which is much esteemed. They salt and dry them in the sun upon rocks, and sometimes in the chimney.

HERRING-FISHERY. Our great stations for this fishery are off the Shetland and Western isles, and off the coast of Norfolk, in which the Dutch also share. See the article *CLUPEA*. There are two seasons for herring fishing: the first from June to the end of August; the second in autumn, when the fogs become very favourable for this kind of fishing. The Dutch begin their herring-fishing on the 24th of June, and employ a vast number of vessels called busses, between fifty-four and sixty tons burthen each, and carrying three or four small guns. They never stir out of port without a convoy, unless there are enough to make about eighteen or twenty cannon among them, in which case they are allowed to go in company. Before they go out they make a verbal agreement, which has the same force as if it was in writing. The regulations of the admiralty of Holland have been partly followed by the French and other nations, and partly improved and augmented with new ones; as, that no fisher shall cast his net within 100 fathoms of another boat: that while the nets are cast, a light shall be kept on the hind part of the vessel: that when a boat is by any accident obliged to leave off fishing the light shall be cast into the sea: that when the greater part of a fleet leaves off fishing, and casts anchor, the rest shall do the same, &c. In the late king's reign very vigorous efforts were made, and bounties allowed, for the encouragement of the British herring fisheries: the first was of 30s. per ton to every buss of 70 tons and upwards. This bounty was afterwards raised to 50s. per ton, to be paid to such adventurers as were entitled to it by claiming it at the place of rendezvous. The busses are from twenty to ninety tons burthen, but the best size is eighty. A vessel of eighty tons ought to take ten lasts, or 120 barrels of herrings, to clear expences, the price of the fish to be admitted to be a guinea a barrel. A ship of this size ought to have eighteen men, and three boats; one of twenty tons should have six men, and every five tons above require an additional hand. To every ton are 250 yards of net; so a vessel of eighty tons carries 20,000 square yards; each net is twelve yards long, and ten deep; and every boat takes out from twenty to thirty nets, and puts them together so as to form a long train; they are sunk at each end of the train by a stone, which weighs it down to the full extent: the top is supported by buoys made of sheep skin, with a hollow stick at the mouth, fastened tight; through this the skin is blown up, and then stopped with a peg, to prevent the escape of the air. Sometimes these buoys are placed at the top of the nets; at other times the nets are suffered to sink deeper, by lengthening the cords fastened to them, every cord being for that purpose ten or twelve fathoms long. But the best fisheries are generally in more shallow water. Of the Scots fishery in the western isles, the following account is given by Mr. Pennant: "The fishing is always performed in the night, unless by accident. The busses remain at anchor, and send out their boats a little before sun-set; which continue out, in winter and summer, till day-light; often taking up and emptying their nets, which they do ten or twelve times in the night, in case of good success. During winter it is a most dangerous and fatiguing employ, by reason of the greatness and frequency of the gales in these seas; and in such gales are the most successful captures; but by the providence of Heaven, the fishers are seldom lost, and what is wonderful, few are visited with illness. They go out well prepared with a warm great coat, boots, and skin aprons, and a good provision of beef and spirits. The same good fortune attends the busses, which in the tempestuous season, and in the darkest nights, are continually shifting in these narrow seas from harbour to harbour. Sometimes eighty barrels of herrings are taken in a night by the boats of a single vessel. It once happened, in Loch-Slappon, in Skie, that a buss of eighty tons might have taken 200 barrels in one night, with 10,000 square yards of net; but the master was obliged to desist, for want of a sufficient number of hands to preserve the capture. The herrings are preserved by salting after

the entrails are taken out. The last is an operation performed by the country people, who get three-halfpence per barrel for their trouble, and sometimes, even in winter, can gain fifteen-pence a-day. This employs both women and children; but the salting is only entrusted to the crew of the busses. The fish are laid on their backs in the barrels, and layers of salt between them. The entrails are not lost, for they are boiled into an oil; 8000 fish will yield ten gallons, valued at one shilling the gallon. A vessel of eighty tons takes out 244 barrels of salt; a drawback is allowed for each barrel used by foreign or Irish exportation of the fish; but there is a duty per barrel for the home consumption, and the same for those sent to Ireland. The barrels are made of oak staves, chiefly from Virginia; the hoops from several parts of our own island, and are either of oak, birch, betel, or willow; the last from Holland, liable to a duty. The barrels cost about 6s. each; they hold from 500 to 800 fish, according to the size of the fish; and are made to contain thirty-two gallons. The barrels are inspected by proper officers: a cooper examines if they are statutable and good; if faulty he destroys them, and obliges the maker to stand to the loss." Herrings are cured either white (*i. e.* pickled), or red. Of the first, those done by the Dutch are most esteemed, being distinguished into four sorts, according to their sizes, and the best are those that are fat, fleshy, firm, and white, salted the same day they are taken with good salt and well barrelled. The British-cured herrings are little inferior, if not equal, to the Dutch; for in spite of all their endeavours to conceal the secret, their method of curing, lasting, or casking the herrings, has been discovered, and is as follows. After they have hauled in their nets, which they drag in the stern of their vessel backwards and forwards in traversing the coast, they throw them upon the ship's deck, which is cleared of every thing for that purpose: the crew is separated into divisions, and each division has a peculiar task; one part opens and guts the herrings, leaving the melts and roes; another cures and salts them, by lining or rubbing their inside with salt; the next packs them, and between each row and division they sprinkle handfuls of salt; lastly, the cooper puts the finishing hand to all, by heading the casks very tight and stowing them in the hold. Red herrings must lie 24 hours in the brine, inasmuch as they are to take all their salt there; and when they are taken out, they are spitted, that is, strung by the head on little wooden spits, and then hung in a chimney made for that purpose. After which, a fire of brush wood, which yields much smoke but no flame, being made under them, they remain there till sufficiently smoked and dried, and are afterwards barrelled up for keeping.

LOBSTER FISHERY. Lobsters are taken along the British channel, and on the coast of Norway, whence they are brought to London for sale; and also in the frith of Edinburgh, and on the coast of Northumberland. See the article *CANCER*. By 10 and 11 W. III. c. 24, no lobster is to be taken under eight inches in length, from the peak of the nose to the end of the middle fin of the tail; and by 9 G. II. cap. 33, no lobsters are to be taken on the coast of Scotland from the first of June to the first of September.

MACKREL FISHERY. The mackrel is a summer fish of passage, found in large shoals, in different parts of the ocean, not far north; but especially on the French and English coasts. The fishing is usually in the months of April, May, and June, and even July, according to the place. See *SCOMBER*. They enter the English channel in April, and proceed up to the straits of Dover as the summer advances; so that by June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c. where the fish is most considerable. They are an excellent food fresh; and not to be despised when well prepared, pickled, and put up in barrels; a method of preserving them chiefly used in Cornwall. The fish is taken in two ways; either with a line or nets: the latter is the more considerable, and is usually performed in the night-time. The rules observed in the fishing for mackrel are much the same with those already mentioned in the fishery of herrings. There are two ways of pickling them: the first is by opening and gutting them, and filling the belly with salt, crammed in as hard as possible with a stick; which done they range them in strata or rows, at the bottom of the vessel, strewing salt between the layers. In the second way they put them immediately into tubs full of brine, made of fresh water and salt, and leave them to steep, till they have imbibed salt enough to make them keep; after which they

are taken out, and barrelled up, taking care to press them close down. Mackerel are not cured or exported as merchandize, except a few by the Yarmouth and Leostoff merchants, but are generally consumed at home; especially in the city of London and the sea-ports between the Thames and Yarmouth east, and the Land's-end in Cornwall west.

OYSTER-FISHERY. This fishery is principally carried on at Colchester, in Essex; Feversham and Milton, in Kent; the Isle of Wight; the Swales of the Medway; and Tenby on the coast of Wales. From Feversham, and the adjacent parts, the Dutch have sometimes loaded a hundred large hoys with oysters in a year. They are also taken in large quantities near Portsmouth, and in all the creeks and rivers between Southampton and Chichester: many of which are carried about by sea to London and to Colchester, to be fed in the pits about Wavenhoe and other places. See *OSTREA*.

PILCHARD-FISHERY. The chief pilchard-fisheries are along the coasts of Dalmatia, on the coast of Bretagne, and along the coasts of Cornwall and Devonshire. That of Dalmatia is very plentiful; that on the coast of Bretagne employs annually about 300 ships. Of the pilchard-fishery on the coast of Cornwall, the following account is given by Dr. Borlase: "It employs a great number of men on the sea, training them to naval affairs; employs men, women, and children, at land, in salting, pressing, washing, and cleaning; in making boats, nets, ropes, casks, and all the trades depending on their construction and sale. The poor are fed with the offals of the captures, the land with the refuse of the fish and salt; the merchant finds the gains of commission and honest commerce, the fishermen the gains of the fish. Ships are often freighted hither with salt, and into foreign countries with the fish, carrying off at the same time part of our tin. Of the usual produce of the great number of hogsheds exported each year for ten years from 1747 to 1756 inclusive, from the four ports of Fowey, Falmouth, Penzance, and St. Ives, it appears that Fowey has exported yearly 1732 hogsheds; Falmouth, 14,631 hogsheds and two-thirds; Penzance and Mount's Bay, 12,149 hogsheds and one-third; St. Ives, 1282 hogsheds; in all amounting to 29,795 hogsheds." Every hogshed for ten years last past, together with the bounty allowed for each hogshed exported, and the oil made out of each hogshed has amounted, one year with another on an average; to the price of 1*l.* 13*s.* 3*d.* so that the cash paid for pilchards exported has, at a medium, annually amounted to 49,532*l.* 10*s.*" The numbers that are taken at one shooting out of the nets are amazingly great. Mr. Pennant says, that Dr. Borlase assured him, that on the 5th of October, 1767, there were at one time inclosed in St. Ives' bay 7000 hogsheds, each hogshed containing 35,000 fish, in all 245 millions. The pilchards naturally follow the light, which contributes much to the facility of the fishery: the season is from June to September. On the coasts of France they make use of the roes of the cod-fish as a bait, which, thrown into the sea, makes them rise from the bottom, and run into the nets. On our coasts there are persons posted ashore, who, spying by the colour of the water where the shoals are, make signs to the boats to go among them to cast their nets. When taken, they are brought on shore to a warehouse, where they are laid up in broad piles, supported with backs and sides; and as they are piled they salt them with bay-salt; in which lying to soak for thirty or forty days, they run out much blood, with dirty pickle and bitter; then they wash them clean in sea-water; and when dry, barrel and press them hard down to squeeze out the oil, which issues out at a hole in the bottom of the cask.

SALMON-FISHERY. The chief salmon-fisheries in Europe are in England, Scotland, and Ireland, in the rivers and sea-coasts adjoining to the river-mouths. The most distinguished for salmon in Scotland are the river Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewly, &c. in most of which it is very common, about the height of summer, especially if the weather happens to be very hot, to catch four or five score of salmon at a draught. The chief rivers in England for salmon are, the Tyne, the Trent, the Severn, and the Thames. The fishing is performed with nets, and sometimes with a kind of locks or weirs made on purpose, which in certain places have iron or wooden grates so disposed, in an angle, that being impelled by any force in a contrary direction to the course of the river, they may give way and open a little at the point of contact, and immediately shut again, closing the angle. The salmon, therefore, coming up into the rivers, are admitted

into these grates, which open, and suffer them to pass through, but shut again and prevent their return. The salmon is also caught with a spear, which they dart into him when they see him swimming near the surface of the water. It is customary likewise to catch them with a candle and lantern, or wisp of straw set on fire: for the fish naturally following the light, are struck with the spear, or taken in a net spread for that purpose, and lifted with a sudden jerk from the bottom. The capture of salmon in the Tweed, about the month of July, is prodigious. In a good fishery, often a boat-load, and sometimes near two, are taken in a tide: some few years ago there were above 700 fish taken at one haul, but from 50 to 100 is very frequent. The coopers in Berwick then begin to salt the salmon thoroughly in pipes and other large vessels, and afterwards barrel them to send abroad; having then far more than the London markets can take off their hands. Most of the salmon taken before April, or the setting in of the warm weather, used to be sent fresh to London in baskets but are now conveyed in large square boxes with ice. It is also sent up boiled, pickled, and kitted. At the beginning of the season, when a ship is on the point of sailing, a fresh clean salmon will sell from a shilling to eighteen pence a pound; and most of the time that this part of the trade is carried on, the prices are from five to nine shillings per stone; the value rising and falling according to the plenty of fish, or the prospect of a fair or foul wind. Some fish are sent in this manner to London the latter end of September, when the weather grows cool; but then the fish are full of large roes, grow very thin-bellied, and are not esteemed so palatable. The season for fishing in the Tweed begins January 10, and ends October 10; yet the corporation of Berwick (who are conservators of the river) indulge the fishermen with a fortnight past that time, on account of the change of the style. There are on the river 41 considerable fisheries, extending upwards, about 14 miles from the mouth (the others above being of no great value,) which are rented for near 5400*l.* per annum; the expence attending the servants' wages, nets, boats, &c. amounts to 5000*l.* more; which together makes up the sum 10,400*l.* Now, in consequence, the produce must defray all, and no less than 20 times that sum of fish will effect it; so that 208,000 salmon must be caught there one year with another. Scotland possesses great numbers of fine fisheries on both sides of that kingdom. The Scotch in early times had most severe laws against the killing of this fish: for the third offence was made capital, by a law of James IV. Before that, the offender had power to redeem his life. They were thought in the time of Henry VI. a present worthy of a crowned head; for in that reign the queen of Scotland sent to the duchess of Clarence 10 casks of salted salmon, which Henry directed to pass duty-free. The salmon are cured in the same manner as at Berwick, and a great quantity is sent to London in the spring; but after that time, the adventurers begin to barrel and export them to foreign countries; but we believe that commerce is far less lucrative than it was in former times, partly owing to the great increase of the Newfoundland fishery, and partly to the general relaxation of the discipline of abstinence in the Romish church. Ireland (particularly the north) abounds with this fish; the most considerable fishery is at Cranna, on the river Ban, about a mile and a half from Coleraine. When I made the tour of that hospitable kingdom, says Mr. Pennant, in 1754, it was rented by a gentleman for 620*l.* a year; who assured me that the tenant, his predecessor, gave 1600*l.* per annum, and was a much greater gainer by the bargain, for the reasons before-mentioned, and on account of the number of poachers who destroy the fish in the fence-months. The mouth of the river faces the north; and is finely situated to receive the fish that roam along the coast in search of an inlet into some fresh water, as they do all along that end of the kingdom which opposes itself to the northern ocean. We have seen near Ballicastle, nets placed in the sea at the foot of the promontories that jut into it, which the salmon strike into as they are wandering close to shore; and numbers are taken by that method. In the Bann they fish with nets 18 score yards long, and are continually drawing night and day the whole season, which we think lasts about four months, two sets of 16 men each alternately relieving one another. The best drawing is when the tide is coming in; we were told, that in a single draught there were once 840 fish taken. A few miles higher up the river is a weir, where a considerable number of fish that escape the nets are taken. We were lately informed, that in the year 1760, about 320 tons were taken in the Cranna fishery." With regard to the manner of

of curing salmon when the fish are taken, they are opened along the back, the guts and gills, and the greatest part of the bones removed, so as to make the inside as smooth as possible. They then salt the fish in large tubs for the purpose, where they lie a considerable time soaking in brine; and about October, they pack them close up in barrels, and send them to London or up the Mediterranean. They have also in Scotland a great deal of salmon salted in the common way, which after soaking in brine a competent time is well pressed, and then dried in smoke: this is called kipper, and is chiefly made for home consumption; and if properly cured and prepared, is reckoned very delicious.

STURGEON-FISHERY. The greatest sturgeon-fishery is in the mouth of the Volga, on the Caspian sea; where the Muscovites employ a great number of hands, and catch them in a kind of inclosure formed by huge stakes representing the letter Z repeated several times. These fisheries are open on the side next the sea, and close on the other, by which means the fish ascending in its season up the river, is embarrassed in these narrow angular retreats, and is easily killed with a harping-iron. Sturgeons, when fresh, eat deliciously; and in order to make them keep, they are salted or pickled in large pieces, and put in cags of from 30 to 50 pounds. But the great object of this fishery is the roe, of which the Muscovites are extremely fond, and of which is made the caviar, or kavia, so much esteemed by the Italians. See **KAVIA**.

TUNNY-FISHERY. The tunny (a species of Scomber, which see) was a fish well-known to the ancients, and made a great article of commerce; and there are still very considerable tunny-fisheries on the coasts of Sicily, as well as several other parts of the Mediterranean. The nets are spread over a large space of sea by means of cables fastened to anchors, and are divided into several compartments. The entrance is always directed, according to the season, towards that part of the sea from which the fish are known to come. A man placed upon the summit of a rock high above the water, gives the signal of the fish being arrived; for he can discern from that elevation what passes under the waters infinitely better than any person nearer the surface. As soon as notice is given that the shoal of fish has penetrated as far as the inner compartment, or the chamber of death, the passage is drawn close, and the slaughter begins. The undertakers of these fisheries pay an acknowledgement to the king, or the lord upon whose land they fix the main stay or foot of the tonnara; they make the best bargain they can; and till success has crowned their endeavours, obtain this leave for a small consideration; but the rent is afterwards raised in proportion to their capture. The tunny enters the Mediterranean about the vernal equinox, travelling in a triangular phalanx, so as to cut the waters with its point, and to present an extensive base for the tides and currents to act against and impel forwards. These fish repair to the warm seas of Greece to spawn, steering their course thither along the European shores, but as they return, approach the African coast; the young fry is placed in the van of the squadron as they travel. They come back from the east in May, and abound on the coast of Sicily and Calabria about that time. In autumn they steer northward, and frequent the neighbourhood of Amalsi and Naples; but during the whole season stragglers are occasionally caught. When taken in May, the usual time of their appearance in the Calabrian bays, they are full of spawn, and their flesh is then esteemed unwholesome, apt to occasion head-achs and flatulency; the milts and roes are particularly so at that season. To prevent these bad effects, the natives fry them in oil, and afterwards salt them. The quantity of this fish consumed annually in the two Sicilies almost exceeds the bounds of calculation. From the beginning of May to the end of October it is eaten fresh, and all the rest of the year it is in use salted. The most delicate part is the muzzel. The belly salted was called tarantallum, and accounted a great delicacy by the Romans; its present name is surra. The rest of the body is cut into slices, and put into tubs.

TURBOT-FISHERY. Turbots grow to a large size, viz. from 23 to 30 pounds. They are taken chiefly off the north coast of England, and others off the Dutch coast. The large turbot (as well as several other kinds of flat fish) are taken by the hook and line, for they lie in deep water; the method of taking them in weirs or staked nets being very precarious. When the fishermen go out to sea, each person is provided with three lines, which are coiled

on a flat oblong piece of wicker-work; the hooks being baited, and placed regularly in the centre of the coil. Each line is furnished with 14 score of hooks, at the distance of six feet two inches from each other. The hooks are fastened to the lines upon sneads of twisted horsehair 27 inches in length. When fishing, there are always three men in each coble, and consequently nine of these lines are fastened together, and used as one line, extending in length near three miles, and furnished with 2520 hooks. An anchor and a buoy are fixed at the first end of the line, and one more of each at the end of each man's lines; in all four anchors, which are commonly perforated stones, and four buoys made of leather or cork. The line is always laid across the current. The tides of flood and ebb continue an equal time upon our coast, and, when undisturbed by winds, run each way about six hours; they are so rapid that the fishermen can only shoot and haul their lines at the turn of the tide, and therefore the lines always remain upon the ground about six hours; during which the myxine glutinosa of Linnæus will frequently penetrate the fish that are on the hooks, and entirely devour them, leaving only the skin and bones. The same rapidity of tides prevents their using hand-lines: and therefore two of the people commonly wrap themselves in the sail, and sleep, while the other keeps a strict look-out, for fear of being run down by ships, and to observe the weather. For storms often rise so suddenly, that it is with extreme difficulty they can sometimes escape to the shore, leaving their lines behind. Besides the coble, the fishermen have also a five-men boat, which is forty feet long and fifteen broad, and twenty-five tons burden; it is so called, though navigated by six men and a boy, because one of the men is commonly hired to cook, &c. and does not share in the profits with the other five. This boat is decked at each end, but open in the middle, and has two large lug-sails. All our able fishermen go in these boats to the herring-fishery at Yarmouth in the end of September, and return about the middle of November. The boats are then laid up till the beginning of Lent, at which time they go off in them to the edge of the Dogger, and other places, to fish for turbot, cod, ling, skates, &c. They always take two cobbles on board; and when they come upon their ground, anchor the boat, throw out the cobbles, and fish in the same manner as those who do go from the shore in a coble; with this difference only, that here each man is provided with double the quantity of lines, and instead of waiting the return of the tide in the coble, they return to their boat and bait their other lines; thus hawling one set and shooting another every turn of tide. They commonly run into harbour twice a week to deliver their fish. The best bait is fresh herring cut in pieces of a proper size: the five-men boats are always furnished with nets for taking them. Next to herrings are the lesser lampreys. The next baits in esteem are small haddocks cut in pieces, sand-worms, and limpets, here called fiddlers; and when none of these can be had, they use bullock's liver. The hooks are two inches and a half long in the shank, and near an inch wide between the shank and the point. The line is made of small cording, and is always tanned before it is used. Turbots are extremely delicate in their choice of baits; for if a piece of herring or haddock has been twelve hours out of the sea, and then used as bait, they will not touch it.

FISHERY, WHALE. For the natural history of the whale, the importance of the whale-fishery to Britain, and other particulars, see the article **BALÆNA**. We shall here only remark, that the legislature, justly considering that trade as of great national importance, bestowed on it at different periods very considerable encouragement. In particular, every British vessel of 200 tons or upwards, bound to the Greenland seas on the whale-fishery, if found to be duly qualified according to the act, obtained a licence from the commissioners of the customs to proceed on such voyage; and on the ship's return, the master and mate making oath that they proceeded on such voyage and no other, and used all their endeavours to take whales, &c. and that all the whale-fins, blubber, oil, &c. imported in their ship, were taken by their crew in those seas, there was allowed 40s. for every ton, according to the admeasurement of the ship. It was afterwards found, however, that so great a bounty was neither necessary to the success of the trade, nor expedient with regard to the public. In 1786, therefore, the act, conferring the said emoluments being upon the point of expiring, the subject was brought under the consideration of parliament; and it was proposed to continue the former measures, but

but with a reduction of the bounty from 40s. to 30s. In proposing this alteration, it was stated, "that the sums which this country had paid in bounties for the Greenland fishery amounted to 1,265,461l.; that in the last year we had paid 94,858l.; and that, from the consequent reduction of the price of the fish, the public at present paid 60 per cent. upon every cargo. In the Greenland fishery there were employed 6000 seamen, and these seamen cost government 13l. 10s. per man per annum, though we were never able to obtain more than 500 of that number to serve on board our ships of war. Besides, the vast encouragement given to the trade had occasioned such a glut in the market, that it was found necessary to export considerable quantities; and thus we paid a large share of the purchase-money for foreign nations, as well as for our own people, besides supplying them with the materials of

several important manufactures." This proposition was opposed by several members, but was finally carried; and the propriety of the measure became very soon apparent. At that time (1786) the number of ships employed from England in the whale-fishery to Davis's Straights and the Greenland seas amounted to 139, besides 15 from Scotland. The proposed alteration took place the next year (1787); and notwithstanding the diminution of the bounty, the trade increased; the number of ships employed the same year from England amounting to 217, and the next year (1788) to 222. The whale-fishery has of late years been considerably indebted to the introduction of a new kind of harpoon, called the gun-harpoon, which the Society for the Encouragement of Arts, have exerted themselves to bring into general use.

FISHING.

FISHING, in general, the art of catching fish, whether by means of nets or spears, or of the line and hook. That which is performed by the net, spear, or harpoon, for fish that go in shoals, has been explained in the preceding articles. That performed by the rod, line, and hook, is usually termed angling; see that article: and for the particular manner of angling for the different kinds of fish, see their respective names, and the following articles:

1. The barbel, so called on account of the barb or beard that is under his chaps (see *CYPRINUS*), though a coarse fish, gives considerable exercise to the angler's ingenuity. They swim together in great shoals, and are at their worst in April, at which time they spawn, but soon come in season: the places whither they chiefly resort, are such as are weedy and gravelly rising grounds, in which this fish is said to dig and root with his nose like a swine. In the summer he frequents the strongest and swiftest currents of waters; as deep bridges, weirs, &c. and is apt to settle himself amongst the piles, hollow places, and moss weeds, and will remain there immoveable: but in winter he retires into deep waters, and helps the female to make a hole in the sands to hide her spawn in, to kinder its being devoured by other fish. He is a very curious and cunning fish; for if his baits are not sweet, clean, well scoured, and kept in sweet moss, he will not bite; but if those are well-ordered and carefully kept, he will bite with great eagerness. The best bait for him is the spawn of a salmon, trout, or any other fish; or a piece of chandler's greaves which has been boiled and washed; he will also take a large lob-worm; and if you would have good sport with him, bait the places where you intend to fish with it a night or two before with tallow-chandler's greaves; and the earlier in the morning, or the later in the evening, that you fish, the better it will be. Your rod and line must be both strong and long, with a running plummet on the line; and let a little bit of lead be placed a foot or more above the hook, to keep the bullet from falling on it: so the bait will be at the bottom, where they always bite; and when the fish takes the bait, your plummet will lie and not choke him. By the bending of your rod you may know when he bites, as also with your hand you will feel him make a strong snatch; then strike, and you will rarely fail, if you play him well; but if you manage him not dexterously he will break your line. The best time for fishing is about nine in the morning, and the most proper season is the latter part of May, June, July, and the beginning of August.

2. The bleak is an eager fish, caught with all sorts of worms bred on trees or plants; as also with flies, paste, sheep's blood, &c. Bleak may be angled for with half a score of hooks at once, if they can be all fastened on: he will also in the evening take a natural or artificial fly. If the day is warm or clear, there is no fly so good for him as the small fly at the top of the water, which he will take at any time of the day, especially in the evening. But if the day be cold and cloudy, gentles and caddis are the best; about two feet under water. But the best method is with a drab-

ble, thus: tie eight or ten small hooks across a line, two inches above one another; the biggest hook the lowermost, (whereby you may sometimes take a better fish,) and bait them with gentles, flies, or some small red worms, by which means you may take half a dozen or more at a time; but when you have them they are not worth catching, except as a bait for a pike, trout, &c.

3. For the bream observe the following directions, which will also apply to carp, tench, or perch fishing. Procure about a quart of large red worms: put them into fresh moss well washed and dried every three or four days, feeding them with fat mould and chopped fennel, and they will be thoroughly scoured in about three weeks.

Let your lines be silk, and silk-worm gut at the bottom; let the floats be either swan-quills or goose-quills. Let your plumb be a piece of lead in the shape of a spear, with a small ring at the point of it; fasten the lead to the line, and the line-hook to the lead; about ten or twelve inches space between lead and hook will be enough; and take care the lead be heavy enough to sink the float. Having baited your hook well with a strong worm, the worm will draw the hook up and down in the bottom, which will provoke the bream to bite the more eagerly. It will be best to fit up three or four rods and lines in this manner, and set them as will be directed, and this will afford you much the better sport. Find the exact depth of the water if possible, that your float may swim on its surface directly over the lead; then provide the following ground-bait. Take about a peck of sweet gross-ground-malt, and having boiled it a very little, strain it hard through a bag, and carry it to the water-side where you have sounded; and into the place where you suppose the fish resort, there throw in the malt by handfuls squeezed hard together, or rather mixed with a little clay, that the stream may not separate it before it comes to the bottom; and be sure to throw it in at least a yard above the place where you intend the hook shall lie, otherwise the stream will carry it down too far. Do this about nine o'clock at night, keeping some of the malt in the bag, and go to the place about three the next morning, but approach very warily, lest you should be seen by any of the fish; for it is said that they have their sentinels watching on the top of the water, while the rest are feeding below. Having baited your hook so that the worm may crawl to and fro, the better to allure the fish to bite, cast it in at the place where you find the fish to stay most, which is generally in the broadest and deepest part of the river, so that it may rest about the midst of your ground-bait. Cast in your second line so that it may rest a yard above that, and a third about a yard below it. Let your rods lie on the bank with some stones to keep them down at the great ends; and then withdraw yourself, yet not so far but that you can have your eye upon all the floats; and when you see one bitten and carried away, do not be too hasty to run in, but give time to the fish to tire himself, and then touch him gently. When you perceive the float sink, creep to the water-side,

and give it as much line as you can. If it is a bream or carp, he will run to the other side. Strike him gently, and hold your rod at a bend a little while, but do not pull, for then you will spoil all; but you must tire them before they can be landed, for they are very shy. If there are any carp in the river, it is an even chance that you take one or more of them; but if there are any pike or perch, they will be sure to visit the ground-bait, though they will not touch it, being drawn together by the great resort of the small fish, and until you remove them, it is in vain to think of taking the bream or carp. In this case, bait one of your hooks with a small bleak, roach, or gudgeon, about two feet deep from your float, with a little red worm at the point of your hook, and if a pike is there he will be sure to snap at it. This sport is good till nine o'clock in the morning, and in a gloomy day till night; but do not frequent the place too much, lest the fish grow shy.

4. The carp. A person who angles for carp, must arm himself with abundance of patience, because of their extraordinary subtilty and shyness; they always choose to lie in the deepest places either of ponds or rivers, where there is but a small running stream. Further, observe, that they will seldom bite in cold weather; and you cannot be too early or too late at the sport in hot weather; yet if he bite you need not fear his hold, for he is one of those leather-mouthed fish that have their teeth in the throat. Neither must you forget, in angling for him, to have a strong rod and line; and since he is so very wary, it will be proper to entice him, by baiting the ground with a coarse paste. He seldom refuses the red worm in March, the caddis in June, or the grasshopper in July, April, and September. This fish, however, does not only delight in worms, but also in sweet paste, of which there is great variety; the best is made of honey and sugar mixed up with flour, some veal minced fine, and a little cotton or white wool to make it adhere to the hook. Some of it ought to be thrown into the water a few hours before you begin to angle; neither will small pellets thrown into the water two or three days before be worse for this purpose, especially if chickens' guts, garbage, or blood mixed with bran and cow-dung, are also thrown in. If you fish with gentles, anoint them with honey. Honey and crumbs of wheat-bread, mixed together, make also a very good paste; or pellets of wheat-bread alone will answer very well. In taking a carp either in a pond or river, if the angler intends to add profit to his pleasure, he must take a peck of ale-grains, and a good quantity of any blood to mix with the grains; baiting the ground with it where he intends to angle. This food will wonderfully attract the scale-fish, as carp, tench, roach, dace, and bream. Let him angle in a morning, plumbing his ground, and angling for carp with a strong line: the bait must be either paste or a knotted red worm: and by this means he will have sport enough.

5. The pike is a very long-lived creature, and if we may credit Sir Francis Bacon, or Gesner, that famous naturalist, he outlives all other fish; and is a tyrant of the fresh-waters, as the salmon is the king thereof. The larger the pike, the courser the food, the smaller being ever best; contrary to the nature of eels, which improve their goodness by their bulk and age. He is a melancholic fish, because he never swims in shoals, but rests himself alone; and he is as bold as any fish whatever, if we may believe report, which informs us a pike hath been known to fight with an otter for a carp he had taken, and was carrying out of the water. Another bit a mule by the lip as he was drinking, and stuck thereunto so fast, that by that means the owner of the mule took him. Another bit a maid by the foot as she was washing. He will frequently devour his own kind; from whence we suppose he may obtain the name of a fresh-water wolf. As the pike is in nature like the hawk, a bird of prey, so he is like her in generation, neither of them breeding but once a year: the pike spawns between February and March. The best pikes are found in rivers, the worst in meres or ponds. His common food is either pickerel weed, frogs, or what fish he can procure. This pickerel weed some say, both feeds and breeds them. There are two ways of fishing for the pike; first by the ledger, secondly by the walking-bait. The ledger-bait is fixed in one certain place, whilst the angler may be absent; and this must be a living bait, either fish or frog. Of fish the best are a dace, roach, or perch: for frogs, the yellowest are the best. How to keep them alive on your hook, your own ingenuity will inform you. When you intend to use the ledger-bait, if it be a fish, stick your hook through his up-

per lip; and then fastening it to a strong line at least twelve or fourteen yards in length; tie the other end of the line either to some stake in the ground, or to some bough of a tree near the pike's usual haunt, or where you think it is likely he may come. Then wind your line on a forked stick, (big enough to keep the bait from drawing it under water) all except about half a yard or somewhat more; and your stick having a small cleft at the end, fasten your line therein; but so, that when the pike comes, he may easily draw it forth, and have line enough to go to his hold and pouch. If your bait be a frog, put the arming-wire in at his mouth, and out at his gills; and then with a fine needle, and silk sow the upper part of his leg with one stitch only to your arming-wire, or tie his leg above the upper joint to the wire; but as gently as you can, lest you hurt him. Excellent sport is made with living baits tied about the bodies of two or three couple of ducks, driven over a place where store of pikes have frequented. The pike is often observed to strike so violently at the living bait, that being hung he hath drawn the duck clear under water. The like may be done with such baits tied to bladders, suffering them to float down the river, whilst you mind your sport walking on its banks. The next way of angling for a pike is with a trowl with a winch to wind it up withal. As this fish is very strong, so in proportion must be your tackle; and your rod must not be very slender, where must be placed a ring for your line to run through. Your line must be composed of silk two yards and a quarter next the hook, which must be double, and strongly armed with a wire about seven inches: the rest of your line may be strong shoemakers-thread. Upon the shank of the hook fasten some smooth lead; and having placed your hook in the mouth of a minnow, dace, or roach; with your lead sink your bait with his head downward. Having so done, cast your bait up and down: if you feel him at the hook, give him length enough to run away with the bait and pouch it; which when you think he hath done, strike him with a smart jerk, and so continue your sport with him as long as you shall think fit. A pike will bite at all bait, excepting the fly, and bites best about three in the afternoon in clear water with a gentle gale, from the middle of summer to the end of autumn; he then bites best in still places or a gentle stream: but in winter he bites all the day long. In the latter end, and beginning of the spring, he bites most eagerly early in the morning, and late in the evening.

6. Salmon and trout fishing are nearly alike. The trout is caught with a worm, a minnow, or a fly; but the only elegant sport of this kind is that with the artificial fly.

7. The gudgeon is a small fish, of very delicious taste. It spawns three or four times in the summer season, and feeds in streams, slighting all kinds of flies, but is easily taken with a small red worm, fishing near the ground; and being a leather-mouthed fish, will not easily get off the hook when struck. The gudgeon may be either fished with a float, the hook being on the ground, or by hand, with a running line on the ground without cork or float. He will bite well at wasps, gentles, and cadworms; and a person may fish with two or three hooks at the same time. Before you angle for gudgeons, stir up the sand or gravel with a long pole, which will make them gather to the place, and bite the faster.

8. The tench is a fine fresh-water fish, having very small scales, but large smooth fins, with a red circle about the eyes, and a little barb hanging at each corner of the mouth. It takes more delight among weeds in ponds than in clear rivers, and loves to feed in foul water. His slime is said to have a healing quality for wounded fish, upon which he is called the fishes' physician. When carp, pike, &c. are hurt, it is said they find relief by rubbing themselves against the tench. The season for catching this fish is June, July, and August, very early and late, or even all night, in the still part of the rivers. The bait is a large red worm, at which he bites eagerly, especially if dipped in tar. He delights in all sorts of paste made of strong-scented oils, or tar, or a paste of brown-bread and honey; nor does he refuse the cadworm, lobworm, flagworm, green gentles, cod bait, or soft boiled bread-grain.

9. Smelts are caught at high-tide during the summer and autumn months, with a hook and line, about Limehouse and Poplar. They fish with about ten hooks on the same line, at different depths, each baited with a small piece of smelt, and sometimes two or three are caught at once.

An Epitome of the whole ART of FISHING, wherein are shewn at one view, the Harbours, Seasons, and Depths, for catching all sorts of Fish usually angled for; also the various Baits for each, so digested as to contain the Essence of all the Treatises ever written on the subject, exempt from the superfluities, which tend more to perplex than instruct.

Names.	Where found.	Seasons.	Time to angle.	Depth from ground.	Proper Baits.			
					Flies No.	Pastes. No.	Worms. No.	Fish & Insects. No. 8
Bream.....	rough str. river or mid. pond.	April to Mich.	sun-rise to 9 3 to sun-set	touch ground	—	1 3	1 to 7	—
Barbel.....	gravel-banks in currents under bridges	April to Aug.	very early or late	ditto	—	2	2 6 7	—

Umber or Grayling }	clay-bottom, swift stream	all the year	all day	cold weather, 6 to 9 inch. hot weath. top to mid-wat.	1 to 5	—	all	1 8

Description of proper Baits for the several sorts of Fish referred to in the foregoing Table.

Flies. 1. Stone-fly, found under hollow stones at the side of rivers, is of a brown colour, with yellow streaks on the back and belly, has large wings, and is in season from April to July. 2. Green drake, found among stones by river-sides, has a yellow body ribbed with green, is long and slender, with wings like a butterfly, his tail turns on his back, and from May to Midsummer is very useful. 3. Oak-fly found in the body of an old oak, or ash, with its head downwards, is of a brown colour, and excellent from May to September. 4. Palmer-fly or worm, rather a hairy caterpillar, found on leaves of plants, and when it comes to a fly is excellent for trout. 5. Ant-fly, found in ant-hills from June to September. 6. The May-fly is to be found playing by the river-side, especially against rain. See EPHEMERA. 7. The black-fly is to be found upon every hawthorn after the buds are fallen off. Almost the only sport in fishing that may be called so, is fly-fishing. The fly is either natural or artificial.

I. Natural flies are innumerable. The most usual for this purpose are mentioned in the above lines. There are two ways to fish with natural flies; either on the surface of the water, or a little underneath it. In angling for chevin, roach, or dace, move not your natural fly swiftly, when you see the fish make at it; but rather let it glide freely towards him with the stream: but if it be in a still or slow water, draw the fly slowly sideways by him, which will make him eagerly pursue it.

II. The artificial fly is best used when the waters are so troubled by the winds, that the natural fly cannot be seen nor rest upon them. Of artificial flies there are reckoned no less than twelve sorts, of which the following are the principal: 1. For March, the dun-fly, made of dun-wool, and the feathers of the partridge's wing, or the body made of black-wool, and the fea-

thers of a black drake. 2. For April, the stone-fly, the body made of black wool, with a little yellow under the wings and tail. 3. For the beginning of May, the ruddy fly, made of red wool, and bound about with black silk, with the feathers of a black capon hanging dangling on his sides next his tail. 4. For June, the greenish fly, the body made of black wool, with a yellow list on either side, the wings taken off the wings of the buzzard, bound with black broken hemp. 5. The moorish fly, the body made of dusky wool, and the wings made of the blackish mail of a drake. 6. The tawny fly, good till the middle of June, the body made of tawny wool, the wings made contrary one against the other, of the whitish mail of a white drake. 7. For July, the wasp-fly, the body made of black wool, cast about with yellow silk, and the wings of drakes' feathers. 8. The steel-fly, good in the middle of July, the body made with greenish wool, cast about with the feathers of a peacock's tail, and the wings made of those of the buzzard. 9. For August, the drake-fly, the body made with black wool cast about with black silk, his wings of the mail of a black drake with a black head. The May-fly is also excellently imitated by the tackle-makers.

The best rules for artificial fly-fishing are. 1. To fish in a river somewhat disturbed with rain: or in a cloudy day, when the waters are moved by a gentle breeze; the south wind is best; and if the wind blows high, yet not so but that you may conveniently guard your tackle, the fish will rise in plain deeps: but if the wind is small, the best angling is in swift streams. 2. Keep as far from the water-side as may be; fish down the stream with the sun at your back, and do not disturb the water with your line. 3. Ever angle in clear rivers with a small fly and slender wings; but in muddy places use a larger. 4. When after rain the water becomes brownish, use an orange fly; in a clear day, a light-coloured fly; a dark fly for dark waters, &c. 5. Let the line be at least

least twice as long as the rod, unless the river is encumbered with trees. 6. For every sort of fly, have several of the same, differing in colour, to suit with the different complexions of several waters and weathers. 7. Have a nimble eye and active hand, to strike presently with the rising of the fish, or else he will be apt to throw out the hook. 8. Let the fly fall first into the water, and not the line, which will scare the fish. 9. In slow rivers, or still places, cast the fly across the river, and let it sink a little in the water, and draw it gently back with the current. Salmon-flies should be made with their wings standing one behind the other, whether two or four. This fish delights in the gaudiest colours that can be; chiefly in the wings, which must be long, as well as the tail. The best wing is the hackle of the golden pheasant.

PASTES.—1. Take the blood of a sheep, and mix it with honey and flour to a proper consistence. 2. Take old cheese grated, a little butter sufficient to work it, and colour it with saffron; in winter use rusty bacon instead of butter. 3. Crumbs of bread chewed or worked with honey or sugar, moistened with gum-water. 4. Bread chewed, and worked in the hand till it becomes stiff, which with a little cotton wool to make it stick on the hook is the best of all.

WORMS.—1. The earth-bob, found in sandy ground after ploughing; it is white, with a red head, and bigger than a gentle; another is found in heathy ground with a blue head. Keep them in an earthen vessel well covered, and a sufficient quantity of the mould they harbour in. They are excellent from April to November. 2. Gentles, to be had from putrid flesh; let them lie in wheat-bran a few days before used. 3. Flag-worms, found in the roots of flags: they are of a pale yellow colour, are longer and thinner than a gentle, and must be scoured like them. 4. Cow-dung, bog, or clap-bait, found under cow-dung from May to Mi-

chaelmas; it is like a gentle, but larger. Keep it in its native earth like the earth-bob. 5. Cadis-worm, or cod-bait, found under loose stones in shallow rivers: they are always covered with a case of sticks or small gravel, and when drawn out of their case are yellow, bigger than a gentle, with a black or blue head, and are in season from April to July. Keep them in flannel bags. 6. Lob-worm, found in gardens: it is very large, and has a red head, a streak down the back, and a flat broad tail. 7. Marsh-worms, found in marshy ground; keep them in moss ten days before you use them: their colour is a blueish red; are a good bait from March to Michaelmas. 8. Brandling or red worms, found in rotten dunghills and tanners' bark; they are red or rather striped worms, very good for all small fish, have sometimes a yellow tail, or a smaller sort are called tag-tails or gilt-tails, they have not the annular stripe of the brandling.

FISH AND INSECTS.—1. Minnow. 2. Gudgeon. 3. Roach. 4. Dace. 5. Smelt. 6. Yellow frog. 7. Snail slit. 8. Grass-hopper. Floats, are little appendages to the line, used for fishing at bottom, and serving to keep the hook and bait suspended at the proper depth, to discover when the fish have hold of them, &c. Of these there are many kinds: some made of quills, which are the best for slow waters; but for strong streams sound cork, without flaws or holes, bored through with a hot iron, into which is put a quill of a fit proportion, is preferable; the cork should be shaped to a pyramidal form, and made smooth. The fishing-hook, in general, ought to be long in the shank, somewhat thick in the circumference, the point even and straight; the bend should be in the shank. For setting the hook on, use strong but small silk, laying the hair on the inside of the hook; for if it is on the outside, the silk will fret and cut it asunder.

FISHING-LINE, a line made either of hair twisted, or silk; or the Indian grass. The best colours are the sorrel, white, and grey; the two last for clear waters, the first for muddy ones. The pale watery green colour is given artificially, by steeping the hair in a liquor made of alum, soot, and the juice of walnut leaves, boiled together.

FISHING-ROD, a long slender rod or wand, to which the line is fastened, for angling. Of these there are several sorts; as, 1. A troller, or trolling rod, which has a ring at the end of the rod, for the line to go through when it runs off a reel. 2. A whipper, or whipping rod; a top-rod, that is weak in the middle, and top heavy, but all slender and fine. 3. A dropper; which is a strong rod and very light. 4. A snapper, or snap-rod; which is a strong pole, peculiarly used for the pike. 5. A bottom-rod; being the same as the dropper, but somewhat more pliable. 6. A sniggling or procking stick; a forked stick, having a short strong line, with a needle, baited with a lobe worm: this is only for eels in their holes.

FISH-RIVER, GREAT, a river of Africa, which divides Caffraria from the country of the Hottentots, and falls into the Indian Ocean, in Lat. 30. 30. S.

FISMES, a town of France, in the department of Marne, on the Vesle, 15 miles N. W. of Rheims.

FISSATO, a town of Africa, in Tripoli, 90 miles W. of Tripoli. Lon. 12. 0. E. Lat. 33. 50. N.

FISSURE OF A BONE, in surgery, is when it is divided either transversely or longitudinally, not quite through, but cracked after the manner of glass, by any external force. See **SURGERY**.

FISSURES IN THE EARTH, certain interruptions, that in an horizontal or parallel manner divide the several strata of which the body of our terrestrial globe is composed.

FISTELLA, or **FEEZA**, a fortified town of Morocco, in the province of Tedela, 125 miles N. E. of Morocco.

FISTULA, in the ancient music, an instrument of the wind kind, resembling our flute or flageolet. The principal wind instruments of the ancients, were the tibia and the fistula.

FISTULA, in farriery. See **FARRIERY**.

FISTULA, in surgery, a deep, narrow ulcer, generally arising from abscesses. It differs from a sinus, in being callous, the latter not. See **SURGERY**.

VOL. II.—NO. 84.

FISTULARIA, the **TOBACCO-PIPE FISH**, in natural history; a genus of fishes of the order abdominales. Snout cylindrical; jaws distant from the eyes; gill-membrane with seven rays; body tapering from the jaws to the tail. There are three species. *F. tabacaria*, or the slender fistularia, grows to the length of three feet, and is found on the coasts of Brazil, by the inhabitants of which it is eaten, though not much esteemed. It lives principally upon smaller fishes, insects, and worms. The two other species are natives of the Indian seas.

FIT. See **PAROXYSM**.

FITCHI, a kingdom of Japan, E. of the isle of Nippon.

FITCH, in husbandry, is more generally known by the name of chick-pea. See **CICER**. Fitches are cultivated either for feeding cattle, or improving the land. They make a wholesome and nourishing food, whether given in the straw or threshed out. When sown only to improve the soil, they are ploughed in just as they begin to blossom, by which means a tough stiff clay soil is much enriched.

FITCHET, FITCHEW, or FITCHAT, in zoology. See **MUSTELA**.

FITCHY, [from *fishé*, Fr. *i. e.* fixed,] in heraldry, a term applied to a cross when the lower branch ends in a sharp point. The reason of it Mackenzie supposes to be, that the Christians were wont to carry crosses with them wherever they went; and when they stopped on their journey at any place, they fixed those portable crosses in the ground for devotion's sake.

FITZ, [Norman, from *filz*, a son, Fr.] a son. Only used in law and genealogy: as Fitz-herbert, the son of Herbert; Fitz-thomas, the son of Thomas; Fitzroy, the son of the king. It is commonly used of illegitimate children.

FITZHERBERT, Sir ANTHONY, a very learned lawyer in the reign of king Henry VIII. descended of an ancient family, and born at Norbury in Derbyshire. He was made a judge of the court of common pleas in 1523; and distinguished himself by many valuable works, as well as by such an honourable discharge of the duties of his office, as made him esteemed an oracle of the law. His writings are, *The Grand Abridgment: The Office and Authority of Justices of Peace: The Office of Sheriffs, Bailiffs of Liberties, Escheators, Constables, Coroners, &c.: Of the Diversity of Courts: The New Natura Brevium: Of the Surveying of Lands: and The Book of Husbandry*. He died in 1538.

5 U

FITZSTEPHEN,

FITZSTEPHEN, WILLIAM, a learned monk of Canterbury, of Norman extraction, but born of respectable parents in London, in the 12th century. Being attached to Archbishop Becket, he was present at the time of his murder. See **BECKET**. In 1174, he wrote in Latin, "The Life of Saint Thomas, Archbishop and Martyr;" in which, as Becket was a native of the metropolis, he introduces a description of London, with a detail of the manners and usages of the citizens, which is deservedly considered as a great curiosity, being the earliest professed account of London extant. He died in 1191.

FIVE CHURCHES, a town of Hungary, 85 miles S. of Buda.
